Ten Guineas per annum ..	Thirty Volumes at a time.

The Violin.—Gratis and postage free,

a large CATALOGUE of new Standard and Popular MUSIC for the VIOLIN, Tenor Violoncello, and Contra Basso, including Duets, Trios, Quartets, Septets, Symphonies, and Overtures for a full Orchestra, with Studies, Exercises, Instruction Books, and Treatises on Stringed Instruments. 12th Edition. Apply to Her Majesty's Music Publishers, Robert Cocks and Co., 6, New Burlington-street.

CHURCHILL'S MANUALS.

Foolscap octavo, cloth, price 12s. 6d. each Volume.

Aggregate Sale, 105,000 Copies.

Anatomy—Mr. ERASMUS WILSON.

Chemistry—Mr. FOWNES.

Dental Surgery—Mr. TOMES.

Materia Medica—Dr. ROYLE and Dr. HEADLAND.

Medicine—Dr. BARLOW.

Medical Jurisprudence—Dr. TAYLOR.

Microscope—Dr. CARPENTER.

Natural Philosophy—Dr. G. BIRD and Mr. BROOKE.

Obstetrics—Dr. TYLER SMITH.

Ophthalmic Medicine—Mr. WHARTON JONES.

Pathological Anatomy—Dr. H. JONES and Dr. SIEVERING.

Physiology—Dr. CARPENTER.

Poisons—Dr. TAYLOR.

Surgery—Mr. FERGUSSON.

JOHN CHURCHILL, New Burlington-street.

The Price of the Medical Register

having been REDUCED, by order of the Medical Council, it may now be had at the Registration Office, 32, Soho-square, W., at 4s. per copy, or post free 4s. 6d.; and every person who has paid 7s. 6d. for the same will be entitled to receive gratis a copy of the Register for 1860.

The Cheapest London House for every

description of the most improved and best London-made SURGICAL INSTRUMENTS AND APPLIANCES. Best Catheters, 1s. 6d.; Bougies, 1s.; Speculums, 3s. 6d.; Enemas, from 5s. to 15s. Spiral Elastic Stockings, Bandages, Belts, Trusses, Urinals, Air Beds, Cushions, Artificial Limbs, Crutches, Dr. Pretty's improved Chloroform Inhaler and Uterine Compress, &c. WOLLOMS, (from COXETER'S), 239, Tottenham-court-road.

Newbery's Cod-Liver Oil Cakes.

"The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered."—Medical Times and Gazette, 12th February, 1859. Packets, 1s. 9d. and 3s. F. NEWBERY and SONS (Proprietors of the "PULVIS JACOBI VER., NEWBERY'S"), 45, St. Paul's-Churchyard, London. ESTABLISHED A. D. 1746.

Carriages, New and Second-hand, of

superior style, sterling quality, and finest finish at reasonable rates, for cash, credit, job, or exchange. Circular of prices on application. Credit given when required. Buyers should take carriages on trial, with power to purchase by yearly payments, and thus prove them. OFFORD'S PATENT MEDICAL MAN'S BROUGHAM MANUFACTORY, 79, WELLS-STREET, OXFORD-STREET.

H. Silverlock's Medical Label Ware-

HOUSE, Letter-Press, Copper-plate, and Lithographic Printing Offices, Wardrobe-terrace, Doctors'-commons, London, E.C. H. SILVERLOCK'S stock of Labels for Dispensing purposes having been recently revised and enlarged, now consists of upwards of 800 different kinds. Yellow and Green Labels for Drug Bottles, Drawers, &c., at per book or dozen: a Book, containing a selection in general use in Surgeries or Dispensaries, 10s. 6d. Priced Catalogues of the above may be had, post free, on application. Printing of every Description at Moderate Prices.

WINES FROM SOUTH AFRICA.

Denman, Introducer of the South

AFRICAN PORT, SHERRY, &c. 20s. PER DOZEN, BOTTLES INCLUDED. A PINT SAMPLE OF EACH FOR 24 STAMPS. Wine in cask forwarded free to any Railway-station in England. EXCELSIOR BRANDY, Pale or Brown, 15s. per gallon, or 30s. per dozen. Terms Cash. Country orders must contain a remittance. Cross cheques "Bank of London." Price Lists, with Dr. Hassall's analysis, forwarded on application. JAMES L. DENMAN, 65, Fenchurch-st., corner of Railway-place, London.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, previous, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W. The Profession, Trade, and Hospitals, supplied.

S. Bowles, late Windsor & Co., Phial

and BOTTLE MERCHANTS, Dealers in Druggists' Sundries, &c., 6, James-street, Covent-garden, W.C. The cheapest house in London for every description of Medical Glass of the best quality. Samples and Prices forwarded free on application.

Superphosphate of Iron and Super-

PHOSPHATE OF IRON and LIME. New Remedial Agents introduced to the notice of the Profession at the Meetings of the Medical Society of London, and now extensively employed by the most eminent members of the Medical Profession. The Syrup is the most eligible mode of administering these valuable Remedial Agents. Mr. GREENISH will be happy to forward a variety of cases which have been furnished to him, where its success has been most marked, and which will serve to indicate where it may be most advantageously employed.—20, New-street, Dorset-square.

"PULVIS JACOBI VER., NEWBERY'S"

Diphtheria, Fevers, Hooping Cough,

&c.—We beg to caution the Profession against imitations of this invaluable Medicine, for so many years prescribed as "Pulvis Jacobi Ver." but to which it is now necessary to add the name "NEWBERY'S," to secure prescribers against the SUBSTITUTION of articles advertised as James' Powder, BUT WHICH HAVE NOTHING IN CHARACTER, DOSE, OR EFFECT, with the original article, which has been sold by the Newbery Family continuously since its introduction in 1746.

Price, for dispensing: 1 oz. bottles, 9s.; ½ oz. do. 3s. 4d.

45, St. Paul's-churchyard, London. (Signed) F. NEWBERY & SON.

Williams and Son's Pure Glycerine

SOAP. Analysed by Dr. Hofmann, F.R.S., and Professor Redwood, Ph.D., strongly recommended by many eminent members of the Medical Profession, and favourably noticed by the following Medical Journals:—

THE LANCET.
THE MEDICAL TIMES AND GAZETTE.
THE BRITISH MEDICAL JOURNAL.
THE MEDICAL CIRCULAR.
EDINBURGH MEDICAL JOURNAL.
THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate skin (whether arising from disease or otherwise), and is admirably adapted for nursery use. May be had of all respectable Chemists, Perfumers, &c. SOAP-WORKS, CLERKENWELL, LONDON, E.C.

Mr. Howard, Surgeon-Dentist, 52,

FLEET-STREET, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without Springs, Wires, or Ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR or DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed Teeth stopped and rendered sound and useful in mastication. 52, Fleet-street. At home from Ten till Five.

Struve's Seltzer, Marienbad, Vichy,

KISSINGEN, and other MINERAL WATERS.—Under her Majesty's especial Patronage.—ROYAL GERMAN SPA, BRIGHTON, STRUVE'S PUMP-ROOM and PROMENADES, offering every facility for a Course of Mineral Waters, as perfect and beneficial as at the natural springs, are NOW OPEN, for the Thirty-fifth Season. A prospectus, with the highest Medical testimonials, may be obtained gratis, at the Pump-room, or from George Waugh and Co. Chemists to the Queen, 177, Regent-street (westside), London, and other respectable houses in London and the provincial towns, where orders for Struve's Bottled Mineral Waters continue to be executed.

CAUTION.—The success obtained by Struve's Mineral Waters, owing to their perfect identity with those of the natural springs, has induced several parties to attempt imitations, sold as "Brighton Seltzer," "Brighton Vichy," &c., an analysis of some of which has shown an utter disregard of their true chemical composition. To distinguish Struve's Waters from all others, every bottle has a label and red ink stamp over the cork, each bearing Struve's name, without which name none is genuine, though contained in Struve's old bottles.

The Bitter-Water of Friedrichs Hall

enjoys deservedly a very high reputation amongst Medical Men on the Continent, and in directing the attention of the Medical Profession in this country to the extraordinary virtues of this water, we can mention here only a few of the chief diseases in which it has been prescribed with the most beneficial results—viz., Diseases of the Stomach and Bowels, especially Indigestion, Loss of Appetite, and habitual Constipation; Enlargement and Indurations of the Liver, with or without Jaundice or Dropsy; Diseases of the Kidney, including Albuminuria, Affections of the Sexual Organs, and the numerous accidents which so many women are subject to at their critical age, and the inconveniences resulting from pregnancy; also Hypertrophy of the Heart, Determination of Blood to the Head and Lungs, Hypochondriasis, and Gout, must be mentioned. One peculiar advantage which this water possesses over most other bitter waters is, that it is given only in small quantities—viz., a wineglassful, either before breakfast or on going to bed; that it may be taken at all seasons, and requires neither a particular diet nor exercise in the open air. Further information, with cases, will be found in Dr. Eisenmann's Monograph of this Water, which may be had gratis at Messrs. A. and R. THWAITES and CO.'s, 147, Regent-street, London, and 57, Upper Sackville-street, Dublin, who have just received a fresh supply of this Bitter-water.

NEPENTHE, OR ANODYNE TINCTURE

(OBTAINED EXCLUSIVELY FROM OPIUM),

PREPARED AT THE LABORATORY OF FERRIS, TOWNSEND, LAMOTTE, & BOORNE,
MANUFACTURING CHEMISTS AND WHOLESALE DRUGGISTS, BRISTOL.

This preparation has now been for many years extensively used by a large number of eminent members of the Medical Profession with the greatest success. It does not produce headache, stupor, giddiness, prostration of strength, constipation, or the usual unpleasant symptoms attending the use of other preparations of opium.

Nepenthe has frequently been found of essential service in cases of Cancer, where every other opiate has failed.

The following Testimonials received from Medical gentlemen in extensive practice will be regarded as satisfactory proof of its efficacy:—

MEDICAL TESTIMONIALS.

"Having prescribed your 'Anodyne Tincture' in many cases, I would strongly recommend its more general adoption. It is especially useful in the wakefulness common after parturition, or other unusual exertion or excitement. It produces a refreshing sleep, and I do not remember any case in which it has caused the objectionable effects of the other opiate preparations.

"S. Wellington-street, London-bridge, August 14, 1856.
"SAML. GRIFFITH, M.D. London, M.R.C.P.
Consulting Physician-Accoucheur to the Farringdon Dispensary,
Physician-Accoucheur to St. Thomas's Hospital, &c."

"Gentlemen,—I have great satisfaction in bearing testimony to the value of your 'Nepenthe,' in relieving suffering from disease, and in procuring sleep, where ordinary narcotics fail or disagree. For several months I have found it very effectual in relieving a great sufferer when all the ordinary anodynes had ceased to benefit, and although the dose has not been increased for months, the relief is as complete.

"'Nepenthe' is a very valuable addition to our means of relief, and the Profession and the public are greatly your debtors for it.

"I am, Gentlemen, yours obediently,

"Ipswich, March, 1859.

"EDWD. BECK, M.D. Cantab.

Physician to the East Suffolk Ipswich Hospital."

"To Messrs. Ferris & Co.

"Gentlemen,—'Nepenthe' has, for some time, been a favourite narcotic with me, and I infinitely prefer it to any preparation of opium now extant. It has proved a remedy of great value in all cases of Neuralgia, Chronic Rheumatism, Hypochondriacism, and indeed all affections where the use of a sedative is indicated; and in Delirium Tremens it is certainly invaluable, performing its operation upon the system, without leaving those distressing feelings consequent upon the use of opiates in general.

"I remain, Gentlemen, your obedient Servant,

"WILL. WOOD BRADSHAW, M.D. M.R.C.P. & F.R.C.S. Lond. &c. &c. &c."

Extract of a Letter from the late G. W. CAINES, Esq. M.R.C.S.

"Please to send me some 'Nepenthe,' as I have a patient with cancer in the breast, with whom no other preparation of opium agrees. I have tried them all."

"Uffculme (Devon), Feb. 16, 1854.

NEPENTHE may be procured direct from Messrs. FERRIS and CO., 4 and 5, Union-street, Bristol; from respectable Dispensing Chemists throughout the Kingdom; and from the following Agents:—

LONDON:—Mr. Thos. Keating, 79, St. Paul's-churchyard; Messrs. Evans, Lescher, and Evans, 60, Bartholomew-close; Messrs. Savory and Moore, 143, New Bond-street; Messrs. J. Bell and Co., 338, Oxford-st.
MANCHESTER:—Mr. James Woolley.
LIVERPOOL:—Messrs. Clay and Abraham; Messrs. Evans, Son, and Co.; Messrs. Clay, Dod, and Case.

BIRMINGHAM:—Messrs. Southall Bros. and Co.
YORK:—Messrs. Butterfield, Clarke and Co.
NORWICH:—Messrs. Smith and Sons.
PLYMOUTH:—Messrs. Balkwill and Co.
EXETER:—Mr. Geo. Cooper; Messrs. A. Evans and Co.
EDINBURGH:—Messrs. Raimes and Co.

As many imitations of Nepenthe have been attempted, the signature of FERRIS and COMPANY is placed over the cork of every bottle of the true preparation; and none purchased without this protection can be depended upon.

DR. DE JONGH'S
(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

CAUTION.

Serious and repeated complaints having been made of a discreditable system pursued by many Chemists and Druggists of intrusively recommending or surreptitiously substituting a pale, yellow, or coarse brown preparation, when Dr. de Jongh's Oil is prescribed, the Medical Profession are respectfully and earnestly solicited to afford their assistance in countermacting and repressing a practice alike injurious to their patients and to the fair repute of a remedy now held in such high and general estimation. In all cases where this Oil cannot be procured from a respectable Chemist, application should be made to Dr. de Jongh's Agents,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

By whom any quantity will be immediately forwarded.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. MR. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

No. 1, 2, 3, is J. Alderman's Patent Graduating Elastic Couch, shown in different positions: it is fitted with two, three, or four distinct graduating actions, by which an Invalid can be graduated to any position, without being touched by the nurse, and free from all pressure, so that a patient cannot possibly become bedsores by long confinement.

No. 4, 4, is J. A.'s Improved Spinal or General Invalid Couch and Carriage. The couch can be adjusted to any position, and has a shifting stand on easy castors for the room: so that the patient can be lifted with the couch from the stand to the

No. 8, 8, 8, is J. A.'s Patent Portable Equilibrium Carrying Chair, which enables an Invalid to be carried up and down stairs in the usual way, quite erect, with their arms straight down, which avoids any strains upon their muscles. It is also an easy chair for the room when the handles are off, and free from

No. 7, 7, is J. A.'s Improved Four-wheel Brighton Chair, fitted for hand or pony; the body being mounted upon C and under springs behind, and elliptic springs in front, which make it a most elegant and easy carriage.

No. 10 is J. A.'s Improved Four-wheel Albert Chair, mounted upon C and under springs both back and front, and has his new wrought-iron porches or canes, instead of the old-fashioned wood porches. This is the most elegant and easy carriage in use.

No. 12 is J. A.'s Improved Three-wheel Garden or Bath Chair, fitted with or without a head, and of the cheapest construction.

carriage without being touched, so as to go out for an airing when required.

No. 5, 5, is J. A.'s Patent Graduating, Elastic, Self-adjusting Chair, which, like the couch, is made to follow nature in every respect—the back, the arms, the seat, and leg rest being made to work all together, so that not a muscle of the patient need be disturbed. The arms are made to put on and off, so that the patient can get on and off from either side while the leg-rest is up.

No. 6 is J. A.'s Improved Exercising Horse.

No. 7 is J. A.'s Improved Self-propelling Chair, which renders an Invalid perfectly independent, being able to run from room to room without any assistance.

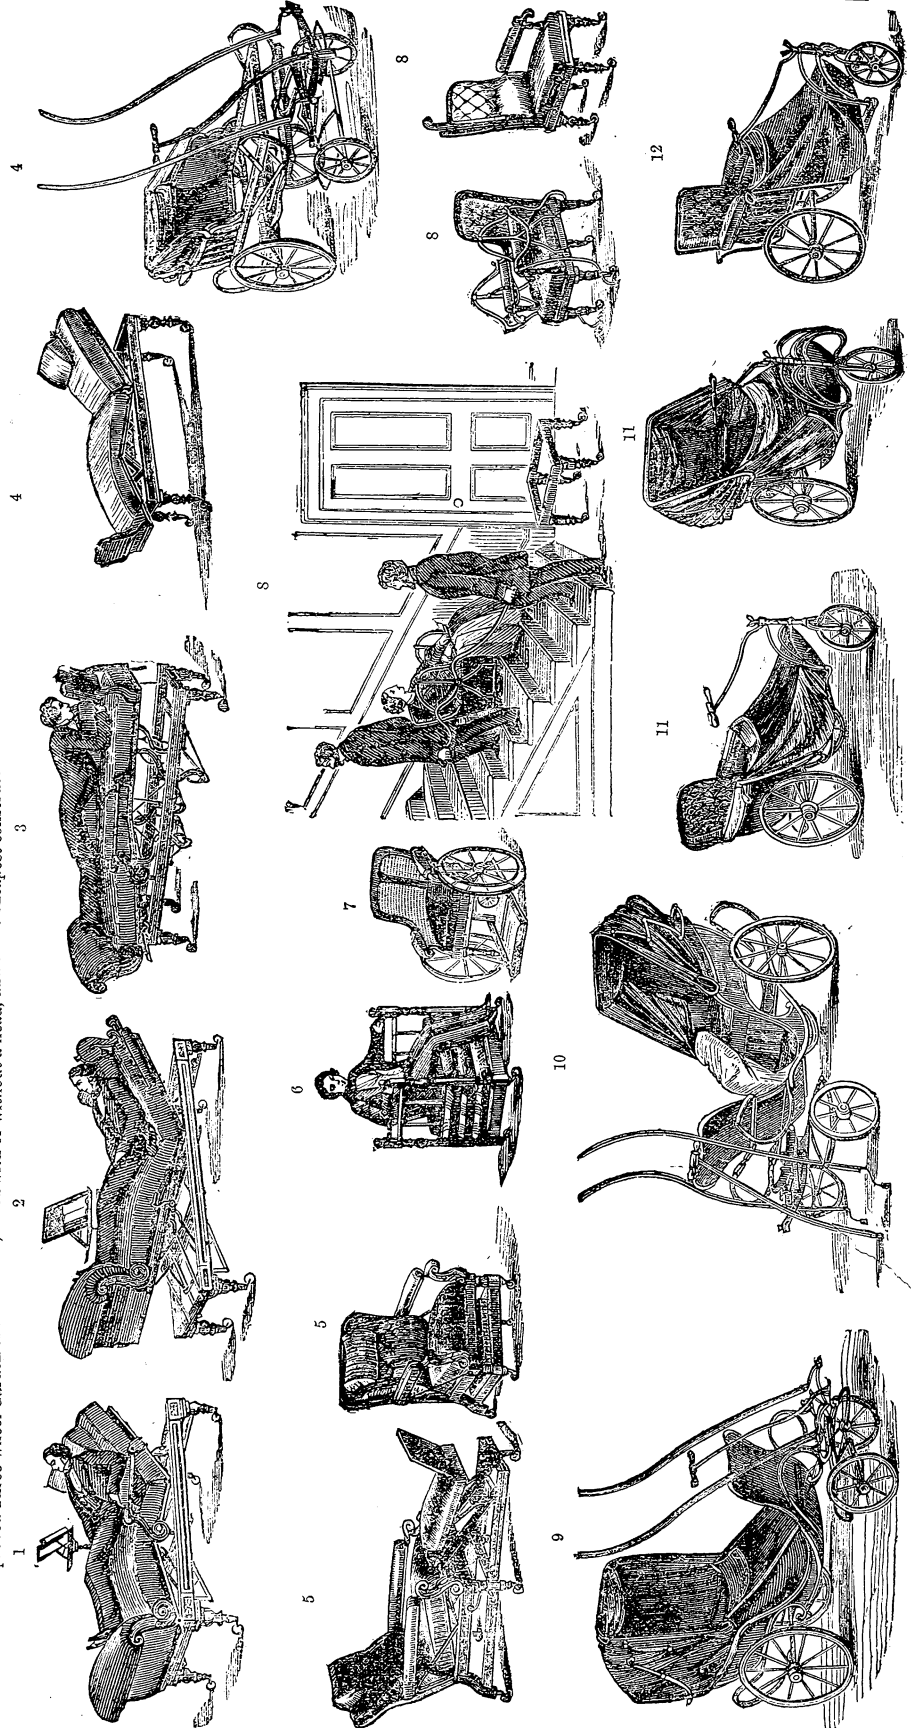

The chair always adjusting itself, enables the two persons who to room without any assistance. It is also an easy chair for the room when the handles are off, and free from

ON

THE DISEASES OF WOMEN.

By J. Y. SIMPSON, M.D. F.R.S.E.

Professor of Medicine and Midwifery in the University of Edinburgh.

LECTURE XX.—*Concluded.*

PERI-UTERINE OR PELVIC HÆMATOMA, AND VARIX OF THE PUDENDAL VEINS.

SYMPTOMS OF THE DISEASE.

You will rarely be called to see a case of pelvic hæmatoma until the extravasation of blood has fairly taken place, and the cellular tissue in some of the loculations of the pelvic fascia has become infiltrated and distended; and then on examining your patient you will find a tumour present, which in all its physical characteristics, and in all the functional disturbances that it produces, resembles very closely the swelling produced by the effusion of serum in the early stages of an attack of inflammation. But there are some marked points of difference. In a patient affected with pelvic cellulitis you would find a high degree of fever, with the pulse rapid and strong, and the skin alternately burning hot and suffused with perspiration. Where the pelvic tumour is formed by effused blood, on the other hand, none of these signs are to be seen, and the general absence of all constitutional irritation and excitement is one of the most striking phenomena of the disease. The patient, if showing any constitutional symptoms at all, is usually depressed instead, and in a state of weakness and prostration. Then if you examine the tumour itself a little more closely you will find there are some distinctive marks there also. An inflammatory tumour is tender to the touch, and pressure with the finger elicits signs of suffering. The first formation of a blood-tumour seems to be often attended with pain, sometimes with great pain, but once it is fully formed, pressure on it with the exploring finger does not cause much uneasiness to the patient. An inflammatory tumour in its earlier stages is very hard and unyielding, and in its later stages, after suppuration has taken place, it can be felt to be fluctuating. A blood tumour is comparatively soft and elastic, but the feeling of fluctuation is never very distinct in the mass of the swelling. There is usually, however, one spot where it is especially soft and yielding; and in the most common form of pelvic hæmatoma, (that, namely, which depends on an effusion of blood into the broad ligament and behind the uterus,) this point is always to be felt somewhat behind and below the cervix uteri, where the finger sinks, as it were, into a kind of hollow. I suppose there is some natural opening or deficiency in the pelvic fascia at this point. In true pelvic hæmatoma, formed by an accumulation of coagulated blood between the layers of the broad ligament and in the neighbouring pelvic cellular tissue, the uterus itself is pushed strongly forward, and occasionally to one side; and sometimes the os or cervix uteri is raised or elevated by the pressure of the blood-tumour. This displacement of the uterus is ascertained on your first examination, or, if the effusion at least is a day old, in cases of pelvic hæmatoma. It is often found also in pelvic cellulitis, but then much later in the disease; or, in other words, not until the inflammatory effusion is at its height; and then generally in pelvic cellulitis the pelvic swelling, as ascertained by repeated vaginal examination, varies in form from time to time, and is much more general around and on all sides of the cervix uteri than in pelvic hæmatoma. Besides, rarely if ever does the pelvic tumour feel fixed to, or springing from, the pelvic bones within, as is so frequently the case in pelvic cellulitis. Then, again, if you can trace back a case of hæmatoma to its commencement, you will find the patient gives you a different history from what she would have done had the tumour in the pelvis been of inflammatory origin. Pelvic cellulitis usually comes on with a high degree of fever, preceded by rigors, and is not necessarily associated with menstruation, while pelvic hæmatoma is almost invariably produced at a catamenial period,

Vol. XL.—No. 1038.—NEW SERIES, No. 477.

often occurs in cases where the menstruation is in some way irregular, and although the patient has sometimes a sort of shivering-fit at first, while the effusion is taking place, she has no fever, but, on the other hand, rather a tendency to fainting. If we could by any chance watch the formation of the tumour, and find it forming rapidly in the space of half an hour or so, there would, of course, be then no doubt as to its nature, for its mere sudden formation would serve as a diagnostic mark; but this is an observation which it will hardly ever be in your power to make, although we may sometimes have occasion to know that the tumour has only had a comparatively short time to grow. There may be pain in both forms of tumour at their commencement; but in the case of hæmatoma, though the pain may be at first even more intense than that usually seen at first in cases of pelvic cellulitis, yet, instead of becoming more and more severe, as is the case with the pain attendant on a progressive inflammatory effusion, it usually becomes less and less acute, as the infiltrated parts become accustomed and accommodated to the morbid pressure of the extravasated blood, so that at last an almost painless swelling alone remains, which you must guard yourself against mistaking for some form of malignant tumour, or some kind of chronic disease. At the close of last autumn, a very delicate patient under my care was one day seized with a sudden faintness and a feeling of great oppression in the region of the heart, the action of which became irregular. She complained at the same time of unusual pain and distension in the uterine region. It was the first day of a catamenial period, and as I happened to know beforehand in what condition the womb was, I traced distinctly the first formation of a pelvic hæmatoma. Fortunately the extravasation did not go on to any great extent, and with perfect rest and the use of the remedies of which I am to speak anon, the effused blood gradually became absorbed, but not till after the lapse of many weeks. The case was interesting further in this respect, that the lady has a great dread of cancer of the womb, and is strongly apprehensive that she will be attacked with that dreadful disease, and not without reason—for her mother had been the subject of carcinoma. Now had I not known previously that the womb in that instance was perfectly healthy, or at least that there was no trace of any carcinomatous affection about it, and had I first made an examination after the extravasation of blood had taken place, and a firm, elastic tumour had been developed around, or rather behind, the neck of the uterus, I might very easily have been led to have adopted the patient's own gloomy apprehensions, and to have come to the conclusion that she was the subject of encephaloid disease. To sum up, then, I may say briefly, that the symptoms of pelvic hæmatoma are the same as those of pelvic cellulitis—with these two characteristic distinctions, that in the case of a patient affected with hæmatoma, 1st, there is an almost total absence of all constitutional fever; and 2nd, the local swelling is found large from the first, and not by any means so tender as in pelvic phlegmon. If, after making a critical investigation into the patient's present symptoms and her past history, and if, after making a careful local examination of the tumour, you still remain in doubt as to the nature of the effusion, you must, if you deem it absolutely necessary, proceed to resolve that doubt by pushing an exploring needle into the mass, when the escape of the characteristic fluid of either form of tumour, will at once reveal the real nature of the case. Always, however, bear in remembrance, further, that you may have both diseases present, and that large pelvic hæmatocœles often excite inflammation, and thus become combined with pelvic cellulitis and suppuration. Now that you have been made aware of the existence of this disease, and now that you know something of its pathology and symptomatology, I trust that when a case presents itself to you in practice, you will have no great difficulty about its diagnosis. Before telling you how it is to be treated, let me say a word or two as to

THE PROGNOSIS OF THE DISEASE.

Many patients recover from this disease spontaneously. This fortunate result especially happens in those cases where the quantity of blood extravasated is small; for then it is capable of being absorbed, just as we see blood absorbed after it has been effused under the skin as a result of injury. But where the amount of hæmorrhage has been greater, we cannot always

be sure of such a fortunate issue. In such a case a variety of changes must first occur in the mass of blood before it can be absorbed, or be eliminated; and frequently inflammation supervenes, and then you may have the size of the tumour increased from the presence of the effused serum. After a time suppuration sets in, and the fluid makes a way for itself to some mucous surface. It may open in this way into the rectum or vagina; but sometimes rupture has occurred into the peritoneum, and lighted up a fatal inflammation there. I have already told you that I saw two patients die in one week from this disease; and there was this peculiarity observed in regard to one of these patients that the pulse became, during the last two days of life lower and lower, as the patient sank and died. This peculiar change in the pulse is the very reverse of what we see in cases of death from pelvic cellulitis.

TREATMENT OF THE DISEASE.

The indications for the treatment of pelvic hæmatoma may be reduced to four.

1. *The Employment of Hæmostatic Measures.*—If you happened to be called to a case sufficiently early, while the extravasation was still going on, and the tumour still in process of formation—a contingency not very likely to occur often—the indication should be to try, if there were any time for it, to check the effusion of blood by the prompt administration of some general hæmostatic remedies, or of some of those medicines which, when taken internally, have the effect of moderating the flow of blood from injured blood-vessels. And at the same time you would do well to apply ice, or cold in some form, locally, with a view of acting more directly on the vessels, and leading to their contraction and closure. But usually there is little time for the adoption of such treatment. In most instances, indeed, there is none; for in the vast majority of cases you are not called to see the patient until some time after the rupture has occurred, and until the blood tumour has been fully formed, and the blood has ceased to flow. Some other indications, therefore, demand your attention, and you will accordingly be obliged usually to have recourse at once to

2. *The Use of Antiphlogistics.*—There is, perhaps, no point of more importance to be attended to in connexion with the treatment of pelvic hæmatoma, than the necessity of putting the patient at once on antiphlogistic diet and regimen, in order to prevent, as far as possible, all chance of inflammation being lighted up in the tissues which are subjected to irritation by the presence of the effused blood. For the supervention of acute and suppurative inflammation in such a case is a most calamitous complication. I have already told you that hæmatoma is in itself sometimes dangerous,—it is almost always tedious: and you may remember that in a former lecture I pointed out that cases of simple pelvic cellulitis were not always free from danger, and were often of long duration. But when the two diseases coexist in the same individual, you can perceive that the immediate risks and dangers of the patient are multiplied, and as there has been a double effusion—a traumatic effusion of blood, and an inflammatory effusion of serum or pus—the time necessary for absorption becomes greatly prolonged, and the period of convalescence indefinitely postponed. Besides, inflammation set up around any large and decomposing mass of blood is always dangerous and perilous, especially as here, in the vicinity of a large serous sac such as the peritoneum. Hence the paramount importance of keeping the patient on a low and antiphlogistic diet, and of making her avoid every form of stimulant. Hence, too, the absolute necessity of keeping her at perfect rest. You may think this a simple matter, and easy to be attended to, but in practice you will find it extremely difficult to enforce complete quiet on your patient. She has often no pain, and no fever, and after the uneasiness and prostration immediately consequent on the extravasation of blood into the cellular tissues have passed off, it is sometimes very difficult to persuade her to keep her bed for ten or twelve days subsequently. One of the fatal cases to which I have already more than once referred, occurred in a patient who, travelled from Rosshire to Edinburgh after she had recovered from the immediate effects of the extravasation. The excitement and irritation caused by the journey led to the occurrence of an inflammation around the seat of the effusion, which speedily proved fatal. You must, therefore, try also to keep the bowels quiet for a time. Insist on the

patient keeping free from all bodily and mental excitement, and maintaining the horizontal posture until the tumour begins to diminish. If it have been of such size as to project above the brim of the pelvis, you will be able to trace and mark out easily the daily diminution of it by external examination; if not, then by feeling it with the finger through the vagina, you will succeed in making the observation. The first and most important indication, therefore, which you are called upon in most cases of pelvic hæmatoma to fulfil, is to avert as far as possible, all chances of any attack of inflammation in the surrounding tissues, or to subdue any inflammation that may chance to have arisen, by the prompt employment of proper antiphlogistic measures. With these means you may perhaps conjoin,

3. *The Administration of Discutient Remedies.*—Most practitioners deem it necessary to prescribe some discutient medicines, which ought, at least in the opinion of the pharmacologists, to have the effect of promoting the dissolution and absorption of the extravasated mass of solidified blood; and if you really can prescribe remedies which are possessed of such an action, it would, of course, be advisable and right to administer them. But I know of no drugs that are very serviceable in this way, and it has yet to be shown that any one has the power of favouring the resorption of effused blood. All that you can usually do is to regulate the diet, by restricting the patient from the use of all stimulants and all indigestible matters, and by curtailing her usual amount of fluids. You may even give some alkaline diuretics, with the view at once of diminishing the quantity of the fluids already in the system, and of ensuring the immediate secretion of the effete matters that are absorbed from the seat of the disease. If you do, however, think it necessary to have recourse to the use of discutient or deobstruent remedies, let me advise you to have them applied locally through the vagina, in the form of medicated pessaries, in preference to administering them internally through the stomach. I have sometimes used pessaries in this way, containing mercury, iodide of lead, etc., but not, so far as I could perceive, with any marked effect. All you have to do, usually, is to make a judicious use of antiphlogistic remedies, to enforce a strictly antiphlogistic regimen, with rest; and to take every precaution to prevent the patient from injuring herself or aggravating the disease. Under this regiminal treatment, the blood, in most cases, will in time become absorbed; and the swelling will gradually disappear. Such, I say, is the most common course of the disease; but in some cases its course is changed, and a corresponding change of treatment is required at the hands of the practitioner. Sometimes inflammation sets in, in despite of your most skilful and careful treatment; or it may have begun before the case came into your hands; or the patient may have an aggravation of all her sufferings from a renewed extravasation of blood. Now, where a pelvic hæmatoma begins to enlarge, and to become painful, I believe you give your patient the best chance of recovery by having recourse to

4. *The Opening of the Tumour.*—When a hæmatoma is running its course gradually and quietly, causing no great amount of pain, and giving rise to no particular degree of distress, your patient's best chance of recovery lies in her keeping at perfect rest, and in your totally and resolutely withholding your hand from all kinds of Surgical interference. But if betimes the tumour begins to swell up and enlarge in consequence of inflammation being lighted up in the involved and surrounding tissues, you will find that the effused matters try to gain an exit for themselves through some mucous or other surface, as the rectum, vagina, or into the peritoneum, and you must take the hint from nature and make an artificial opening into the fluid collection at the point most favourable for its free and full evacuation. As in the case of purulent collections commencing in the broad ligament, so in the case of hæmatoma when the hæmatoma becomes inflamed and softened, the most dependent point is usually to be found immediately behind the os uteri in the posterior cul-de-sac of the roof of the vagina; and a good, free incision made into the mass at this spot you will generally find to be followed by the best results. I have now repeatedly had recourse to that measure, and with the greatest benefit. In making the evacuation, do not try to draw off the fluid with a trocar and canula, as I improperly did in the Hospital case the account of which I read to you, because there are always masses of blood-clots mixed up with it which are too large to

escape through the canula, but which it is of the utmost importance to have removed. They act the part of a foreign body in the cavity, like the necrotic tissues to which I directed your attention when speaking of fetid abscesses; and so long as they remain there you can entertain no reasonable hope of a cure. To open the hæmatoma effectually, you must make an incision into it with a tenotomy-knife, and then freely dilate the opening still further with the finger. By enlarging the orifice in this way, you run less risk of causing a dangerous degree of hæmorrhage than when you at once make with the knife an incision of sufficient size to admit of the escape of the solid masses. For it is not enough in a case of this kind to make an opening into the cyst. You must introduce the finger through it and break down the septa and blood-coagula, so as to ensure their complete removal; and it is only when all the contents of the cavity have been in this way well cleared out that you ensure the best chance of its contraction and closure. This operation may even be performed with safety and success in cases that look most unpromising; in cases, for example, where the patient has become pale, and of an exsanguine appearance, in consequence of the effusion of a great quantity of blood into the cellular tissue of the pelvis. Two or three years ago I saw a patient along with Dr. Cruikshank, when she was at the time the subject of an enormous pelvic hæmatoma. She was then extremely pallid and weak; and the hæmatoma had become tender and inflamed and was threatening to enlarge and burst. I made a free opening into it, and cleared out the contents of the cavity, which gradually contracted and healed up. She left Edinburgh before she had altogether regained her strength, and when she came to call on me lately, I did not at first recognise her, so very different did she look from the exhausted chlorotic-like patient whom I had previously seen. I repeat, then, what you have to do in most cases of hæmatoma, is simply to watch carefully the progress of the case, and protect the patient from every form of injury; to keep down as far as possible all chances and tendencies to inflammation in the part; and if symptoms of inflammation and inflammatory effusion and swelling do come at last to manifest themselves, to make a free and early incision into the cavity, so as to evacuate the whole of its contents. The artificial evacuation of the collected blood may perhaps also be occasionally judged advisable in some cases, where no inflammation has supervened, but where the tumour continues large and presses injuriously and painfully upon the surrounding parts and organs. But such instances are rare.

HÆMATOMA OR THROMBUS OF THE VULVA.

But hæmatomata are not confined to the portions of cellular tissue lying between the layers and prolongations of the upper division of the pelvic fascia. They sometimes occur lower down in some part of the wall of the vagina, most frequently towards the outlet of the canal. Here they may occur as a result of direct injury; oftener still they are produced during labour. The veins at this point are large and numerous, and during the course of pregnancy they become somewhat dilated from the pressure of the enlarging uterus, or the veins above; so that when labour supervenes, and they become themselves subjected to the direct pressure of the foetal head from above, one of them sometimes bursts, and gives rise to a swelling in the maternal passages, which may impede and seriously complicate the progress of the labour. Blood-tumours forming in this way in the labia pudendi, or in the walls at the lower end of the vagina during the parturient process, do not necessarily call for any immediate treatment. If of no great size they may be left to themselves, and after a time they usually become absorbed; but sometimes inflammation supervenes in them, and then you will require to open them. Where, on the other hand, the size of the swelling is such as to interfere with labour by forming an obstacle to the passage of the foetal head, the case becomes more critical, and the treatment, if the mechanical obstruction ever prevents the exit of the head, may require to be more heroic. In such a complication you may require to make an incision to allow the fluid to escape, and the swelling being thus reduced in size, the birth of the child is facilitated. But where it becomes necessary for you in this way to open the tumour, I would beg to impress upon your minds the propriety of postponing the operation if possible till such time as the effused blood has become coagulated, and till the blood

has ceased to flow from the injured vessel. If you can't wait so long—if the extravasation is still taking place, but prolongation of the labour threatens to be injurious to the life of the mother or the child, what are you to do? Then you must still evacuate the thrombus; but, in addition, you must be prepared to apply pressure to the bleeding surface, remembering that the blood is escaping from a ruptured vein, and that venous hæmorrhage is always most effectually arrested by means of pressure.

VARIX OF THE PUDENDAL VEINS.

As I am speaking of these veins of the pudenda and lower part of the vagina, let me make one or two further observations regarding another morbid condition to which they are sometimes liable. Like the veins of the inferior extremity, when the flow of blood in them is impeded during a lengthened period they may become enlarged and varicose, and then they assume the prominent and tortuous appearance seen in this drawing, (see Fig. 2). This state of the veins is sometimes produced gradually during the course of pregnancy, so

FIG. 2.

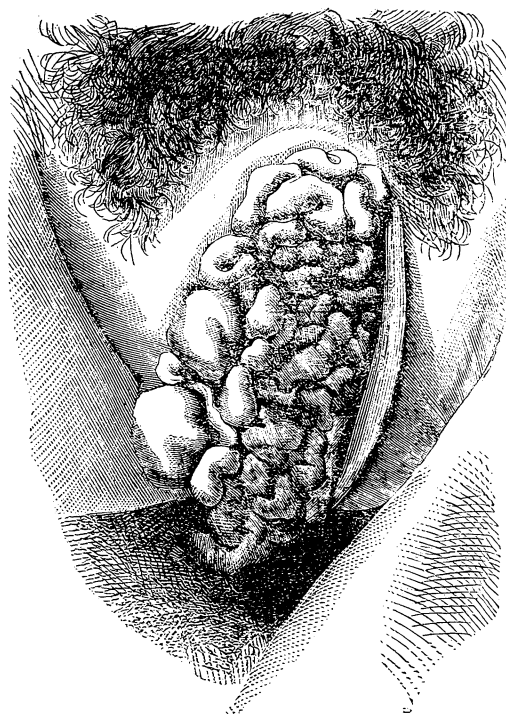

FIG. 2.—Sketch of varicose veins of the nymphæ. (Brasse.)

that during labour they became turgid and prominent, leading to the idea that it will be necessary to have recourse to some extreme measure to obviate the chances of their being ruptured. But in truth they rarely, if ever, require to be interfered with during labour. I have repeatedly seen and been consulted about pregnant and parturient women in whom this condition of the veins was present, but I never saw a case where by their own bulk they caused any such impediment or annoyance as required any special treatment during labour.

But like varicose veins in other parts of the body, these varicose veins of the vulva are apt to become inflamed, and their walls may in consequence become indurated and inelastic, for then the diseased and stiffened vein bleeds as profusely as an artery. Should they, when in such a condition, be subjected to any kind of injury, a dangerous and even fatal hæmorrhage may readily result. In the Scotch law-courts during the last five-and-twenty years a considerable number of trials have taken place in consequence of women bleeding to death after sustaining some injury of the pudenda. In most of these cases all that was alleged as to the cause of death was, that the woman had received a kick on the part at a time when she was pregnant, and that a slight laceration had been

produced, from which the fatal hæmorrhage took place. In such cases the veins are sometimes in the condition I speak of; and we have found experimentally that a blow on the part is sufficient to cut through these vessels by bringing them suddenly and forcibly in contact with the ramus of the ischium and pubis. In these cases death was so far accidental and unintentional. But in others a knife has been used, and an incision made into the veins, in order to mislead to the belief that the patient had died of puerperal hæmorrhage. Sometimes the injury has been purely accidental, from the patient falling and hurting herself, on some broken crockery for example. In other instances, again, the hæmorrhage has occurred spontaneously. A case of this kind happened at Dundee some years ago, where a patient died of hæmorrhage occurring from a ruptured vein of the pudendi, and where she had been subjected to no kind of injury whatever. She was passing water when the blood began to flow, and she at once called the attention of those near her to the circumstance. Medical aid was immediately sent for, but before the doctor arrived the patient had bled to death. When the late Dr. Martin Barry was acting as House-Surgeon in the Lying-in Hospital here, a case occurred where rupture of the pudendal veins was produced during the act of coition, and nearly ended fatally; and in one of the English journals a few years ago there was an account of a trial at Bristol, where a butcher was accused of killing a married woman, who died from rupture of these veins, produced under similar circumstances. I have taken this opportunity of speaking to you of these cases, in order that you may be aware of the occasional fatality of lesions of the pudendal veins, and in order that you may be made alive to the importance of at once obeying the call, should you ever happen to be summoned to aid a woman who had been subjected to such an injury. Here again, as in venesection and other forms of venous hæmorrhage, pressure is generally adequate to arrest the discharge, but it may require to be kept up both strongly and steadily.

ORIGINAL COMMUNICATIONS.

CASES OF DIPHTHERIA,

WITH REMARKS ON

THE PATHOLOGY, SYMPTOMS, AND TREATMENT OF THE DISEASE.

By J. S. BRISTOWE, M.D. F.R.C.P.

THE disease termed Diphtheria, notwithstanding that it has prevailed so extensively, and now for so long a period, is still regarded with such interest, that any observations with regard to it, even though they be merely confirmatory of previous statements, will doubtless be acceptable to the Profession. I purpose, therefore, in the present communication to record my own experience of the disease, and to express the views I entertain with regard to its pathology, symptoms, and treatment.

The four following cases all originated within the walls of St. Thomas's Hospital; the first two recently, in a surgical ward in which erysipelas had prevailed about a couple of months before, and in which there had been a mild case of scarlet fever six weeks previously; the last two some years since, but at a distant interval and in different wards.

Case 1.—T. N., a boy 10 years of age, had been under Mr. Solly's treatment in St. Thomas's Hospital since November 12, 1858, for contraction of the arm after a burn. He had gone on favourably until the 21st March, on the morning of which day he is said to have had a slight attack of shivering.

On the 22nd (if not before) he complained of sore throat; had a purgative administered, a mustard poultice applied to the throat, was put on milk diet; and in the evening began to take chlorate of potash with decoction of cinchona, and to use a gargle of chlorinated soda.

On the 24th it was noted by the Registrar, that the throat was much swollen externally, particularly on the right side; that the right tonsil was much enlarged and covered by a pulaceous material; that the pulse was small, weak, 130; that the tongue was furred, and the skin cool.

On the 25th, at 1 p.m., he was placed under my care. His

bowels had been relieved, he had passed a fair night, and was said to be a little better than he had been. He was extremely feeble, however, but not at all feverish, and perfectly rational. The skin was cool, and without rash. Pulse small, weak, slightly irregular, about 100. There was great tumefaction, hardness and tenderness in the upper half of the throat; but chiefly in the parotid and sub-maxillary regions, and more on the right side than on the left. The anterior half of the tongue was clean, and its papillæ were healthy; its posterior half was somewhat furred. The right tonsil was much swelled and covered by a thick wash-leather-like false membrane, which was prolonged over the pillars of the fauces, and the right half of the soft palate. The nose had bled in the morning and a little thin sanious fluid continued to ooze from it. He had no pain anywhere except in the throat. Had pain and difficulty in swallowing, but could take fluids. There was no cough or impediment to respiration.

To continue the gargle, but to omit the mixture. To have a bran poultice to the throat; to take soda-water; and to have, in addition to milk diet, a pint of strong beef-tea, two eggs, and four glasses of wine.

He slept well the following night; but when seen the next day (the 26th) at 2 p.m., was evidently dying. His skin was cold, his pulse imperceptible, his tongue dryish yet little furred, and his breath of a distinctly gangrenous odour. He was perfectly sensible, but very restless. He had no embarrassment of breathing, but much pain in swallowing, and tenderness in the throat; which had become more swelled externally, and studded on the right side with hæmorrhagic spots, but presented internally the same characters as before. In other respects there was no change. Ordered three glasses of brandy.

He died at 5.30, remaining sensible to the last.

The urine unfortunately was not examined, owing partly to his passing extremely little, and partly to the negligence of the nurse. No rash was ever detected, and the tongue never exhibited the scarlatinal character. It is not known whether he had ever suffered from scarlet fever.

Autopsy.—The whole of the muscular and cellular tissues of the neck, from the jaw above to the superior thoracic orifice below, and from the integuments to the vertebrae, were tumid, indurated, and so infiltrated with blood as to be almost black. The soft palate was half-an-inch thick, infiltrated with blood, and studded with shreds of false membrane. The tonsils were much swelled and deeply congested; the left contained numerous small suppurating cavities, the right was gangrenous; and both were covered pretty completely by tough, greyish-yellow adherent false membrane. The mucous membrane of the base of the tongue, of the back of the pharynx, and of the posterior nares, and that covering the epiglottis and upper half of the larynx, were thickened, infiltrated with sanious fluid, and covered by patches of fibrinous exudation. The false membrane was made up chiefly of fibrillated lymph, the fibrils being irregular in form, but generally comparatively thick, and assuming a reticulate arrangement. The superficial portions presented large numbers of more or less perfect epithelial cells, together with granular matter. No vegetable parasitic growths were recognised. The trachea and œsophagus were in a normal condition.

Chest.—The pericardium was healthy. The heart was small, firmly contracted, and nearly empty; its auricles and right ventricle containing a little fibrinous clot only. The muscular tissue of the organ was generally pale, but presented numerous and extensive tracts infiltrated with extravasated blood; and under the microscope was distinctly fatty. Pleuræ healthy. The lungs were crepitant and little congested. The superficial portions, however, presented a few dark red, almost black, patches of solid granular lung tissue. The bronchial tubes contained much mucus.

Abdomen.—Peritoneum, stomach, and intestines healthy. The cellular tissue of the mesentery presented numerous patches of extravasated blood. The liver was perfectly healthy, but its surface was studded with minute petechial spots. Spleen pale and healthy, not soft. The pancreas was healthy, but there were extravasations of blood into the cellular tissue around it. There was distinct hæmorrhage both into and around the supra-renal capsules. The kidneys were of usual size, pale, and apparently quite healthy. But under the microscope the epithelial lining of the tubes was found to be thickly studded with molecules of oil, and often

confused in its arrangement; some of the tubules contained extravasated blood, others transparent fibrinous casts; and a few of the malpighian bodies presented accumulations of granular exudation matter.

Case 2.—W. A., a boy, aged 8 years, had been in the same ward as the last since March 1, having large tonsils and a cleft palate; which latter it was intended to remedy by operation.

On March 27th (the day after the death of the former case) he complained of slight sore-throat.

On the morning of the 28th it was rather worse. There was some swelling and tenderness below the angles of the jaw; and the tonsils, which were enlarged, and the back of the pharynx, presented small patches of false membrane. Skin cool, perspiring; no rash. Face a little flushed. Tongue slightly furred. Bowels open; appetite not good; little thirst; but no headache, pains in limbs, or rigors.

Milk diet. ζ vj. wine. Soda-water. Bran poultice to the throat. To take a simple febrifuge mixture. To use his milk, warm, as a gargle.

In the evening he was transferred to a Medical ward, and placed wholly under my care. Two eggs daily were ordered, and ζ j. wine every two hours, night and day.

March 29th.—Slept comfortably; about the same as yesterday in his general symptoms. Skin warm; tongue clean; slight thirst. Considerable pain in swallowing. Submaxillary regions swelled and tender. The false membrane covers both tonsils, and the adjacent portions of the split soft palate, and has become more abundant on the back of the pharynx; it is thicker and whiter than before. He was ordered in the evening to take ζ j. port wine every hour night and day; together with four eggs and milk, to be administered in small quantities, but frequently.

30th.—Much the same to-day; the membrane has not spread; the pulse is less frequent. The bowels which had not been relieved for two days were opened by a castor-oil injection. Ordered a pint of strong beef-tea daily.

31st.—Slept fairly, feels better. Submaxillary region less swelled and tender. Can swallow more comfortably; the membrane has spread no further, and seems separating. Tongue clean.

April 1.—Slept well; is evidently improving. No submaxillary pain when quiet, but still has pain in swallowing. Skin warm. Tonsils less swelled, membrane coming away. The tongue, however, is foul, and the wine has been making him sick. Ordered to take sherry instead of port, and during the coming night every two hours instead of every hour.

2nd.—Still improving; slept well. Has recovered from his nausea, and has this morning recommenced taking his wine every hour.

3rd.—Still progressing favourably. A little fulness, but no tenderness, below angles of jaws; a little uneasiness only in swallowing. Tonsils subsiding; membrane coming away in fragments.

To take a grain of quinine thrice daily; and to use a gargle containing chlorate of potash.

He continued to improve in all respects during the next day or two, taking all his wine, eggs, strong beef-tea, and milk; but becoming somewhat tired of the wine. His bowels, however, required opening by means of medicine. By the 6th his tonsils were nearly clean; his uvulae, which had become exposed, were slightly excoriated; and his relish for food was returning. His wine was reduced to ζ xvj. On the 7th he began to take rice-pudding. By the 8th the throat had become perfectly natural in appearance; and his appetite was assuming its healthy proportions. The wine was reduced to ζ xij., the eggs to two, the beef-tea was countermanded, and he was put on mixed diet. Still gradually recovering health and strength, the wine was reduced to ζ viii. on the 10th, and on the 12th to ζ iv.; and on the 15th he was retransferred to a Surgical ward perfectly restored.

I may here add that the boy never manifested any distinct febrile symptoms, rarely any headache, and that he usually slept comfortably. His tongue was generally clean, and its papillae were never enlarged. The skin was sometimes hot, but never dry; never presented any rash, or tendency to peel. The pulse varied at first from 130 to 112 in the minute, sunk to 108 immediately after the wine was raised to ζ xxiv., and then gradually subsided to its normal frequency. During the earlier period of the disease the urine furnished abundant lithates; and on the 7th day first contained a little albumen,

which continued for about five days and then disappeared. The false membrane came away gradually in fragments, was several times examined microscopically, and found to present the usual appearances. It is stated that he had never had scarlatina.

Case 3.—M. A. F., a single woman, aged 22, was admitted at the beginning of February, 1853, for some pulmonary complaint, from which she soon became convalescent. No notes of the case are preserved; but it is clear, from the treatment recorded on the bed ticket, that on the 12th of March she began to suffer from inflammation of the throat, and that it continued increasing in severity up to the time of her death, on the 24th.

Autopsy.—The mucous membrane of the pharynx, fauces, and base of the tongue was covered by a layer of tough, dirty greyish lymph between a half and a quarter line thick. Its free aspect was irregular, fissured, and in places flocculent. It adhered pretty firmly to the subjacent mucous surface, which was congested, and here and there excoriated. It ceased gradually at the lower part of the pharynx; and the oesophagus was healthy. Both surfaces of the epiglottis, and the rest of the mucous membrane of the larynx, were similarly enveloped in a layer of adherent lymph, which was prolonged into and filled the sacculi laryngis. The mucous membrane was congested and much thickened. There were a few patches of lymph in the trachea. The membrane presented under the microscope a fibrillated structure, mixed with epithelium and nuclear bodies. Pleurae healthy. Lungs of moderate size, but firmer and heavier than natural. They were congested, and, on close examination, presented a peculiar mottled aspect, owing to numerous patches of a dark colour being scattered uniformly and thickly throughout the substance of the organs, but separated from one another by a network of lighter and more healthy-looking tissue. The solid patches were small (about the size of one or two lobules each), airless, granular, and in some instances as black as pulmonary clots. They were observed microscopically to consist of air-cells, filled with a coherent mass of nuclei, having a close but not perfect resemblance to pus. The bronchial tubes contained much frothy fluid. The pericardium and heart were healthy.

Case 4.—J. P., a man 35 years of age, was admitted into a Surgical ward on the 29th June, 1852, for psoas abscess, and was treated with good diet, stimulants, and morphia. He seems to have gone on without any complication until Oct. 13, when, probably for croupy or laryngeal symptoms, he was ordered ζ ij. of antimonial wine every four hours. On the 15th a blister was applied to the throat, and on the same day he died.

Autopsy.—Much emaciated; several small openings were seated in the right groin. The tonsils were healthy, but the surface of the pharynx behind them was covered by a thick, loosely-adherent, white, softish material. This extended in large quantities half-way down the oesophagus, and in the form of aphthous patches studded the remainder of the tube. The mucous membrane of the pharynx and upper half of the oesophagus was much ulcerated; that of the lower half of the oesophagus congested, and in places excoriated. The upper half of the larynx was loaded with a similar deposit, and its mucous membrane was cedematous and ulcerated. The lower half of the larynx and the trachea were healthy; the lungs a little congested only. The deposit was made up microscopically of epithelium and fibrillated material. A large psoas abscess was found, unconnected with bone, but no further visceral disease.

(To be continued.)

CASE OF CHRONIC INVERSION OF THE WOMB REDUCED BY TAXIS.

By T. PRIDGIN TEALE, Jun., M.A. Oxford, F.R.C.S.

HAVING read in the 41st volume of the *Medico-Chirurgical Transactions* a case recorded by Dr. Tyler Smith, in which a complete inversion of the womb, of twelve years' standing, was reduced by manipulation, I was led to adopt a similar mode of treatment in the following case.

Mrs. H., of Leeds, aged 42, mother of five children, was suffering from profuse hemorrhage at her menstrual periods.

The flooding lasted usually for a week, and often for a fortnight. During the intervals between these periods she seldom passed a day without some loss of blood. Of late the hemorrhages were becoming greater and more prolonged. She was pale, but not wasted. Her health and strength were, however, seriously impaired.

On seeing her in February last, during a period of profuse menstruation, I ordered the decoction of ergot, which lessened, but did not suspend the hemorrhage. Ten days later, when menstruation had fairly ceased, there was found on examination an elongated tumour protruding from the mouth of the womb. It was rounded at its lower extremity, a little flattened from before backwards, and narrower at its upper part, which was embraced by the mouth and a narrow band of the neck of the womb. The upper part of the tumour was separated from the neck of the womb by a shallow groove, along which the continuity of the constricting uterine tissue with the tumour protruding through it could be traced all round. She gave the following history of her ailments.

In September, 1856, she was delivered of her fifth child. The labour was natural, but the placenta had to be removed by her medical attendant. Shortly after the completion of labour, severe hemorrhage set in, and recurred at intervals for several days. On the third day after her delivery, Mr. Morley, of Leeds, was consulted. This gentleman found the womb inverted, and much swollen. He made several attempts on that, and on some succeeding days, to reduce it, but found the womb so hard and unyielding to pressure, that replacement was quite impracticable. By the aid of astringents and recumbency, the tendency to flooding abated, so that at the end of six weeks the patient was able to resume her usual duties. From this time she was free from flooding until the return of menstruation in the fifth month after her delivery. Her condition has since progressively become worse.

From the history of this case, and the conditions found on examination, there appeared to be no doubt that the tumour was the inverted womb. I therefore decided upon adopting the plan of treatment practised by Dr. Tyler Smith.

Having waited until the end of the next menstrual period, I desired her to remain in bed two days, and then began the special treatment on March 16.

March 16, 1859.—The neck of the womb at this early period after menstruation was found to be much more relaxed than at my former examination, so much so that the continuity of the tumour with the neck of the womb could be easily traced all round by the finger. The patient being laid on her left side, and placed under the influence of chloroform, I introduced the left hand into the vagina, and commenced steady compression of the tumour, covering with the fingers as much of its surface as possible, and at the same time pressing the whole mass upwards in the axis of the brim of the pelvis. The pressure was steadily and firmly maintained for ten minutes, when the tumour had so far yielded as to allow two-thirds of its substance to be reduced within the level of the mouth of the womb. An air-pessary was then introduced into the vagina, and distended.

17th; second day.—Chloroform was again administered. On removing the pessary, the mouth of the womb was found to be much more dilated and relaxed than the day before, and the tumour could readily, and with very moderate pressure, be reduced to the extent of three-fourths of its bulk. After using firm pressure for about ten minutes the whole tumour was reduced within the mouth of the womb, although it was still inverted within itself. The pessary was again introduced and inflated. In the evening she complained of severe, but intermittent abdominal pains. The pessary was therefore allowed to collapse, and the pains ceased.

18th; third day.—The pessary having been inflated six hours previously, the patient was again put under the influence of chloroform. The tumour was now much reduced in size, and could be easily pushed within the mouth of the womb. Compression by the hand was kept up for ten minutes, during which the tumour had so far receded that the compressing fingers were received within the cavity of the womb up to their second joint, and the tumour itself was much dimpled and softened. Replacement having advanced so far, it was thought desirable to continue the pressure, and in four

minutes more the inverted womb was gradually and completely reduced.

As a precautionary measure she was desired to remain in bed during the following week. No unfavourable symptoms occurred, and she gradually resumed her domestic occupations.

July 19.—Since the replacement of the womb, she has menstruated three times at full monthly periods, being unwell for three, and not more than four days, each time, and perfectly free from flooding. She is, now in good health and strength, and rarely suffers from leucorrhœa, which formerly was never absent.

In concluding the report of this case I would especially direct attention to the importance of the following points:—1. The period at which the treatment was commenced, namely, soon after the cessation of menstruation, when the parts are in a more relaxed condition. 2. That the patient should be recumbent during, and for a day or two previous to the commencement of, the treatment. 3. The use of forcible pressure by the hand at intervals, while the patient is under the influence of chloroform. 4. The use of a more gentle but continuous pressure by the inflated pessary.

THE LONDON

PRACTICE OF MEDICINE AND SURGERY.

GUY'S HOSPITAL.

DISEASE OF THE SHOULDER-JOINT.—RESECTION OF THE HEAD OF THE HUMERUS.—RECOVERY.

(Under the care of Mr. BRYANT.)

THE shoulder-joint, as is well known, is one of those least frequently affected by inflammatory diseases. The instances consequently in which resection of the head of the humerus is required are very rarely met with. That operation, when required, has we believe, as a rule, been very successful. Whether it be that the same vital endowments which protect it from the invasions of disease also enable it rapidly to originate healing processes after injury, it is difficult to say; but the fact is, we believe, beyond doubt that this joint is found from experience to be one of the best adapted for the practice of resections. A case in which Mr. Birkett operated in Guy's Hospital four or five years ago, did very well, as also a second of Mr. Erichsen's in University College about the same time, also one of Mr. Bickersteth's in the Liverpool Infirmary. In an interesting case in which Mr. Hutchinson about three years ago excised the head and upper fifth of the shaft of the humerus on account of a large myeloid tumour developed within the bone, notwithstanding the length of the shaft removed, a good recovery, with firm ligamentous union, followed. In this instance, however, death from recurrence of cancer in the lungs, bone, etc., occurred before the usefulness of the arm had been put to much trial. The following case has just come under our notice in Guy's Hospital:—

A healthy man, aged 24, was admitted about six weeks ago on account of disorganising disease of the shoulder-joint. He stated that the affection had commenced as an aching in the part about twelve months previously. For this he was for some time under treatment in St. George's Hospital. After leaving that Hospital an abscess formed and opened externally, and from this a sinus still remained, which opened in front just anterior to the inner edge of the deltoid. There was great thickening of the parts about the joint, and movement was very limited. No grating could be produced by any degree of motion which the man could bear. Excision having been determined upon in consultation, Mr. Bryant performed that operation about a fortnight subsequent to the man's admission.

When, under the influence of chloroform, the arm could be freely moved, grating was easily produced, and the last shade of doubt as to the entire disorganisation of the joint was thus removed. Mr. Bryant made only a single long incision down the upper aspect of the joint, and through the belly of the deltoid in a direction parallel with its fibres. This was found sufficient to allow of the exarticulation of the extremity of the bone, although the thickening of the adjacent parts rendered this manœuvre much more difficult than it is in the

dead subject. The articular head having been fairly thrown out into the wound, it was sawn off from behind forwards with a Butcher's saw. Excepting a few loose shreds and some small patches still adherent, the cartilage had been wholly removed. The head of the humerus, on section, was seen to be in a state of acute inflammation. Much new bone had been found in the periosteum of the upper part of the shaft. No vessel required ligature after the completion of the operation—a somewhat remarkable circumstance, if we remember the size of the posterior circumflex. On the parts being adjusted after the operation the advantage of the single straight incision was very apparent, since the edges of the wound now came into close apposition spontaneously, and the parts involved were deeply buried. No bad symptoms followed: indeed the external wound healed almost too soon, and on the third day Mr. Bryant opened its edges a little, in order to prevent the risk of any accumulation of matter. On the eighth day the man was up, and about in the ward; on the fourteenth he was allowed to go out in the open air.

TWO CASES ILLUSTRATING THE BENEFITS OF ANTIPHLOGISTIC TREATMENT AFTER SEVERE INJURIES TO THE LUNGS.

(Under the care of Mr. HILTON and Mr. BRYANT.)

In the present period of prevailing scepticism as to the influence of many modes of treatment which held undisputed sway among the older Surgeons, it is well every now and then to draw attention to unequivocal instances of prompt benefit obtained by decided measures. More especially is it so when these measures, instead of being novel, are of old-established, but now somewhat waning, character.

Many of our readers may probably have noticed in the newspapers the account of a little boy who had been knocked down by one omnibus, and run over by another, and had received most severe injuries. The accident occurred in Shore-ditch, and the poor little fellow was taken to Guy's Hospital, where his state appeared so hopeless, that what was believed to be his dying deposition was taken, to be produced in evidence against the drivers of the vehicles. When admitted his ribs were found to be fractured in the most frightful manner. His chest had been, as it were, pounded, and it was difficult to say which of the ribs had not been broken. He was in collapse, and there was much emphysema of the subcutaneous cellular tissue. Of course no stethoscopic examination could be thought of. He remained very low indeed for some time, in spite of the cautious use of stimulants, and it was at the end of twenty-four hours that his evidence was taken under the circumstances above mentioned. He had expectorated a good deal of blood, but his respiration remained throughout much embarrassed. As this embarrassment of breathing was, however, accompanied by a cold skin and failing pulse, it was not thought justifiable to abstract blood. As soon, however, as there were signs of rallying, tartarised antimony in full doses was ordered. The effect of this remedy in quieting the breathing was most marked, and the boy's progress has been from that time steady and good. He is now considered out of danger.

The above case impressed all who saw it with a strong conviction that great benefit had resulted from the free use of the antimonial remedy, but the following offers evidence which will be still more convincing to the reader. It also illustrates a yet more decided adoption of antiphlogistic measures:—

A young man, aged 19, was brought into the Hospital, having been run over by a cart, and having suffered an extensive fracture of the ribs on the left side. The five upper ribs were believed to be broken, and the lung was evidently wounded. There had been rather profuse hæmoptysis. The chest was ascertained to be resonant in all parts, but his state was such as altogether to preclude any detailed examination. The lungs appeared to be loaded with fluid, but the pleura did not, as far as could be made out, contain either air or blood. The chest was put up with strapping, as is usual at this Hospital. Within the twelve hours following the accident the man's difficulty of breathing greatly increased, and he seemed indeed to be rapidly sinking. Still, however, the pulse had rallied, and he was not in collapse, but dying rather from pulmonary embarrassment. Under these circumstances Mr. Bryant determined to bleed him.

Antimony in large doses had already been commenced. The first bleeding was at one o'clock at midnight, and was to the extent of ten ounces. It was followed by much relief, but by degrees subsequently the difficulty in breathing returned. About noon the same day a second bleeding to the extent of fourteen ounces was practised, and with, again, the most marked benefit. Within twenty-four hours of this second bleeding the man might indeed be considered well. He could sit up in bed and talked cheerfully. The antimony had, of course, been kept up. At present the man is fast becoming convalescent, having experienced no drawback whatever.

ST. GEORGE'S HOSPITAL.

DEATH AFTER PARACENTESIS FOR OVARIAN DROPSY.

(Under the care of Dr. PITMAN.)

We have recently cited several cases in proof that paracentesis for ovarian dropsy is not a measure so devoid of risk as has been imagined. In the following, in which death occurred within a few hours of a first tapping, it will be seen that the patient was in a very feeble state, and also the subject of phthisis prior to its performance. We are indebted to Mr. Vining, House-Surgeon to St. George's, for the notes of the case.

A. W., aged 32, was admitted July 20, and died July 24, 11 p.m., under the care of Dr. Pitman. This woman was the mother of four children; she had been out of health for the last five years, losing flesh, suffering from cough and general weakness. The father, brother, and sister died of consumption. She had noticed an enlargement of the abdomen for more than a year. On admission, the abdomen was found to be much distended with fluid; the heart's sounds were normal; the urine not albuminous. She was ordered ammon. sesq., compound spirits of ether, and laudanum three times a day, and some castor-oil. The next day she was very low, (pulse 120, and she complained of pain in the chest and palpitation. She continued much in the same state, getting very little sleep, when, on the 24th, the distension of the abdomen from accumulation of fluid being very great, paracentesis was performed, forty-eight pints of thick yellow fluid being drawn off. She gradually sank, and died about midnight of the same day.

Morbid Appearance.—General appearance: The body was flaccid from the recent withdrawal of dropsical fluid. The puncture by which the fluid had been withdrawn remained open in the median line, about an inch and a-half below the umbilicus. *Thorax:*—The heart was healthy; the right side full of gelatinous clot. There were adhesions at each apex, stronger on the right side. A few miliary tubercles were found at the apex of left lung. At the apex of the right was a large vomica, and the substance of the lung was much consolidated around it. *Abdomen:*—The liver was large, weighing 4 lb. 9 oz.; it was healthy in structure. The kidneys were large and congested. The greater part of the abdominal cavity was occupied by a large ovarian cyst, which was closely adherent to the parietes and visceral peritoneum in almost the whole of its extent, and to the great omentum. These adhesions could, by the exercise of considerable force, be ruptured without tearing the cyst, which was thus removed entire. The cyst also had very firm adhesions to the pelvis. The pedicle (formed by the parts in the right broad ligament) was very broad, and of considerable length, so that the neck of the sac could easily be pulled out of the abdomen. Numerous very large veins (tributaries of the ovarian veins) ran in the pedicle. The sac was almost empty, a little gelatinous fluid being all that it contained. The puncture did not communicate with its cavity, although it was open through the abdominal muscles, the opening in the sac having healed. In several parts of the cyst wall was a deposit of colloid consistence, which exhibited under the microscope an abundance of caudate cells. Some of the healthy tissue of the ovary was found on the left and opposite side.

EDWARD MOORE, Esq., F.R.C.S., of Hales-Owen, for many years past a Worcestershire magistrate, was on Friday, the 12th inst., gazetted as a Deputy-Lieutenant for the same county.

THE LONDON AND PROVINCIAL HOSPITAL PRACTICE.

THE MODERN TREATMENT OF STONE IN THE BLADDER, AND ITS RESULTS.

At page 32 of the *Medical Times* for January of the present year the reader will find a statistical analysis of 186 lithotomy operations performed in the different London Hospitals during a period of three years and a-half. At page 13 of the Journal for July 2 is a similar analysis of the cases operated on in certain Provincial Hospitals during a nearly similar period, and numbering 177. (a) The results of lithotripsy in London Practice were similarly investigated at page 59, January 15, and those of the same operation in the Provincial Institutions at page 35, for July 9. Lastly, we took under investigation the operations for stone in the female, which, including the London and Provincial Institutions together, numbered 23, and which may be found cited with detailed comments in our Journal for July 23, page 82.

We now propose to take the whole together, and to institute comparisons, first between the results of London and Provincial Practice, and, secondly, between those of lithotomy and lithotripsy.

If we could add to our list the cases in which, during the same period, and in the same Hospitals, the patients have died of stone without having been operated on, our balance-sheet would be yet more complete. A certain number do so die every year. We should suppose that it is very small, probably not amounting to more than half-a-dozen annually in all the London Hospitals taken together. We have recently noticed the fact of several such deaths. They usually occur in patients admitted in the last stages of suffering and debility, who sink within a few days of their admission. In respect to London Hospital Practice, from long personal experience, we can speak most positively, that it is not the custom to refuse any cases, however bad. If any sort of selection had taken place, the London statistics would appear to far better advantage than they do. Many of the deaths after lithotomy happened to patients whose state was such that any Surgeon who could have brought himself to regard his own reputation for success as of the first consequence, and his patient's chance of benefit as of the second, would have been most certainly refused. Indeed, in more than one instance which we well remember, the operation scarcely afforded any better prospect to the poor sufferer than that of mitigating his misery during his few remaining days or hours. Against these cases, however, we must put two or three in which recovery ensued under the most unhopeful circumstances, and when the operation had been performed only at the patient's urgent request. These latter have been sufficiently numerous to most fully justify the rule adopted by metropolitan Surgeons, of always operating, however ill the patient may be, provided there appears to be no hope of improving his general health by preparatory treatment. Whether or not this rule is carried out to the same extent in our Provincial Hospitals we do not know. If it is not, the difference in result between the London and Provincial Institutions is to a certain extent accounted for.

GENERAL RESULTS.—(BOTH SEXES.)

The total number of stone cases coming under surgical treatment during the periods referred to, including females, appears to have been 467. Of these, 386 were cured, 3 were discharged unrelieved (after lithotripsy), and 78 died. In 408 instances, lithotomy was performed (all ages, but chiefly children,) with 341 recoveries, and 67 deaths. Lithotripsy was performed in 37 instances (all but one adults), with 23 recoveries, 2 subsequent lithotomy cases, 3 discharged unrelieved, and 9 deaths. The cases of stone in the female were 24; and of these, 22 recovered, and 2 died. The aggregate fatality of operations for stone would thus appear to be 1 in 6 in males, and 1 in 12 in females.

(a) Since that report was published, we have discovered that the cases operated on during 1856 were accidentally omitted. They will, of course, be now included. It is a remarkable and interesting fact, as showing that our calculations do very closely approximate the actual truth, that the addition of this year's cases, 45 in number, does not make any appreciable alteration in the proportionate numbers as regards age, recovery, etc. etc.

Throughout the remainder of our report, we shall exclude the 24 cases of stone in females, and deal only with the 443 cases occurring in males.

COMPARISON BETWEEN LONDON AND PROVINCIAL PRACTICE.—(MALES ONLY.)

The relative proportion of cases treated by lithotomy and lithotripsy respectively appears to be about the same in our London and Provincial Institutions. The same rules of selection appear also, with some exceptions, to prevail in both, as well as in individual Hospitals. Lithotripsy is, as a rule, never performed in children; and the circumstance of the patient being in unusually bad health is regarded as a reason for preferring lithotomy. In one or two instances, however, the reports supplied to us state that the stone was crushed because the man was thought too ill to bear the larger operation; but these are very exceptional. The selection of the one or other operation for adults in good health appears, however, to have been very arbitrary, and has, we believe, in many instances, been decided by the patient's own preference. It does not appear, judging from the data before us, and from what we know privately, that any of our Hospital Surgeons make it an invariable rule of practice to employ the lithotrite in all cases of stone in adults of fair general and local health.

The appended statement gives the aggregate results of the two modes of operating:—

Metropolitan.

Whole number,	207;	recovered,	157;	died,	47;	1 death in 4.4.
Lithotomy .	186;	"	146;	"	40;	" 4.65.
Lithotripsy .	21;	"	11;	"	7;	" 3.

Provincial.

Whole number,	238;	recovered,	207;	died,	29;	1 death in 8.
Lithotomy .	222;	"	195;	"	27;	" 8.22.
Lithotripsy .	16;	"	12;	"	2;	" 8.

In the first of the accompanying tables the same cases are classified according to the ages of the patients, both lithotomies and lithotrities being taken together.

Thus, then, we have the fact brought clearly out that of every four cases of stone in males (all ages) submitted to Surgical treatment in the London Hospitals, one ends fatally, while in the Provincial Institutions the fatality is only one in eight. Before attempting to ascertain the probable causes of this startling difference, two questions present themselves for answer. In the first place, Are the two series of cases sufficiently alike to be properly made the subjects of comparison? And in the second place, Are the data of which they consist equally trustworthy in both? The first of these we would answer without hesitation in the affirmative; the two series of cases do bear a very close similarity to each other, *i.e.* in each the relative proportions of patients at different ages closely correspond, while nearly the same rules appear to have influenced the minds of the different operators as to the performance of lithotomy or lithotripsy. In the latter point, indeed, the advantage is rather on the side of the Metropolitan series, since it includes a larger proportion of lithotripsy cases, which, as we shall hereafter see, is the less fatal operation in the adult. In replying, or attempting to do so, to the second question, we tread on different, and very delicate ground. It must, we think, be granted that the accuracy of the two series is not equally well guaranteed. Both in London and in Provincial Hospitals, our Statistical Reports have been, in the first instance, compiled from data supplied to us by the Resident Medical Officers of the respective Institutions. Thus far, therefore, the modes of procedure, and the probability that all cases would be recorded, are the same in each. In London, however, the writer of this report was himself engaged in daily attendance on the practice of the different Hospitals, and was in the frequent habit of looking through the "Operation Books" himself. Without making the slightest reflection on the integrity of those to whose zeal we are indebted for the Provincial data, the simple statement that the additional security of completeness just mentioned, was in the case of their Institutions not brought to bear, will be sufficient to prove that the facts in the two series are worthy of different degrees of reliance. We may venture to strengthen the proof by stating that in certain instances cases did find their way into our London list of deaths, through our own personal supervision, which would not otherwise have done so. We shall here leave this matter, and our readers must

form their own conclusions as to the allowance which ought to be made on the ground referred to.

Whatever allowance individual readers may incline to make on the score above mentioned, none can entertain a doubt that our statistics really prove that a great difference in result does obtain in our Provincial and our Metropolitan Hospitals.

The apparent difference is so great, that it is impossible but that a considerable part of it must be real. It will be seen also that it is almost equal, whether we examine the lithotripsy series or the lithotomy one. To what, then, are we to attribute it? We may fairly presume that the amount of surgical skill to be met with in the two series of Hospitals is equal, and we

WHOLE NUMBER OF STONE CASES IN MALES, ARRANGED ACCORDING TO AGE.

Age.	Number of cases.		Recovered.		Died.		Proportion of Deaths.

The Provincial Lithotripsy List, as given at page 35, for July 9, includes 17 cases; of these we have been obliged to omit Case 8, not having sufficient particulars. Two of the cases (2 and 16) were cured by lithotomy afterwards; these, therefore, although included in the first column above, are not counted either in Recoveries or Deaths.

(a) Three of the London Lithotrities cannot be counted among the Recoveries, as the patients left the Hospital "unrelieved." Two of the Provincial ones are also omitted in this column, lithotomy having subsequently been adopted.

believe that the same rules of practice prevail in each, *i. e.* the ordinary lateral operation was performed in almost all the cases. We have already observed that the ages of the patients very closely correspond. Two circumstances remain for consideration as possible causes of the difference. 1st. The Provincial Hospitals may possess great sanitary advantages over our London ones. 2nd. The class of patients admitted under Provincial Surgeons may possess far better constitutions as regards ability to bear severe operations, than do those who enter our London Hospitals. Probably both these suppositions are true to a certain extent, but the latter has, we suspect, vastly the wider range of influence. Let us glance at the following facts:—Out of 109 children under the age of ten lithotomised in the London Hospitals only 8 died, and exactly the same number was lost of 113 patients of the same age operated on in the Provincial ones. Here the London fatality is 1 in 13.5, and the Provincial 1 in 14, in fact, the results scarcely differ, whilst the whole number is quite sufficient to supply data for fair comparison. Now, if the sanitary advantages of the two series of Hospitals were very different, ought not the effect to be at least equally apparent in the case of young children as it is in that of adults? As we leave the age of infancy, the difference, however, becomes marked, and it increases almost steadily with each decade. Between 10 and 25 the London fatality is 1 in 5, and the Provincial 1 in 9. Between 25 and 45, the London deaths are exactly in twice the proportion of the Provincial ones. Between 45 and 60 the difference is much greater, London losing one-half and the provinces only 1 in 5. In the oldest class of patients that is, those between 60 and 80, the metropolitan mortality reaches its alarming maximum of three-fourths of the whole number, whilst in Provincial Institutions it is only one-third. Do not these facts prove to a demonstration that there is a very great difference in the power of recovery after lithotomy, between our London and Provincial patients? The adult subjects of lithotomy in London are of two classes, those who have resided in the metropolis, and those who have been sent up from the country expressly for the purpose of operation. Probably the former of these two classes would include two-thirds, and the latter one-third of the whole, but in this matter we have no ascertained data to guide our conjecture. We need not here enlarge on the bad state of constitutional stamina in London adults of the poorer class, since it is sufficiently known. Intemperance, irregularities of all kinds, and city life do their work, and their effects usually become increasingly apparent as age advances. On the second class—that comprising cases sent up for operation from the country—we will venture one or two remarks. As a rule we do not believe that our provincial *confrères* select their best cases to send to our London Hospitals. At any rate, of this we are sure, that some of the very worst in the whole series were patients who had been so sent up for operation. Not unfrequently there is a history that lithotomy has been repeatedly tried, but that the bladder becoming more and more irritable and the patient's health failing, the case has been sent up to town for further measures. Then again, even supposing that our patients from the country were of average health, it is easy to see that their transference to the wards of a London Hospital, is likely to exert anything but a favourable influence. To a naturalised Londoner a London Hospital is a sort of palace, but its effects are very different upon a farm labourer who has been accustomed to the air of the Kent downs.

COMPARISON BETWEEN LITHOTOMY AND LITHOTRITY.

The reader will find on another page a concise tabular statement of the results of Lithotry both London and Provincial. The whole number of cases is but small.

The table in question shows that out of a gross total of 35 cases treated by lithotry, in which the patients were between the ages of 20 and 75, twenty-two resulted in recovery, four were unrelieved, and only nine ended in death. Granted that the rate of mortality is large, and far from satisfactory, it still contrasts favourably with that of lithotomy in patients between the same limits as to age. The gross fatality of lithotomy in adults, taking London and Provincial cases together, is rather more than one in three, while that of lithotry is one in four only.

Taking the London cases by themselves, we find that

between the ages above mentioned, rather more than half (26 out of 49) die after lithotomy, while only a third (7 out of 21) die after lithotry. It must be remembered, however, that three cases treated by lithotry remained unrelieved, and while in more than one instance the same patient was treated for a relapse of symptoms a year or two afterwards, his case is counted twice.

Taking the Provincial cases by themselves, we find that between the ages mentioned, not quite one-fourth die after lithotomy (18 in 74), while the lithotry mortality rate is only one in seven and a-half (2 in 15). Two of the lithotry patients were, however, after long treatment, finally submitted to lithotomy, and the remark made above as to the unavoidable multiplication of cases by counting the same twice, applies, we believe, with equal force to the Provincial as to the London series.

Allowing, then, that to a certain extent the best cases are selected for lithotry, we cannot say that the results obtained are very triumphantly in favour of that operation. Still the balance of evidence, especially in patients past middle life, is certainly, and beyond dispute, to its advantage.

SATURDAY, AUGUST 20.

THE LICENTIATES AND THE DOCTORATE.

THE Explanatory Document lately issued by the Council of the Edinburgh College of Physicians, to which we have already called attention, contains one very important remark, in reference to the title which Licentiates of their College should assume. The Council say that unless the authorities solve the question, and find for the Licentiates of the College some more handy and manageable title than that of "Licentiate of the College of Physicians," the Licentiates will themselves take the initiative, and baptise themselves. Now we must say that the sooner this question as to what constitutes a Doctor is settled, the more agreeable it will be both for Colleges and Universities. There is no use concealing the fact, that in this matter College and University are in direct opposition; for if men who possess the College licence are by courtesy permitted to take the title of Doctor, then away go all the privileges of University Rule. There are clearly many difficulties surrounding the solution of this question; and we therefore consider that it is one upon which the Medical Council may fitly express an opinion, or issue a decree. There can be no earthly doubt that to Universities belong the right of granting degrees, and to Universities alone; but still, custom, which overrides laws and decrees, has certainly got some few words to say in this matter; and custom has, undoubtedly, given on many occasions, and for many past years, the title of Doctor to Licentiates who were in possession of no University Degree. It is of course now argued by those M.D.-less Licentiates who assume to themselves the title of Doctor, that they have now just as much right to give the title to themselves, as others (though they were great magnates and College Dignitaries) had to give it, for their own especial purposes, to certain of their Licentiates. It is admitted that the title has often been given "in courtesy" to

their Licentiates by the London College of Physicians; and the fact therefore assumes the conclusion, that the doing so was not illegal. But if it was not illegal for the College to dub Licentiates, "Doctors," neither can it be illegal, it is argued, for Licentiates to dub themselves Doctors. We have been certainly told, again and again, that the Medical Act would prevent a Licentiate who had no degree, assuming the title of Doctor; but we believe that it has no such power. And this much, at all events, is positively true, that if it has the power, there is not the least chance of anyone attempting to put its powers in force at the present time. We see hundreds of Physicians, who possess no degree, through the length and breadth of this land, taking the title of Doctor. We see them doing this with impunity, as we have seen them do it for many a year past; and we also know that the number of such Practitioners is weekly on the increase. The Edinburgh College of Physicians has set this ball rolling; and where it will roll to no one as yet seems to have made up his mind.

This much, then, is perfectly clear, that the Registration Association has not attempted to grapple with the subject—knowing, we may fairly surmise, that the attempt to arrest, legally, a Licentiate of a College of Physicians in the act of taking the title of Doctor would be a most vain attempt; that the law would never sanction such a proceeding. But if the title may be thus assumed with impunity—as it has so often been in past days—and if the assumption of the title becomes daily more general throughout the country; if hundreds of respectable men, Licentiates of Colleges of Physicians, quietly carry on their business under the title of Doctor thus taken, does it not follow as most evident, that in a short space of time custom and use will consecrate the practice, and that it will at last come to this, that a Licentiate of a College of Physicians is virtually a Doctor? This seems to us to be inevitably the result of the state of things as they now stand before us. And the consequence of this must necessarily be, that in the end the Universities will be seriously injured; because the Profession will have discovered a new way of becoming Doctors, cheaper and more expeditious than the old way.

The time has come when this very serious question must be fairly met and answered, for it is useless to suppose that it can be much longer blinked; and we would suggest that the different Colleges of Physicians should endeavour to take joint action in the matter, and then confer with the Universities upon the subject. The interests of the Profession at large, as well as of the M.D.-less class of Licentiates, demand that this should be done.

One simple solution of the question is offered by the Universities to the Colleges, viz., that the Colleges shall grant their Licence to no man who does not possess the title of M.D.; but to this the College of Edinburgh objects that it is a mere farce to compel a man of standing to go through the process of getting a Degree—of paying so much money, in fact—and of gaining thereby no wit more of standing or repute. Besides, as the College well knows, if they get the Degree they won't want the Licence. And they argue also—not, it must be confessed, without a show of reason—why should we force a man who has passed the superior scrutiny of the College of Surgeons and Apothecaries' Hall to go through the farce of an inferior examination at St. Joseph's or St. Michael's, merely for the sake of putting a certain number of fees into the pockets of obsolete Professors? We, the College, are as good as they, at all events; and the fact of it is, that in the extremely muddled condition of the Profession in this country, a Physician is a Doctor and a Doctor is a Physician; and the Licence of a College of Physicians is just as good as the diploma of a Royal Jacobite University. This is how the College argues.

Now we take leave to suggest as a possible exit from this imbroglia, the following idea:—That Universities should issue to men of certain standing, and possessed of certain qualifications, *ad eundem degrees*; and that Colleges of Physicians should refuse to admit to their Licence every one who does not possess a Degree from some recognised University. We see perfectly well that objections may be taken to this position; but we can only say in answer, that no scheme can be proposed to which objections may not be raised, and for the reason that there are conflicting interests to be reconciled. After reflecting well upon the matter, we have come to the conclusion, that the scheme we suggest is less open to objections than any other which can be proposed; and more likely than any other to satisfy contending interests.

THE WEEK.

At the time of going to press, the trial of Dr. Smethurst in the Central Criminal Court, was not concluded. The case for the prosecution has been closed, Serjeant Parry has addressed the jury in behalf of the prisoner, and Medical evidence has been brought forward in his favour. Serjeant Ballantine had replied, and the Chief Baron had concluded a most impressive charge. Several points of extreme scientific interest have arisen. A source of error, unknown before this case, in Reinsch's test for arsenic has been discovered. The question has been argued whether chlorate of potash does or does not favour the elimination of arsenic or other mineral poisons. It has been shown that some medicines in common use, such as trisnitrate of bismuth, grey powder, sulphate of copper, &c., contain arsenic or antimony, or both. The influence of pregnancy in causing dangerous vomiting and dysentery has been the subject of conflicting evidence. The symptoms and morbid appearances of slow arsenical and antimonial poisoning have been contrasted with those of various forms of dysentery. And the proper conduct to be pursued by a Medical man in a case of suspected poisoning has become the subject of legal comment. All these points require and shall receive a full notice from us; but, looking to their extreme importance, and the fact that the result of the trial is not yet known, we shall defer both the report of the Medical evidence, and our own comments upon it, until next week.

We would especially call the attention of our readers, and of those concerned, to one particular "amendment, which was moved and carried" at the Medical Council. It is this:—"The General Council is of opinion that for the future no licence or degree should be given by any of the Bodies in Schedule (A) of the Medical Act, without examination." The importance of this opinion cannot be exaggerated. It seems to cut at the present year-of-grace-licensing both of the College of Physicians of London and College of Physicians of Edinburgh, and would seem to indicate that this licensing ought to be put a stop to—in the opinion of the Medical Council at least. We are particularly surprised to find such an amendment moved by Dr. Alexander Wood. What effect will it have? Will the Edinburgh College issue no more licences without examination?

A most ingenious Yankee has struck out a clever notion. His object is to shut up the Blue noses, or, in other words to put a Yorkshire blade on a Halifax handle, as Sam Slick terms doing a Britisher. He clearly has a full appreciation of the estimate at which an enlightened English audience will value our notable Medical Register. He boasts to the world that he is not registered; taking, no doubt, a very cosmopolitan view

of Medical science. We at once publish his advertisement for the benefit of those of our own non-registered Professional brethren who are given to the publishing of their wares and their curative abilities; and also for the information of the Medical Council, and of prosecuting Medical Associations. We are curious to see what they will do with it. Here is the Doctor speaking for himself; and here also one or two specimens of the enlightenment of a Sheffield audience. Here is what he says he can do; and here are the endorsements of his assertion. Can anything be more complete?

"Go and hear the American Botanic Doctor's Lecture every evening at seven o'clock. Admission free. Startling facts! Thousands have been cured during the last ten years, by

"DR. THOMAS AIREY, M.D. M.R.C.P. M.N.Y.P.S., New York, America, (*not Registered in England*), who may be consulted daily. Advice free on all Diseases incident to the human frame, at his Lecture-hall, next door below Messrs. Sidney and Stables, Old Fruit-market-place, Sheffield.

"Mrs. Hannah Ely, 6, Whitecross-yard, Briggate, Leeds. I have suffered very much from the epidemic in my thumb for one month; it has been cured by Dr. Airey.

"Mr. Thomas Robinson, dyer, Battley Carr, had the tic four months; cured by Dr. Airey in one minute.

"Mr. Christopher Griffin, Murmur-green, Wolverhampton, afflicted with consumption for twelve months, had been under the Infirmary Doctors eight months, and turned away incurable; cured by Dr. Airey in two weeks."

Our readers will have learnt, in our last number, that the Medical Council had met and done some work. They, in the first place, proceeded to settle the amount to be allowed in the way of fees for attendance and travelling expenses, and then they passed a variety of resolutions. They decided, in answer to a request from the India Board, that they could see no reason why the registration of Surgeons and Assistant-Surgeons serving in India should be dispensed with. They also inform us, that it is no business of the Council to institute prosecutions for offences against the Act; and that, indeed, if they had the will, they have not the money to do so. The price of the Register is reduced to 4s., which is still too high a price; but those who had the misfortune to pay 7s. 6d. for it, shall have the next edition of it gratis. Special claims for admission to the Register's pages were considered, and we are happy to find that the name of J. Kahn, M.D. Erlangen, of venereal museum notoriety, has not been permitted to register; and also, that a Yankee homœopath could not be admitted. A very important proposal, viz. a union for joint licensing by the Colleges of Physicians and of Surgeons of Edinburgh was approved of; and we can now hope that the London Colleges will soon obtain a like approval, especially as the proposal was seconded by Mr. Lawrence. The Council in future will hold their meetings at the College of Physicians of London, having accepted accommodation offered them there. Minutes of the later meetings will be found in another part of this number.

Mr. Sidney Herbert, we are happy to record, has on more occasions than one exhibited a very laudable determination to come out of the trammels of red-tape. Here is a small but most important particular we have in illustration of the fact. He stated the other day in the House of Commons that,—

"He thought the men themselves would be far better judges which knapsack it would be most convenient for them to carry than any Board of Officers could be. He had, therefore, ordered a number of Berrington's knapsacks, as well as some of the knapsacks invented by Colonel Spiller, to be served out to the companies of certain regiments, with a view to their being tested by practical experiment."

That his wisdom has not yet reached to that sink of red-tapeism—India—is clear from the following:—

"Poonah, July 4.—Every one here, or at least every Indian, is in great alarm at the absence of the rains, which ought to have commenced about the 4th of June; and they predict fevers and all manner of horrors unless the rains come soon. It is very hot now, and because the cool weather ought to have begun we are made to wear winter clothing, i.e., black cloth trousers and shell-jackets, and no cap covers! It seems odd that having held India so long, we should not have found out that Europeans cannot wear the same things as in England."

GENERAL COUNCIL OF MEDICAL EDUCATION & REGISTRATION.

MINUTES OF MEETING AUGUST 9TH, 1859.

Royal College of Surgeons of England.

Sir BENJAMIN C. BRODIE, Bart., President, took the chair at two o'clock, p.m.

Present—

Dr. Thomas Watson.	Dr. A. Smith.
Mr. Green.	Dr. Williams.
Mr. Nussey.	Dr. Leet.
Dr. Acland.	Dr. Apjohn.
Dr. Bond.	Dr. Corrigan.
Dr. Embleton.	Sir James Clark, Bart.
Dr. Storrar.	Sir Charles Hastings.
Dr. Alexander Wood.	Mr. Lawrence.
Dr. Andrew Wood.	Mr. Teale.
Dr. James Watson.	Dr. Christison.
Mr. Syme.	Dr. Stokes.

Dr. Francis Hawkins, Registrar.

The Minutes of the last meeting were read and confirmed.

The following letter was read:—

"The London Medical Registration Association,
"5, Charing Cross, London, S.W.

"August 9th, 1859.

"To the President of the General Medical Council.

"Sir,—I think it right that the Medical Council, over which you preside, should be informed, that upon applying at the Lambeth Police Court for the penalty of 40s., in 'Re the London Medical Registration Association v. Nunn,' for the purpose of paying the same over to the Treasurer of the Medical Council, I was informed, by the Clerk of the Court, that the Police Court Act, 2 and 3 Vic., cap. 71, s. 47, ordered that the penalty should be paid over to the 'Receiver of Police,' Clause 42 of the Medical Act notwithstanding, and such penalty will be so paid, unless the Medical Council prove their right to receive the same, before the Police Magistrate at that Court.

"I have the honor to be, Sir,

"Your obedient Servant,

"T. E. LADD, M.D., Hon. Sec."

Referred to the Executive Committee.

1. The case of Richard Organ having been taken into consideration, it was moved by Dr. ANDREW WOOD, seconded by Mr. SYME—That the case of Richard Organ be delayed till the opinion of counsel has been obtained in regard to it.—Agreed to.

2. A memorial having been read from the Royal College of Physicians of London, relative to the 47th Section of the Medical Act, it was moved by Dr. ALEXANDER WOOD, seconded by Dr. WILLIAMS—That the Medical Council disapprove of the latter part of Clause XLVII. of the Medical Act, and will give all assistance that they legally can to the London College of Physicians to obtain the alteration of the Medical Act suggested in the memorial.—Agreed to.

3. A letter was read from the Registrar of the King and Queen's College of Physicians in Ireland, communicating copies of letters received from the Director General of the Army Medical Department, on the subject of his intended recognition of the certificate of the Company of the Apothecaries' Hall of Ireland, as a licence to practise Medicine; also a statement embodying the views of the President and

Fellows, on the right of practice which the certificate of the Company confers; also a reply to that statement presented by Dr. LEE.

Moved by Dr. SMITH, and seconded by Dr. CORRIGAN—That it is the opinion of this Council, that the Licence of the Apothecaries' Hall of Ireland is not equivalent to a Degree or Licence in Medicine from a University or College authorised to grant such, as, from a perusal of the Apothecaries' Act, 31 Geo. III., there does not appear to be any provision or authority for examining in Medicine; and, further, that if a candidate be rejected by the Apothecaries' Hall of Ireland, the Apothecaries' Act, sec. 23, declares, that the rejected candidate may appeal to the King and Queen's College of Physicians of Ireland, who are then authorised to reverse such decision, if it seem fit to them, and to grant to such appellant the right to practise the art and mystery of an Apothecary without any examination in Medicine.

Amendment moved by Dr. STORRAR, and seconded by Dr. CHRISTISON—That the words "Licentiate of the Apothecaries' Hall, Dublin," having been introduced into Schedule (A) of the Medical Act, such Licentiate is, by sec. 34, declared to be a "legally qualified Medical Practitioner," or "duly qualified Medical Practitioner."—Further than this the Medical Council feel themselves incompetent to express an opinion on the subject before them.

Votes taken; amendment negatived.

The motion was then put and carried.

4. Dr. STORRAR presented the following Report of the Education Committee:—

I. GENERAL EDUCATION.—The Education Committee of the Medical Council having given their attention to various plans for ensuring and testing the General Education of Medical Students, are of opinion that it is desirable:

1. That all Medical Students shall pass an examination in general education, before they commence their Professional studies.

2. As far as it may be practicable, to accept testimonials of proficiency granted by the National Educational Bodies, according to the following list, with such additions as the Medical Council may from time to time think proper to make.

A Degree in Arts of any University of the United Kingdom or Colonies, and such other Universities as may be specially recognised from time to time by the Medical Council.

Oxford Responsions or Moderations.

Cambridge Previous Examinations.

Matriculation Examination of the University of London.

Oxford Middle Class Examinations, Senior and Junior.

Cambridge Middle Class Examinations, Senior and Junior.

Durham Middle Class Examination.

Dublin Entrance Examination.

An Examination by any other University of the United Kingdom, equivalent to the Middle Class Examinations of Oxford and Cambridge.

3. That the Examination on General Education be eventually left entirely to the Examining Boards of National Educational Bodies, recognised by the Medical Council.

4. That candidates who shall not produce any of the testimonials referred to in the second resolution, shall be required to pass an examination in Arts, established by any of the Bodies named in Schedule (A) of the Medical Act, and approved by the General Council; it being provided that such examination shall be, in every case, conducted by a Special Board of Examiners in Arts.

5. That without professing to lay down any complete scheme of general education for persons intending to become Members of the Medical Profession, the Committee recommend that the scheme of examination in Arts of the Licensing Bodies be as nearly as practicable that of any one of the National Educational Bodies above specified.

6. That on and after October 1st, 1860, all Medical Students shall be required to be registered by one of the Bodies named in Schedule (A) of the Medical Act.

7. That the lists of Students registered shall be closed within a week after the commencement of each Session.

8. That no Student beginning Professional study after September 1861, shall be registered, who has not passed an Arts Examination, in conformity with resolutions 2 and 4.

9. That the Committee are of opinion that the age of twenty-two is, in most instances, the earliest age at which the Professional education should be completed, and that four years of Professional study should be required. The Committee are, however, not decided, that under certain circumstances, the examination might not be passed at an earlier age, provided the general examination had been passed full four years before the Professional.

II. PROFESSIONAL EDUCATION.—The Committee having recommended that, as a general rule, the earliest age of Professional examination for a licence to practise shall be twenty-two, and that four years shall be passed in Professional study, the Committee have further to recommend:

1. That the Registrar be directed to obtain returns of the courses of study and examinations of the various National Educational Bodies, enumerated in resolution 2, and that they be printed, and transmitted to the various Licensing Bodies named in Schedule (A) of the Medical Act.

2. That the Professional examination should be divided into at least two distinct parts;—that the first should not be undergone till after the termination of the Second Winter Session; nor the final examination till after the termination of the Fourth Winter Session.

3. That the first Professional examination shall be conducted partly on paper, and partly *viva voce*; and that such subjects as admit of it, shall be made as practical and demonstrative as possible.

4. That the second examination shall be conducted partly on paper, partly *viva voce*; and, as far as is convenient and practicable, clinically.

5. That the Professional examinations shall be held by the several Licensing Bodies, at stated periods (except in special cases), to be publicly notified each year.

6. That regular returns be required from the Licensing Bodies under Schedule (A), stating the number of candidates who have passed their examinations and of those who have been rejected, and that the Examining Bodies should be invited to express their opinion on the general character of the examinations, as to the qualification of the candidates.

The Education Committee have had referred to them the returns from the several Licensing Bodies, named in Schedule (A) of the Medical Act, of the Professional Education adopted by each of them; they have considered the question, whether it is desirable to lay down one general scheme of subjects of examination, such as should be recommended as a minimum to every Examining Body.

They are of opinion that they have no power under the Act to dictate forms and details of examination to the Examining Bodies as to Professional education. But inasmuch as by sections 18 and 20 of the Medical Act, it is the clear duty of the Council to satisfy themselves that the Licensing Bodies do conform to the intention of the Act with respect to the examination, they think it their duty to recommend that the Council should immediately lay before the several Examining Bodies the resolutions which they now submit to the General Council.

(Signed) JOHN STORRAR,
Chairman.

Moved by Dr. ANDREW WOOD, seconded by Dr. APJOHN—That the Report of the Education Committee be taken into consideration by the General Medical Council, as the first business to-morrow.—Agreed to.

5. Mr. NUSSEY presented the following Report of the Accommodation Committee:—

That the Committee having to acknowledge a communication from the President of the Royal College of Physicians, offering accommodation to the Medical Council at the Royal College of Physicians, recommend to the Council to accept this advantageous offer, and that the best thanks of the Council be communicated to the President and Fellows of the Royal College of Physicians.

That the Treasurer, Mr. Nussey, be requested to obtain, if found necessary, accommodation in the immediate neighbourhood of the College of Physicians, for the ordinary business of the Registration Office.

Moved by Mr. NUSSEY, seconded by Dr. STORRAR—That the Report of the Accommodation Committee be adopted, and that the Registrar be instructed to communicate the best thanks of the Council to the President and Fellows of the Royal College of Physicians of London.—Agreed to.

6. Moved by Dr. ACLAND, seconded by Mr. GREEN—That whereas representations have been made to the Finance Committee of the General Council, concerning the unexpected amount of labour which has devolved on the Registrar and on the Clerks of the Medical Council, it is expedient that the question of the duties and salaries of the Registrar, and of the Clerks of the General Council, be referred to a Committee to report thereon; the Committee to consist of.

Dr. Storrar. Dr. Smith.
Dr. Stokes. Mr. Nussey.—Agreed to.
Confirmed, B. C. BRODIE.

MINUTES OF MEETING, AUGUST 10TH, 1859.

Sir BENJAMIN C. BRODIE, Bart., President, took the chair at two o'clock, p.m.

The same Members were present as on the previous day.

The Minutes of the last meeting were read and confirmed.

1. The Report of the Committee on Education was taken into consideration.

Moved by Dr. STORRAR, and seconded by Dr. STOKES—That the Report be adopted generally by the Council, and that it be discussed clause by clause.

Amendment moved by Dr. THOMAS WATSON, and seconded by Mr. SYME—That the Report of the Committee be received, and that the Committee be requested to put it into such a form as they may consider desirable for its circulation among the Bodies named in Schedule (A), and to produce the Report so prepared, to-morrow, at the General Council.

Votes taken, and amendment carried.

2. Dr. ALEXANDER WOOD presented the following Report of the Committee appointed on the case of Henry Scott, and for Conference with the London Medical Registration Association.

(REPORT.)

I. CASE OF HENRY SCOTT.—The Committee has laid before counsel an opinion on this case for advice, but his opinion has not yet been received. The Committee beg to recommend, that if the opinion comes in time, it should be at once taken up by the Council; and, if it does not, it should be referred to the Executive Committee.

II. CONFERENCE WITH LONDON REGISTRATION ASSOCIATION. The Committee have to report, that they received a deputation, consisting of ten members of the London Medical Registration Association.

That several of the gentlemen addressed the Committee, and that they have since, on the suggestion of the Committee, handed in a written statement, containing an expression of their views; this document the Committee beg leave to lay on the table, but they do not think it necessary to occupy the time of the Council by reading it, as the principal points to which it refers will be commented on in the Report.

III. METHOD OF ENTERING NAMES IN THE REGISTER.—The deputation complained of various inaccuracies in the Register. As far as the Committee can judge, these inaccuracies appear to consist chiefly of clerical or typographical errors. The Committee suggested to the deputation, that a list of these should be furnished to the Registrar for the correction of the next issue.

In regard to the suggestions made by the deputation for additional checks on the entrance of names on the Register, your Committee are of opinion, that the Council are not entitled to exercise greater stringency than the Act of Parliament sanctions them in doing. The Act clearly affords liberty for entrance on the Register in any one of the three following ways:—

1st. Production to the Registrar of the branch Council of the document conferring or evidencing the qualification.

2nd. Transmission, by post, to such Registrar, of information of his name and address, and evidence of the qualification or qualifications in respect whereof he seeks to be registered, and of the time or times at which the same was or were respectively obtained.

3rd. A liberty is given to the several Colleges and Bodies mentioned in Schedule (A), to transmit certified lists of the persons who, in respect of qualifications granted by such Colleges, are qualified for registration under the Act; and

all persons in such lists may be admitted to the Register without the production of any other evidence.

The Committee are of opinion, that the penalties imposed by the Act, form the only check that can be looked for on registration by false pretences; but that it would facilitate the detection, and, therefore, the prevention of such attempts, were the Council to pass the following enactment:—

“That during the first week of each month, the Registrars for Scotland, England, and Ireland, be instructed to publish, from time to time, as the Branch Councils may direct, the names, addresses, and qualifications entered in their local register during the preceding month.”

IV. METHOD OF KEEPING THE REGISTER.—The Committee are sorry to be obliged to report that there is too much reason for the complaint that the Register has not been kept as it should have been, and of this the Council were aware before it was brought under the notice of the Committee by the deputation. The Registrar explains that the hurry and bustle attendant on the first registration prevented due attention being paid to this important department. The Committee beg to recommend that the General Council do now, in conformity with section 16 of the Act, make the following Orders for Regulating the Registers:—

ORDERS.

No. 1. That where any person entitled to be registered under the Medical Act applies to the Registrar of any of the branch Councils for that purpose, such Registrar shall forthwith enter in a local register, in the form set forth in Schedule D to the Act, or to the like effect, to be kept by him for that purpose, the name and place of residence, and the qualification, or several qualifications, in respect of which the person is so entitled, and shall affix to such entry in the Register the date at which it was made.

No. 2. That the Registrar of each branch Council shall, within two clear days (Sundays excepted) after he has received notice of any alteration in the addresses or qualifications of persons registered under the Act, or legal evidence of the death of any registered Practitioner, cause such changes to be made in the Register, or the name of such registered Practitioner who has died to be erased from the Register.

No. 3. That the registrars of the branch Councils for Scotland and Ireland shall keep an alphabetical list of those registered, and shall, on entering a name in the local register enter it forthwith also in its own place in the alphabetical list.

No. 4. That, as provided by the Act (Sect. XXV.), in the case of the Registrar for Scotland or Ireland, he shall, with all convenient speed, send to the Registrar of the General Council, certified under his hand, a copy of all the entries or changes so made in the local register.

No. 5. That the General Registrar shall forthwith cause such entries in the branch registers to be made in a list kept by him.

No. 6. That the General Registrar shall also keep, as directed by the Act, the General Register in alphabetical order, and shall, on receiving any additional name, forthwith enter it in such General Register.

No. 7. That each page of these registers and lists shall be verified by the signature of the Registrar.

V. PRICE OF REGISTER.—The deputation brought this subject under the attention of the committee, and were informed of the reduction of price already decided on by the General Council.

VI. PROSECUTIONS BY GENERAL COUNCIL.—The importance of this was strongly pressed on the attention of the committee, who replied, by directing attention to the resolutions already come to by the Council.

Moved by Dr. SMITH, seconded by Sir CHARLES HASTINGS—That the foregoing report be received and adopted.—Agreed to.

Moved by Dr. ALEXANDER WOOD, seconded by Sir CHARLES HASTINGS—That the Council, in conformity with Clause XVI. of the Medical Act, make the orders recommended in the foregoing report, Nos. 1, 2, 3, 4, 5, 6, and 7, for regulating the registers to be kept under the Act.—Agreed to.

3. Dr. CORRIGAN presented the following Report:

The committee appointed to report upon the communication from the Poor-law Board, beg to report as follows:—

The communication states that "the important question" upon which the Poor-law Board desires information is, "what is the exact extent and nature of the qualification which is obtained by the degrees or licences conferred by the several bodies which have made their application to the Board." That "the Board do not possess any authoritative information on the subject which they can act upon, and they therefore request to be informed by the General Medical Council how far the degrees or licences of the several bodies, by whom memorials have been addressed to the Board, confer respectively the right of practising Medicine or Surgery, or Medicine and Surgery, and an evidence that the persons to whom they are granted have obtained a competent knowledge of either, or both, of those branches of the Profession.

The several bodies referred to as having presented memorials are—

The University of Edinburgh,
Royal College of Physicians of Edinburgh,
Royal College of Surgeons of Edinburgh,
University of Glasgow,
Faculty of Physicians and Surgeons of Glasgow,
Marischal College and University of Aberdeen,
King's College and University of Aberdeen,
Royal College of Surgeons of Ireland,
University of London, and
Medical Protection Association of Cork,

which last-named Body, not being a Licensing Body, does not come within the scope of the inquiry.

The question put by the Poor-law Board consists of two parts—

1st. How far the degrees or licences of the several Bodies above enumerated confer respectively the right of practising Medicine or Surgery, or Medicine and Surgery? and,

2nd. How far the above qualifications are evidence that the persons to whom they are granted have attained a competent knowledge of either, or both, of those branches of the Profession?

With reference to the first part of the question, the committee deem it only necessary to observe, that in the words of Clause XXXI. of the Medical Act, "Every person registered under this Act shall be entitled, according to his qualification or qualifications, to practise Medicine or Surgery, or Medicine and Surgery, as the case may be, in any part of Her Majesty's dominions, etc.," and that the qualifications conferred by the several Bodies above enumerated, appear to the committee to be as follows:—

University of Edinburgh	Degree in Medicine.
Royal College of Physicians of Edinburgh ..	Licence in Medicine.
Royal College of Surgeons of Edinburgh ..	Licence in Surgery.
University of Glasgow	Degree in Medicine.
Faculty of Physicians and Surgeons of Glasgow	Licence in Surgery.
Marischal College and University of Aberdeen	Degree in Medicine.
King's College, Aberdeen	Degree in Medicine.
Royal College of Surgeons of Ireland	Licence in Surgery.
University of London	Degree in Medicine.

The second part of the question is—How far the above qualifications "are evidence that the persons to whom they are granted have attained a competent knowledge of either, or both, of those branches of the Profession?"

In reference to this, the committee desire to observe that the several Bodies above enumerated are Universities or Corporations legally entitled to grant degrees or licences in Medicine or Surgery, or in both; that their curricula require an education in all the important branches of the Profession; and that it is the opinion of the committee that a perfect equality of privileges should be maintained throughout the United Kingdom.

D. J. CORRIGAN, Chairman.

Moved by Mr. TEALE, seconded by Dr. EMBLETON—That the report of the committee appointed to report upon the communication from the Poor-law Board be adopted.

Amendment moved by Dr. WILLIAMS, seconded by Dr. ALEXANDER WOOD—That the report be adopted, with the addition, after the word "Privileges," in the last line but one, of the words "among the Graduates and Licentiates of the Bodies above enumerated, according to their several qualifications."

Votes taken; amendment carried.

4. Mr. NUSSEY presented the Report of the Finance Committee.

Moved by Mr. NUSSEY, seconded by Dr. SMITH—That the Report of the Finance Committee be received and referred respectively to the Executive Committee and Branch Council for England, for the purpose of being carried out according to the recommendations contained therein.—Agreed to.

5. Moved by Sir CHARLES HASTINGS, seconded by Dr. ALEXANDER WOOD—That it is expedient that the proceedings of the Council be recorded in writing, in a book to be kept for that purpose.—Agreed to.

6. Moved by Dr. ACLAND, seconded by Mr. TEALE—That whenever a branch Council shall refer to the General Council the name of any person which it is deemed desirable to remove from the Register, the Registrar of the General Council shall be authorised to obtain the opinion of counsel on the facts and bearings of the case, before it is submitted to the General Council; and that such opinion of counsel shall accompany the statement of the case when it is brought before the General Council.—Agreed to.

7. A copy was presented of the regulations of the Royal College of Physicians of Edinburgh regarding its licence, with certain corrections rendered necessary by an agreement entered into by the College with the Royal College of Surgeons of Edinburgh, since the day of the passing of the regulations.

The foregoing regulations were referred to the Education Committee.

8. The following paper was read, which had been presented by the Royal College of Physicians of London:—

At a meeting of the Royal College of Physicians of London, held on Monday, August 8, 1859, it was resolved:—

1. That any person who shall have satisfied the College touching the sufficiency of his acquirements in general science and literature, and given proof, under examination, of his proficiency in the science and practice of Medicine and Midwifery, and who shall have complied with such other regulations as are or shall be required by the bye-laws of the corporation, may receive a licence to practise physic.

2. That no person licensed be empowered to vend, compound, or dispense any Medicines, except for patients under his own Medical care.

3. That every candidate be required to furnish proof that he has attained the age of twenty-one years.

4. That the preceding resolutions be submitted to the Medical Council, with an expression of the desire of this College to render these resolutions available for co-operation with the College of Surgeons in the licensing of general Practitioners.

9. The following letter was read, which had been referred to the General Council by the Scottish Branch Council:—

"Portree House, Fence Houses, Durham,
"June 28, 1859.

"SIR,—I am a Licentiate of your Faculty, and passed in 1852. This day I performed a post mortem examination, and gave evidence at an inquest, for which services the coroner informed me I was entitled to a fee of only one guinea, instead of two, which is the usual fee, because I was not a Member of the English College of Surgeons. He said, 'You are legally qualified to practise, but not to perform a post mortem examination, not being qualified in England;' therefore, that I was entitled only to the fee allowed a Medical witness, in giving ordinary evidence, viz. one guinea. On former occasions I repeatedly received two guineas for similar services. Will you have the kindness to let me know whether I can recover the full amount?"

"I am, Sir, yours respectfully,
"J. Watson, Esq., M.D." DUNCAN MATHESON.

Moved by Dr. JAMES WATSON, seconded by Dr. EMBLETON—That the Registrar be instructed to direct the attention of Mr. Matheson to Sect. XXXI. of the Medical Act, in reference to his letter, referred by Branch Council of Scotland to General Council.—Agreed to.

Confirmed, JAMES CLARK.

MINUTES OF MEETING, AUGUST 11TH, 1859.

In the absence of the President, Sir JAMES CLARK, Bart., was called to the chair, at two o'clock, p.m.

Present—

Mr. Green.	Dr. A. Smith.
Mr. Nussey.	Dr. Williams.
Dr. Acland.	Dr. Leet.
Dr. Bond.	Dr. Apjohn.
Dr. Embleton.	Dr. Corrigan.
Dr. Storrar.	Sir Charles Hastings.
Dr. Alexander Wood.	Mr. Lawrence.
Dr. Andrew Wood.	Mr. Teale.
Dr. James Watson.	Dr. Christison.
Mr. Syme.	Dr. Stokes.

Dr. Francis Hawkins, Registrar.

The Minutes of the last meeting were read and confirmed.

The opinion of counsel was read, respecting the 27th and 29th Sections of the Medical Act.

1. Moved by Mr. TEALE, seconded by Dr. ALEXANDER WOOD—That the name of Richard Organ be erased from the Register, in accordance with the provisions of Clauses 26 and 29 of the Medical Act.—Agreed to.

2. Moved by Dr. ALEXANDER WOOD, seconded by Sir CHARLES HASTINGS—That the case of Henry Scott be deferred till further legal opinion has been taken on it.—Agreed to.

3. Moved by Dr. ACLAND, seconded by Dr. ANDREW WOOD—That the opinion of counsel respecting Sections 27 and 29 of the Medical Act be referred, as proposed by the counsel, for consultation with one of the Law Officers of the Crown, as the counsel may think fit.—Agreed to.

4. Moved by Mr. SYME, seconded by Dr. ANDREW WOOD—That in all cases where a division has taken place, any Member of the Council may require that the names of the majority and minority shall be entered on the Minutes.—Agreed to.

5. Moved by Mr. NUSSEY, seconded by Dr. CHRISTISON—That the treasurers of the General Council be empowered to pay on account (from the sum of £500, voted last November towards the expense of the Pharmacopœia Committee), the sum of £100 to each of the secretaries of the sub-committees of London, Edinburgh, and Dublin, in order to meet the expenses incurred, in conformity with powers devolved upon them at a meeting this day of the General Pharmacopœia Committee.—Agreed to.

6. Dr. CHRISTISON presented the Report of the Pharmacopœia Committee.

(REPORT.)

The Pharmacopœia Committee of the Medical Council have to report as follows:—

The committee commenced operations near the end of December, divided themselves into three sub-committees, meeting in London, Edinburgh, and Dublin; and requested the co-operation of the Royal Colleges of Physicians, and the Pharmaceutic Society of Great Britain, who all appointed delegates to assist the sub-committees. The committee also appointed certain gentlemen to aid them as analytic chemists, pharmaceutic chemists, and botanical referees.

Many preliminary difficulties presented themselves in settling the principles of construction of the Pharmacopœia, and it was accordingly found necessary, after frequent meetings of the different sub-committees, to have a general meeting of delegates from the three committees, which could not be held earlier than May.

At this convocation the subject of the weights and measures to be employed in Pharmacy was settled. The principles of construction of the Materia-Medica List, or First Part of the Pharmacopœia, were fully gone into and settled. The extent and classification of the Second Part, which consists of formulæ for making the preparations and compounds of the Pharmacopœia, were likewise the subject of careful consideration; but, in some points, this last matter still remains undetermined.

It was also determined, at the convocation, how the labour of constructing the Pharmacopœia should be divided among the three sub-committees.

Since the convocation met, in the beginning of May, the sub-committees have completed a considerable amount of work of detail; the list of the various articles of the Materia-Medica has been agreed on and arranged, and many of the groups of the preparations are now almost completed.

R. CHRISTISON, Chairman.

7. Moved by Dr. ACLAND, seconded by Dr. STORRAR—That the report of the Pharmacopœia Committee be received, and entered on the Minutes.—Agreed to.

8. Moved by Dr. ALEX. WOOD, seconded by Dr. CHRISTISON—That five members, resident in London, be the Executive Committee, and that their duties be:—

1. To make up the annual accounts and compute the per-centage chargeable against each Branch Council.

2. To take the necessary steps for obtaining the law opinion ordered on 11th August.

3. To re-arrange the duties and salaries of the clerks.

4. To superintend the publication of the Register for 1860, as was agreed.

That the Executive Committee be instructed to keep regular written Minutes of their proceedings, and that these Minutes be printed, and circulated to the members of Council.—Agreed to.

9. Moved by Dr. ALEXANDER WOOD, seconded by Dr. STOKES—That the Executive Committee consist of Sir Benjamin C. Brodie, Bart., President; Sir James Clark, Bart.; Dr. Thomas Watson; Mr. Green, and Mr. Nussey.—Agreed to.

10. Dr. STORRAR, in conformity with the resolution of Council, dated August 10, presented the following report from the Education Committee, in the form they consider desirable for circulation among the bodies named in Schedule A.

The General Council of Medical Registration and Education having considered the question of education, and having referred it to a committee to report thereon, are in a position to express their views on certain parts of the subject. It is one of great extent, and divides itself into several heads, of which the most important may be specified as follows:—

I.—The Preliminary General Education.

II.—The purely Professional Education.

III.—The Conditions on which the higher qualifications in Medicine and Surgery should be granted.

The Council, looking at the importance, and complicated nature of the question, have determined to postpone the consideration of the second and third heads. They take this course, believing that it will tend to promote the reforms indicated by the provisions and the spirit of the Act of Parliament; for time will thereby be allowed for full consideration of such important points as the assimilation, as far as may be, of the purely Medical educational systems, and the providing that the higher degrees should be distinguished by corresponding academic rank, obtained by a full, and, as nearly as possible, equivalent academic education. The Council expect that by their next meeting they will be in a position to offer their views on those questions, and on others of corresponding magnitude. With these views, the Council have resolved to recommend the adoption, by the various educational bodies in the United Kingdom, of the following principles; and, although the present proceedings must be taken as referring to a part only of the subject, the Council do not doubt that the educational bodies and licensing corporations will lend their assistance to the carrying the spirit and intention of the recommendation into effect.

The Council do not apprehend, in suggesting a minimum of education, that such will or ever can become the only standard sought for or attained by Medical students. The varied requirements of the age, to say nothing of the probable operation of the Act of Parliament, will prevent the occurrence of any such result.

The Council are of opinion that no person should enter the Medical or Surgical Profession, who has not received an education in general knowledge such as will be equal, at least, to that required by the national educational bodies. They believe, that with the exception of a very few though important branches of knowledge, the education and mental training of the student destined for the Medical Profession

ought not to differ from those adopted for other professions. And, therefore, they are of opinion that it would be unwise and unnecessary to create any new machinery for this purpose.

The Council, however, with the view of meeting difficulties which may arise, have recommended, where it is necessary, the creation of Special Boards of Examiners in Arts, in connection with the Licensing Corporations.

They therefore call the attention of the licensing bodies to the following report from the Education Committee:—

REPORT OF EDUCATION COMMITTEE.—In presenting their report to the General Council, your committee beg leave to make the following remarks:—

The subject of general education has chiefly engaged their attention, inasmuch as general education naturally precedes special technical training; and also because, in the opinion of your committee, while the system of professional instruction, hitherto enforced by the general licensing bodies, is, perhaps, redundant rather than deficient, the provision made for the preparatory mental cultivation of a large proportion of Medical students has been confessedly imperfect. In considering the subject of general education, however, your committee have purposely abstained from entering into minute details. They are impressed with the conviction, that it would be prudent to beware of proceeding too suddenly, or of attempting too much towards the remedy of a wide-spread and long-existing evil, and they also believe that it is important to leave to the general Licensing Bodies the responsibility of ameliorating general education, conformably to the general principles recommended by your committee, as speedily and as effectually as may be compatible with the various circumstances in which they are respectively placed. Your committee have endeavoured to indicate the direction, rather than the precise path, in which the Licensing Bodies should go.

It may to some appear to be a grave omission, that your committee have not specially referred to the general education of candidates for Academic Medical Degrees; but your committee are of opinion, that this is precisely the part of the question which may be most safely postponed. On the one hand, the general educational requirement of Universities are for the most part sufficient; and if any deficiency in this respect should anywhere exist, your committee are convinced that it will be spontaneously remedied, without any special suggestion being made to that effect.

The Education Committee of the Medical Council have taken into consideration the two following resolutions of the General Council, dated August 3, 1859:—

1. That for the purpose of guiding the Council in coming to a determination, in conformity with Sect. 20 of the Act, respecting the sufficiency or insufficiency of the course of study and examinations of the several bodies whose regulations for their fellowships, licences, and degrees have been communicated to the Council, a committee be appointed to prepare a report, laying down a minimum of examinations and subjects of examinations, without which no qualification will be held, by the Council (Sect. 20), such as to secure the possession by persons obtaining such qualifications, of the requisite knowledge and skill for the efficient practice of their Profession; and that it be an instruction to the committee to report on the expediency or the reverse, of this Council recommending what, in their opinion, would constitute a sufficient course of general and professional education.

2. That a committee be appointed, to examine the returns by the different bodies included in Schedule (A), to report in regard to each of these as to how far the course of study and examination required by each is calculated to secure the possession by persons obtaining their respective qualifications of the requisite knowledge and skill for the efficient practice of their Profession; and to report to the Council. As also in regard to the most effective machinery for superintending the examinations, so as to secure that they shall conform to a standard of examinations in general and Professional education considered sufficient by the Council.

The committee have, therefore, given their attention—1st. To various plans that have been suggested for ensuring and testing the general education of Medical students; and 2ndly. The committee have considered and stated what conditions appear to them proper to be observed in Pro-

fessional examinations, even those which test the minimum qualifications for a Medical Practitioner, reserving their views concerning the higher degrees and qualifications to a future report.

I. GENERAL EDUCATION AND EXAMINATION.—The committee are of opinion that it is desirable:

1. That all students shall pass an examination in general education, before they commence their Professional studies.

2. That, as far as may be practicable, testimonials of proficiency granted by the national educational bodies, according to the following list be accepted, with such additions as the Medical Council may from time to time think proper to make.

A degree in arts of any University of the United Kingdom or the Colonies, or of such other Universities as may be specially recognised from time to time by the Medical Council.

Oxford Responsions or Moderations.

Cambridge Previous Examinations.

Matriculation Examination of the University of London.

Oxford Middle-class Examinations, senior and junior.

Cambridge Middle-class Examinations, senior and junior.

Durham Middle-class Senior Examination.

Dublin University Entrance Examination.

An examination by any other University of the United Kingdom, equivalent to the middle-class examinations of Oxford and Cambridge.

3. That the examination on general education be eventually left entirely to the examining boards of national educational bodies, recognised by the Medical Council.

4. That students who cannot produce any of the testimonials referred to in the second resolution, be required to pass an examination in arts, established by any of the bodies named in Schedule (A) of the Medical Act, and approved by the General Council; provided that such examination shall be, in every case, conducted by a special board of examiners in arts.

5. That without professing to lay down any complete scheme of general education for persons intending to become Members of the Medical Profession, the committee recommend that the scheme of examination in arts of the licensing bodies be, as nearly as practicable, similar to that of any one of the national educational bodies above specified.

6. That on and after October 1st, 1860, all Medical students be required to be registered by one of the bodies named in Schedule (A) of the Medical Act.

7. That the lists of students registered be closed within a week after the commencement of each session.

8. That no student beginning professional study after Sept. 1861, be registered, who has not passed an arts examination, in conformity with resolutions 2 and 4.

9. That the Registrar of the General Council be directed to obtain returns of the courses of study and of the examinations of the various national educational bodies, referred to in resolution 2 on general education, and that they be printed, and transmitted to the various licensing bodies named in Schedule (A) of the Medical Act.

10. That the age of twenty-one be the earliest age at which any professional licence shall be obtained, and that four years of Professional study be required after the examination in general education.

II. PROFESSIONAL EXAMINATIONS.—Although the committee at present refrain from any recommendations on the subject of Professional Education, they submit the following, in relation to Professional Examinations:—

1. That the Professional Examination be divided into at least two distinct parts; that the first be not undergone until after the termination of the Second Winter Session; and the final examination not until after the termination of the Fourth Winter Session.

2. That the first professional examination be conducted partly in writing, and partly *viva voce*; and that such parts of it as admit of it, be made as practical and demonstrative as may be possible.

3. That the second examination be conducted partly in writing, partly *viva voce*; and, as far as may be convenient and practicable, clinically.

4. That the Professional Examinations be held by the several licensing bodies (except in special cases), at stated periods, to be publicly notified each year.

5. That regular returns be required from the licensing bodies under Schedule (A), stating the number of candidates who have passed their examinations and of those who have been rejected, and that the examining bodies should be invited to express their opinion on the general character of the examinations, as to the qualifications of the candidates.

The Education Committee having had referred to them the returns of professional education, from the several licensing bodies, named in Schedule (A) of the Medical Act, have considered the question, whether it is desirable to lay down one general scheme of subjects of examination, such as should be recommended as a minimum to every examining body.

The Committee are of opinion that although no power is given under the Medical Act to the Council to dictate forms and details of examination to the licensing bodies as to professional education; yet that, by Sections 18 and 20 of the Medical Act, it is the clear duty of the Council to satisfy themselves that the licensing bodies do conform to the intention of the Act with respect to the examination. And the Committee therefore recommend, that the Council should immediately lay before the several Licensing Bodies the Report which they now submit to the General Council.

Signed, on behalf of the General Medical Council,

B. C. BRODIE, President.

Moved by Dr. ALEXANDER WOOD, seconded by Dr. EMBLETON—That the Report of the Committee on Education be adopted, and that twenty copies be sent to each member of the General Council.

11. Amendment moved by Dr. CORRIGAN, seconded by Dr. SMITH—That copies of the Report of the Education Committee be forwarded to the several bodies enumerated in Schedule (A), with the object of obtaining their views upon the two subjects of general and professional education.

Votes taken; amendment negatived.

Motion put, and carried.

12. Moved by Mr. NUSSEY, seconded by Sir CHARLES HASTINGS—That the best thanks of this Council are eminently due, and are hereby offered, to the Council of the Royal College of Surgeons, for their obliging and courteous accommodation during the present Session of the Medical Council.—Agreed to.

Confirmed, JOSEPH HENRY GREEN.

The Board of Medical officers appointed by the Duke of Cambridge to report on the Hospital tent which has been invented by Major Rhodes—one of which has been for some time in use in the grounds attached to the garrison Hospital at Chatham—having made a very favourable report of the invention, the Commander-in-Chief gave directions for another description of Major Rhodes's tent, called the "Field Hospital tent," to be pitched there.

SILK.—By recent experiments M. Schlossberger arrives at the conclusion, that he has shown the chemical identity of silk and the spider's web. He proposes to call their immediate principle *Sericine*, from *sericum*, silk.

GUY'S HOSPITAL.—At a Court of Committees of Guy's Hospital, held on Thursday, the 11th inst., his Royal Highness the Duke of Cambridge was unanimously chosen a Governor.

LONDON FEVER HOSPITAL.—An address, by Lord Montague, the President of the Hospital, earnestly pleading the cause of the charity, has been responded to by donations to the amount of £960, the half of which was contributed in one sum by Sir R. P. Glyn.

CHOLERA IN SCOTLAND.—The Registrar-General for Scotland says:—"A few suspicious cases of cholera have been reported, but those which occurred during July do not appear to have assumed the epidemic form, or to be other than rapidly fatal cases of autumnal cholera. As undoubted cases of epidemic cholera, however, have been brought to this country in vessels from Hamburg, it would be prudent for the local authorities to adopt those precautions which experience has proved to have done much to arrest the spread, and mitigate the severity, of former epidemics."

GENERAL CORRESPONDENCE.

RESULTS OF LITHOTRITY.

LETTER FROM CHARLES WILLIAMS, ESQ.

[To the Editor of the Medical Times and Gazette.]

SIR,—In a late number of the *Medical Times and Gazette* appeared a statistical account of the cases of Lithotripsy performed at Provincial Hospitals, from the year 1854 to 1858. I was surprised to find that only one case was reported to have been performed at this Hospital, whereas during that period eight cases occurred; and I have taken the liberty of sending a short account of each case, so that your table may be somewhat more complete. I may also mention that the case reported, was not lithotomised at this Hospital, but by a Surgeon in Suffolk. I have written to him to ascertain how the case terminated; I have heard it ended in complete recovery; but not feeling satisfied with hear-say information, I wrote to the Surgeon, and expect an answer shortly, which I shall have much pleasure in forwarding to you.

I am, &c. CHARLES WILLIAMS, Resident Surgeon.
Norfolk and Norwich Hospital.

1854.—A man, aged 54, under Mr. Nichols; lithotritised, April 29; cured, May 27. Weight of *débris*, 35 grains.—A man, aged 48, under Mr. Firth; lithotritised, September 1st; cured, October 7. Weight, 57 grains.—A man, aged 45, under Mr. Firth; lithotritised, November 20; cured, December 16; weight, 5½j. and 6 grains.

1855.—A man, aged 27; under Mr. Firth; lithotritised, August 30; cured, September 15; weight, 56 grains.

1856.—A man, aged 35; under Mr. Nichols; lithotritised, August 22; cured, September 6; weight, 5½j. 9j. N.B. This patient had the lateral operation performed on the 4th of May, 1855, and was discharged cured June 30. Weight of the calculus was 3vij. 9iiss.—A man, aged 34; under Mr. Nichols; lithotritised, September 27; cured, October 18; weight, 22 grains.

1857.—A man, aged 66; under Mr. Nichols; lithotritised, April 16; weight of *débris*, 5½j. Lithotomised, May 8, and cured June 6, 1857; weight of calculus, 3iv.—A man, aged 62; under Mr. Cadge; lithotritised, June 13; cured, August 15; weight, 72 grains. N.B. There were two sittings in this case: I cannot find the date of the second sitting.

During the above period (January, 1854, to December, 1858) 56 cases of stone in the bladder were admitted into the Norfolk and Norwich Hospital—47 were lithotomised, 8 were lithotritised, 1 intractable (woman). Total 56.

P.S.—I promised I would let you know the result of the Lithotripsy case, published in your Journal some weeks back, and referred to by me in my last letter to you. The Surgeon says, "George F.—is perfectly free from any symptoms of vesical disease, and he is and has been maintaining himself and wife since the last week in May of this year, having been operated on on the 22nd of January. I removed two calculi of the respective weights of 3iv. and 5iss."

Hoping this information will be acceptable,—I am, &c., C. W.

August 17th, 1859.

DEATH FROM CHLOROFORM.

LETTER FROM W. ALLINGHAM, ESQ.

[To the Editor of the Medical Times and Gazette.]

SIR,—I beg to enclose you my report of the case of death from chloroform which took place at our Hospital last week, and should be obliged by your publishing it, as I see you have given a short notice of the case in your Journal. I am of opinion that these cases should not be considered apart from the whole history of the previous illness, and therefore send you a condensed account.

I am, &c. W. ALLINGHAM,
Surgical Registrar at St. Thomas's Hospital.

R. W., aged 28, admitted into Abraham's Ward, under the care of Mr. Solly. On the morning of June 14, 1859, this patient was carrying on his shoulder a basket containing

bottled beer, and in the endeavour to step from one steamboat to another before they had ceased moving, he got his right foot jammed between them, and was thrown violently forward on to the deck. On his being brought to the Hospital, it was found that he had dislocation of the foot inwards, and the astragalus outwards. The inferior articulating surface and the rounded head of the astragalus could be distinctly felt at the outer side of the foot; the tibia rested on the os calcis; there was no fracture of the ends of the tibia or fibula. There was considerable bruising, and the skin over the dislocated astragalus was very tense. Reduction was readily effected by simple extension. For some days he went on very well, although the foot was much swollen and contused; but he was a man of exceedingly irritable temperament, and had been accustomed to drink freely, being employed in wine-vaults. On the 24th it was evident that sloughing would take place over the outer side of the joint. On the 27th he was attacked with erysipelas, and Mr. Solly made an incision to let out pent-up matter. From this period he suffered very much; several incisions were made at different times, and a slough formed on the inner ankle from slight pressure of the Liston's splint upon which his leg had been placed. He had throughout liberal diet, plenty of stimulants, and opiates at bed-time. The erysipelatos inflammation subsided, and Mr. Solly had him taken up to the operating theatre for the purpose of examining the condition of the joint, and removing the astragalus if necessary. This was on the 23rd of July. He was put under the influence of chloroform by Mr. Gervis, the House-Surgeon, and Mr. Solly carefully examined the joint. He did not find it necessary to remove the astragalus, but gouged away some carious bone. The limb was re-adjusted in a Liston's splint before the patient was taken from the theatre, and the whole operation lasted more than half-an-hour, during which time he was under chloroform.

For a few days after the operation he was better, but he soon relapsed: his sufferings were considerable, no doubt, and much aggravated by his irritability, there was free discharge from three wounds; his rest was broken, his appetite far from good, and Mr. Solly came to the conclusion that it was advisable to amputate the foot. On the 8th of August, the day on which the operation was to take place, he was quite cheerful, and took some stout and brandy, a short time before he was taken up to the operating theatre. Mr. Gervis again administered the chloroform; one drachm was placed in the inhaler, and I should think that not more than half of it had been inhaled when Mr. Gervis found his pulse fail, and withdrew the chloroform; the patient's face became very pale, he made a few gasps, emptied his bladder, and, I believe, then died. An injection of brandy was immediately given, and artificial respiration was continued for full half-an-hour; galvanism was likewise tried without any avail.

I made the *post mortem* examination twenty-three hours after death. Dr. Bristowe, who was in the room making another *post mortem*, kindly gave me the benefit of his valuable opinion upon the points I submitted to him.

General appearances.—Body not at all ill-nourished. Rigor mortis but slight. Some lividity about the ears, face, and neck.

Chest.—Lungs well collapsed. No pleuritic adhesions. There was about a drachm and a half of serum in the pericardium. All the cavities of the heart contained fluid blood, and the heart was perfectly healthy. A microscopic examination failed to detect any fatty degeneration. Both lungs were healthy. There was no odour of chloroform to be detected in them. The aorta was free from atheromatous deposits.

Abdomen.—Liver slightly enlarged (weighing four pounds six and a half ounces), but healthy in structure. The left kidney was twice the size of the right, both were healthy. The spleen was softer than usual, breaking down with the slightest touch. There was no peculiarity about the pancreas. The stomach contained a small quantity of semi-fluid material, and was healthy, as were also the intestines.

Head.—There was a little fluid beneath the arachnoid. The surface of the brain was perhaps slightly paler than usual. On the under surface of the anterior portion of the middle lobe—right hemisphere—there was a depression containing a pulpy material, which Dr. Bristowe suggested to be probably the remains of an old clot—a microscopic examination confirmed this view. There was a similar condition of the under surface of the anterior lobe of the same side, the

olfactory bulb being destroyed. The lateral ventricles contained a small quantity of fluid. There was no other deviation from healthy structure observable.

Examination of the right Ankle.—A sloughy wound existed on the outer side and communicated with the joint—on the inner ankle was another sloughy sore and there was also ulceration on the instep. The astragalus was found to be normally placed with regard to the tibia and fibula; the foot was turned inwards. The cartilage was removed from the upper surface of the astragalus, and softened bone exposed. The opposed articulating surfaces of the os calcis and astragalus were likewise denuded of cartilage. There was no fracture of tibia or fibula.

EXAMINATION AT BED-SIDE OF PATIENT.

LETTER FROM G. E. PAGET, ESQ.

[To the Editor of the Medical Times and Gazette.]

SIR,—In your leading article of last week you mention it as an honour to the Universities of London and St. Andrews; that they have been among the first to institute a Medical examination at the bedside of the patient. Not long ago there was a little controversy in your columns between two graduates of Oxford and London, each claiming for his own University the honour of having originated this mode of examination. As the University of Cambridge has not (as far as I know) been mentioned, it may be as well to say, that the Medical examination at the bedside of the patient was first instituted here.

It was commenced as long ago as the year 1841, in the course of the examination for the *Licentia ad practicandum*, and has been continued in every examination since that time.

I can speak positively, as I was myself the examiner with whom it originated. Dr. Hare, now of University College Hospital, and Dr. Simpson, of Pontefract, were the first, or among the first, who passed the examination.

I am, &c.,

G. E. PAGET.

Cambridge, August 11, 1859.

CASES PROSECUTED UNDER THE MEDICAL ACT.

[To the Editor of the Medical Times and Gazette.]

SIR,—We beg to enclose a report, from the "*Manchester Guardian*" of cases under the Medical Act. The report is very faithful so far as it goes, and will show some questions raised which have not been considered in any previous case; and which prove the Act to be clumsy, and confused. The Act will not effect what it was intended to do; and the attention of the Profession should be directed to its amendment.

We are, &c.

JOSHUA STONE, M.D.,

JONATHAN WILSON, F.R.C.S.,

Honorary Secretaries to the Manchester
Medico-Ethical Association.

84, Bloomsbury, Manchester, August 15, 1858.

At the City Police Court, August 9th, Mr. R. B. B. Cobbett appeared on behalf of the Medico-Ethical Association of Manchester, to prefer two charges for violations of the new Medical Act. As they were the first cases of the kind that had occurred in Manchester, he said the Society did not wish to press for a severe punishment. The first case was that of Mr. Joseph Healey, who occupies the house No. 142, Rochdale-road, upon the door of which are the words, "Mr. Healey, Surgeon." A man, named John Stamford, went to the defendant's house on the 2nd instant, saw the words upon the door, and going in saw Mr. Healey, and asked him to prescribe for his ear. Mr. Healey gave him something in a bottle, for which Stamford paid 6d. The printed book purporting to be the local Register of duly-qualified medical men, and which may be taken as evidence, was then put in. It does not contain the defendant's name. An argument ensued between Mr. Cobbett and the presiding magistrate, Mr. Maude. Mr. Cobbett read the clause which said that "any person who should wilfully and falsely pretend to be and use the name of a Surgeon, or any name implying that

he is registered under the Act, or that he is recognised by law as a Surgeon," &c., shall be liable to a penalty.—Mr. Maude: But does the mere use of the word "Surgeon" imply that? Mr. Cobbett: Unless that is inferred, unless we put that construction upon it, there is no offence.—Mr. Maude: The Act may not effect what it was intended to do. This is a penal Act of Parliament, and any man who uses a term which imports that he is on the Medical register, while he is not on the register, is liable to a penalty. The Act means nothing if it does not mean that. It is singular that it was not said, "No man shall use the term 'Surgeon' except he is a member of the College of Surgeons." You have to raise by implication an offence to which a penalty is attached. You have to assume that the using of the word "Surgeon" is a false pretence within the meaning of the Act, for the Act does not define the word. The case was ultimately adjourned, to afford the magistrates time for consideration, and the decision will be given on Friday.—In the second case Mr. William Andrew was charged with using the word "Apothecary" over his shop window, in Chancery-lane, Ardwick. The fact was not disputed. Mr. Andrew said he was not aware that he was committing any offence. When he took the shop the words "Druggist and Apothecary" were over the door, and he continued them. On his undertaking to remove the latter word, this case was dismissed.

MEDICO-ETHICAL ASSOCIATION.—At the City Police Court, August 12, when the case of this Association against Mr. Joseph Healey, of Rochdale-road (which was adjourned from Tuesday), was called on, Mr. Maude asked the defendant: Upon what authority do you profess to practice at all as a Surgeon?—Mr. Healey: On the authority of my diploma as licentiate accoucheur of the Dublin University.—Mr. Maude: Mr. Cobbett, who was a Surgeon before the Act passed?—Mr. Cobbett: Anybody.—Mr. Maude: That is, there was no law against any person cutting another person's leg off and charging for it.—Mr. Cobbett: None at all.—Mr. Healey: It was the Registrar's fault. He should have intimated to me about this Act; I was not aware of it.—Mr. Maude: The Act contemplates a person "falsely and fraudulently" representing himself to be a Surgeon. After the defendant's statement, will the Society proceed with the case?—Mr. Healey said he should like to know who they were that had brought him to the court, and what authority they had. They had taken away his character in those penny publications.—Mr. Maude said it was perfectly immaterial to the defendant who the persons were who had instituted these proceedings. The question was whether he had committed a violation of the new Act of Parliament. The object of the prosecution was not so much to punish the defendant, as to procure the observance of the Act, by which the public might always know who were really qualified and authorised to act as Medical men, and who were not. If, however, the defendant said if he had committed a breach of the Act it was quite unintentionally, and if he promised to remove the word "Surgeon" from his door, perhaps the Society would be satisfied for the present.—Mr. Healey: Yes, your worship, I shall have "Accoucheur" on the door-plate, and I shall discontinue the word "Surgeon." But can I have "Surgeon" on the window, because it is there now, in gold letters?—Mr. Cobbett, after consulting with the officers of the Society, said: If he would promise to look to the Act of Parliament, and not to use those titles any more, the Society would take no further proceedings, nor press for a conviction.—Mr. Maude: I think it is as well that the Society should withdraw the case; and those persons who persist in using the title "Surgeon" after this, must be prepared to prove that they have a right to it.—The defendant gave the required promise, and this concluded the case.

MEDICAL QUALIFICATIONS.

[To the Editor of the Medical Times and Gazette.]

SIR,—Will any of your readers interpret for me the word "Medicine" in the 31st section of the Medical Act? I am the holder of a qualification which entitles me to practise Surgery in England, and I have registered by virtue of this qualification. I have little doubt, therefore, that I can now practise Surgery in any part of Her Majesty's dominions.

I want, however to practise Medicine as well as Surgery, but I am puzzled to know what is the proper qualification I should endeavour to acquire. If I apply to the College of Physicians I can obtain a qualification to practise Physic, but am precluded by one of their bye-laws from the practice of Pharmacy; and if I go to the Apothecaries' Company, they give me a qualification to practise as an Apothecary. If I graduate at the University of London, I have granted to me a qualification, which authorises me to practise Physic, but not Surgery, Pharmacy, or Midwifery; and if I take a degree at either of the Universities, I may practise Physic. Now, my difficulty is—Which of these is the right qualification for me to get? The Poor-Law Board seem to be in a similar predicament to that in which I find myself placed. They want to know how far the degrees, diplomas, or licences of the several bodies enumerated in their note to the Secretary of the Medical Council, confer the right to practise Medicine or Surgery, or Medicine and Surgery, being like myself without any authoritative information on the subject upon which they can act.

I am, &c.

M.R.C.S.

August 15.

REPORTS OF SOCIETIES.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

TUESDAY, JUNE 28TH, 1859.

F. C. SKEY, Esq., President, in the Chair.

A Paper by WILLIAM TURNER, M.B., Lond., M.R.C.S. was read, on a

CASE OF EXTENSIVE ADHESION OF THE INFERIOR MARGIN OF THE SOFT PALATE TO THE POSTERIOR WALL OF THE FAUCES,

WITH A DESCRIPTION OF THE PARTS SEEN ON DISSECTION.

In this paper the author describes a curious case of palato-pharyngeal adhesion, which came under his notice in the dissecting-rooms of the University of Edinburgh, and to which his attention was directed by his friend, Mr. Paull. Upon looking into the mouth, it was observed that there was a complete absence of the uvula, and that there was no communication between the back of the mouth and the nasal part of the pharynx, except through a small rounded hole situated immediately on the left side of the middle line, and corresponding apparently with the upper part of the arched orifice usually found at the base of the uvula. The separation of the nasal from the buccal parts of the pharynx in this almost complete manner was due to the adhesion of the inferior margin of the soft palate to the interior of the pharyngeal wall. The adhesion had apparently taken place along the folds of mucous membrane containing the palato-pharyngeal muscles. The mucous membrane, especially about the line of junction, presented a roughened and cicatrised appearance. The posterior surface of the pharynx exhibited certain alterations in its walls. It was very much contracted in its lateral diameter, being not more than half an inch across immediately opposite the hamular processes; this contraction corresponded exactly with the line of union of the soft palate to the interior of the pharyngeal wall. The upper part of the pharynx consequently presented a funnel shape. The greater part of the fibres of the superior constrictor muscles had their place occupied by a thickened fibrous membrane; the right stylo-pharyngeus muscle was also greatly altered at its lower part by fibrous thickening. The other pharyngeal muscles, and those portions of the tensores and levatores palati which were situated outside the pharynx, presented their normal appearance. By removing the roof of the nasal part of the pharynx, the interior of this portion of the tube was observed to be shaped like a funnel or inverted cone, the floor being formed of the obliquely inclined soft palate; and at the most depending part, the small rounded aperture of communication with the buccal part of the pharynx was seen. The mucous membrane on the upper surface of the soft palate exhibited the same roughened appearance as on the under. No history of the case could be obtained; but the author

infers that, from the cicatrised appearance of the pharyngeal and palatal mucous membrane, the thickened and roughened condition of the posterior pharyngeal wall, the replacement of muscular fibres by fibrous tissue, and the constriction of the part, that the change from the normal state must have been produced by severe inflammation at some former period. The author then refers to the only two recorded cases of a similar nature he has been able to meet with—one by Rudtorffer, in his "Abhandlung;" the other by Otto, in his "Handbuch der Pathologischen Anatomie." Mr. Turner then draws attention to certain physiological conclusions suggested by the case—1st, the almost complete obstruction to nasal respiration; 2ndly, the impairment of the function of the voice, not only as regards its resonancy, but also with respect to the formation of many of those sounds in the production of which the movements of the soft palate play an important part; 3rdly, to the influence exercised upon deglutition. In connexion with the part played by the soft palate in the function of deglutition, the author, after referring to the observations of Drondi, Müller, and Hilton, directs attention to the recent description by Merkel of the mode of termination of the fibres of the palato-pharyngei muscles in the pharynx. He confirms by his own dissections the description given by that anatomist of the decussation of the lower fibres of those muscles across the middle line posteriorly; but is not disposed to go entirely with him in his views respecting their exclusive termination in this manner. He considers that the muscles end below as follows:—That the external fibres join those of the stylo-pharyngei, and are inserted along with them; that the middle fibres gradually lose themselves in the pharyngeal wall on their own sides and that the internal fibres pass across the middle line posteriorly, and decussate with the muscle on the opposite side.

A paper by Mr. CHARLES HAWKINS, F.R.C.S., was read entitled

SEQUEL OF A CASE (PUBLISHED IN THE LAST VOLUME OF THE "MEDICO-CHIRURGICAL TRANSACTIONS")

OF A CALCULUS IN THE BLADDER REMOVED BY LITHOTRITY,

IN WHICH A COMMUNICATION EXISTED BETWEEN THE BLADDER AND INTESTINE.

The patient, whose case is related in the last volume of the "Medico-Chirurgical Transactions," died on April 19, 1859, a year after the operation. On a post-mortem examination, no stone was discovered in the bladder. The kidneys were somewhat congested, but in other respects healthy in appearance. There was an opening in the bladder at the lower part of the posterior wall, of the diameter of a goose-quill, evidently not of recent date. The bladder, corresponding to this aperture, was intimately united by old adhesions to that part of the circumference of the sigmoid flexure of the colon that lies nearest it. The aperture in the bladder communicated with the sigmoid flexure opposite their point of union. Above the point of communication of these two viscera, for the extent of about an inch, the canal of the sigmoid flexure was somewhat constricted; but this constriction was apparently due to the adhesion and subsequent contraction of these viscera, as beyond the point where adhesion between them existed the calibre of the sigmoid flexure appeared normal. Below the orifice of communication between the bladder and colon, the canal of the intestine was greatly constricted to the extent of an inch and a half in length; this stricture appeared to depend upon great condensation and subsequent cicatrization of the submucous and muscular tissues of the bowel at that point. The mucous membrane of the intestine above the seat of stricture presented in many places pouches varying in size from that of a pea to that of a filbert, and formed by the protrusion of this coat externally. Opposite to the stricture it appeared to be in every respect quite healthy, but very densely convoluted. Below the seat of stricture the bowel was considerably dilated, and had during life apparently acted the part of a second bladder, as, from the symptoms described by the patient, the urine used to accumulate there in considerable quantities, being passed per anum. The post-mortem examination quite bore out the opinion previously advanced by the author.

INFANTICIDE is on the increase in France; in 1851 there were 164 cases reported, whilst in 1857 the number was 203.

PARLIAMENTARY INTELLIGENCE.

HOUSE OF COMMONS.—AUGUST 9TH.

MEDICAL CHARITIES (IRELAND) ACT.

Mr. BRADY gave notice of motion for next session for the appointment of a select committee to inquire into the working of the Medical Charities (Ireland) Act.

HOUSE OF LORDS.—AUGUST 11TH.

MEDICAL ACTS AMENDMENT BILL.

The Earl of BESSBOROUGH moved that the House go into Committee on this Bill.

Viscount DUNGANNON suggested that this Bill should be postponed until the bodies whose interests were affected had an opportunity of considering it.

The LORD CHANCELLOR thought that the Bill ought not to pass without due consideration if it adopted any new principles affecting the *status* or privileges of the Medical corporations.

Earl GRANVILLE doubted whether it would be desirable to give a second reading to the Bill during the present session.

After a few words from the Duke of LEINSTER in support of the Bill, and from LORD KINGSDOWN in favour of postponement, the Bill was withdrawn.

MEDICAL NEWS.

APOTHECARIES' HALL. — Names of gentlemen who passed their examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 11th August:—

BUCKNILL, EBENEZER, Bedford.
FREEMAN, WILLIAM, Maldon, Essex.
GREEN, JOHN, Cawood.
HOLT, WILLIAM, Horbury, near Wakefield.
SMITH, GORDON SIDNEY RICHARD WELLS.
WHITE, ROBERT HENRY, Leeds.
WINTER, WILLIAM THOMAS, Bristol.
WEBB, HENRY JAMES, Chéadle, Staffordshire.

The following gentlemen also on the same day passed their First Examination:—

BELL, JOHN WILLIAM, Hull School of Medicine.
BEDDARD, JAMES, Dudley, Worcestershire.
EGLES, GABRIEL MANNING, Barcombe, Lewes.
LEE, FREDERICK FAWSON, Salisbury.
ORTON, RICHARD, Manor House, Baston, Notts.
PHELPS, FREDERICK PHILIP, Reading.
WARNER, JOHN, Finsbury-square.

DEATHS.

BENNETT.—August 1, at North Shields, William Bennett, Esq., Surgeon, aged 41.

BRETTELL.—On the 10th inst., in London, Joseph Brettell, student at Guy's Hospital, and second son of Mr. John Orme Brettell, of Dudley, in his 21st year.

ELLIS.—August 9, at Cottenham, suddenly, Robert Ellis, Esq., Surgeon, of Willingham, Cambridgeshire, aged 69.

FINDLAY.—On the 13th April, at Boorandara, near Melbourne, John Findlay, Surgeon, R.N., Member of the Legislative Assembly of Victoria.

GUTHRIE.—Mr. Charles Gardiner Guthrie, Surgeon to the Westminster Ophthalmic Hospital, son of the late President of the College of Surgeons, died last Saturday at Clifton, aged 42, of dropsy. Mr. Guthrie's loss is much lamented by a large circle of attached friends.

HARFORD.—May 8, at Turnut, Sydney, New South Wales, of disease of the heart, James Harford, Esq., Surgeon, fourth son of Charles Harford, Esq., late of Bristol, aged 49.

HAWORTH.—August 5, at his residence, Thorney Dikes, Sharples, Thomas Haworth, Esq., M.D., aged 54.

JEWEL.—In May, at Yachandandah, Australia, Frederick Jewel, Esq., M.D., son of the late Samuel Jewel, Esq., Surgeon, of Tregony, Cornwall, aged 35 years.

MACAFEE.—May 16, at Melbourne, of consumption. John P. Macafee, Esq., M.R.C.S. Eng., son of the Rev. Daniel Macafee, of Belfast.

ORNSBY.—August 3, at North Shields, Richard Ornsby, Esq., Surgeon, aged 67.

OWEN.—July 31, at his father's residence, Trefadog, Anglesey, T. O. Owen, Esq., Surgeon, of Corwen, aged 32.

SWANWICK.—August 3, Thomas Swanwick, Esq., of Macclesfield, in his 69th year; M.D. Edinburgh, M.R.C.S. Eng., 1812. He was a Justice of the Peace for the county of Chester, and the borough of Macclesfield.

APPOINTMENTS.

CHARSLEY.—Her Majesty has been pleased to appoint William Parker Charsley, Esq., to be principal Civil Medical Officer for the island of Ceylon, and H. Dickman, Esq., to be Colonial Surgeon at Kandy, in the said island.

JORDAN.—Mr. Furneaux Jordan, professor of Anatomy at Queen's College, has been appointed Assistant-Surgeon to the Queen's Hospital, Birmingham.

MOST rigorous quarantine measures are now in force at Venice, to prevent the entrance of yellow fever from infected ports.

THE INFLUENCE OF THE PUERPERAL CONDITION ON INSANE PERONS.—It results from the very important investigation of M. Marcé, that the puerperal state and accouchement accelerate the progress of insanity.

A WOMAN is reported in the papers to have died of convulsions the other day in London, which were brought on by fright. The fright was caused by the monkey of an Italian organ grinder jumping on her back in an area.

ON Wednesday the Prince of Wales, who visits the University several times a week to receive the instructions of Professor Lyon Playfair, attended, with his Royal brother, a lecture by the Professor on the chymical phenomena connected with the processes of calico printing and dyeing.

ROYAL COLLEGE OF PHYSICIANS.—At a Comitia Majora of the College of Physicians of London, held on the 12 inst. Dr. Markham was elected a Consiliarius in the place of Dr. Roots resigned.

A CURIOUS case of poisoning through the eating of "Potato Bells" is recorded in the journals. The little girl, who ate them on Monday, died on the following Wednesday. We need hardly add, that potatoes belong to the class solanaceæ; and that the "apple" of the plant (as it is called) contains the peculiar poison belonging to this class.

BRITISH ASSOCIATION.—The British Association for the Promotion of Science holds its anniversary meetings this year at Aberdeen. The first meeting will be opened by the Prince Consort, as president of the Society, on September 14; and his Royal Highness has, we understand, expressed his intention of being present during the business of the first two days. Arrangements have been made for holding an exhibition of ancient relics, representative of historical facts and geological remains connected with the north of Scotland; and several concerts are to be given in the new Music-hall which is to be opened on this occasion.

IN CHANCERY.—**JAUNCEY v. KNOWLES.**—The parties in this case are Surgeons, who have been practising in partnership in Birmingham for some time. On the 30th ultimo the Master of the Rolls gave judgment in the suit in favour of the plaintiff, and decreed that the partnership existing between the plaintiff and defendant shall be dissolved from that time, and that Mr. Knowles should refund to Mr. Jauncey half of the premium which Mr. Jauncey had paid to Mr. Knowles.

THE LONDON MEDICAL REGISTRATION ASSOCIATION.—**"The London Medical Registration Association v. Henry Scott."** The defendant, Henry Scott, 17, Adam-street, Strand, was summoned at the Westminster County Court, by Miss Sanders, under the direction of this Association, to recover the sum of £1 ls. paid to him as a fee, he having falsely represented himself to be a Surgeon. Scott, doubtless considering "discretion as the better part of valour," has paid that sum into court, together with the costs.

FALL OF RAIN.—M. Barrall has lately addressed the Academy of Sciences on the subject of the fall of rain during 1858; and among other things informs his learned hearers that the water of the Seine descended last year lower than that it has ever been known to fall; and that the highest level it attained was lower than any of the high levels heretofore noted.

IN reference to the relation between diabetes and cerebral diseases, M. Fritz comes to the following conclusions:—1. Diabetes may be the effect, or the symptoms of certain material lesions, traumatic or other, of the brain. 2. We do not know either the precise seat, or the nature of the lesions which produce true diabetes. 3. Diabetes, consecutive to a traumatic injury of the brain, may arise without any preceding appreciable disturbance of the cerebral functions; but in the majority of cases cerebral disturbance has been observed. 4. The symptoms of diabetes arising from cerebral injury, do not differ from those of ordinary diabetes, but its duration is generally short, and its termination in the majority of cases favourable. 5. The first indication in the treatment of this affection is to modify the state of the nervous centres.

THE Society Médico-Pratique of Paris in 1856 offered a prize of 500 francs for the author of the best memoir on the mode of action of our chief purgatives. They consequently received five memoirs; but regret to say they can't adjudge the prize to any one of them. "One competitor," the report says, "would have had the prize, if his memoir had undergone the revision necessary to make a work *viable*. It is not to the poet alone that Boileau addresses his precept:

'Vingt fois sur le métier remettez votre ouvrage,
Polissez-le sans cesse et le repolissez,
Ajoutez quelquefois et souvent effacez.'

It is particularly to the last line that we recommend the attention of the author in question." However, the said author is to be encouraged by a recompense of 300 francs.

ASCARIDES.—M. Bourgeois d'Etamps asserts that the introduction of mercurial ointment into the rectum has never failed to effect the destruction of these animals in all the numerous cases in which he had tried it. And he adds that it was only in those cases in which other remedies had failed, that he had used it. In the case of a child the mother is directed to introduce into the rectum, as high up as possible, a piece of the ointment on the end of the finger. A grown-up person can do it for himself. All itching, etc., at once ceases; but it is advisable to repeat the introduction three or four times. The small quantity of mercurial substance requisite for the destruction of the animals is really astonishing. No doubt the glysters of M. Legroux, in which the mercurial ointment is held in suspension acts in a similar way, but they are more complicated in use. M. Bourgeois d'Etamps suggests, that at all events if the mercurial ointment is thus used, it might be dissolved in oil, and so injected. Be this as it may, its direct action is so marked as a destroyer of the ascarides, as to place it, in his opinion, above all other remedies.

APOTHECARIES' HALL, LONDON, 1859-60.—**PRELIMINARY EXAMINATION.**—An Examination in Classics and Mathematics for Junior Students will be held in the Hall three times in the year commencing August, 1859, and ending July, 1860; viz. on the third Tuesday and Wednesday in the months of November, 1859, March and July, 1860, at Eleven o'clock. Medical Students cannot be admitted to this Examination before the commencement of their apprenticeship, a certificate of which will be required, but at any period from that date, to the commencement of the Second Winter Session of their Curriculum. This Examination is compulsory to all gentlemen who commenced their apprenticeship after August 1, 1858. The subjects of the current year will be:—*In Greek*, The Gospel of St. John; Third Book of Homer's Iliad. *In Latin*, Cicero, Pro Lege Manilia; Horace, Third Book of the Odes. *Mathematical*, The First Book of Euclid's Elements, Arithmetic, and Algebra, to Simple Equations, involving two unknown quantities. Students wishing to attend are requested to send their name and Address to Mr. Rivers, Beadle's Office, at this Hall, at the latest one calendar month previous to the day of examination.—**ALFRED M. RANDALL**, Secretary to the Court of Examiners.—August, 1859.

THE ABBÉ LACORDAIRE is decidedly the favourite candidate for the Academy of Sciences. If he is elected, and will accept the appointment, he will be the first monk who ever filled one of the forty-two sacred arm-chairs, although the founder of the learned conaculum was a cardinal. From the following account of the Abbé's late proceedings, we may certainly conclude that he is a most fit man to fill a chair in an Academy of Science! The holy man has been for the last four years entirely occupied in the foundation of an institution for the completion of the education of young men before their entrance into the world, and the facilitating to them the choice of a profession. For this purpose he placed himself for a long time under the instruction and guidance of the celebrated ascetic the Curé d'Ars, near Lyons, whose reputation for holiness and ecstatic clairvoyance has attracted so many strangers to the humble village of which he is pastor, that a line of omnibuses from the Croix Rousse direct to the presbytery he inhabits has been established within the last three years. The Abbé Lacordaire has always evinced a tendency towards this kind of ecstatic revelation, and his work on magnetism caused his separation from Rome, which nothing but a journey thither and a personal interview with the Pope could set aside. As Father Lacordaire still cultivates the science with great success, the supposition has arisen that it was not the *illuminé* who was chidden at this interview, but the Pope who was convinced.

NEW MEDICAL FIELD PANNIERS.—The Director-General of the Army Medical Department has authorised the introduction of important improvements in the construction and contents of the Medical field panniers for the use of the army. The Medicines and Surgical instruments have been augmented and modified, to admit remedies and appliances recently adopted and employed in general practice. Each pair of panniers is also provided with a simple contrivance, by which an excellent operating-table may be instantaneously constructed. Another most desirable addition is that of Medical comforts, in the shape of tea and sugar, cocoa-milk, arrowroot, concentrated beef-tea, and brandy, with the means for heating a little water to prepare invalid drinks and diet. It has not infrequently happened during war, that Medical officers have found themselves called upon to attend the wounded when the Medical store cart was following far in the rear, and they had nothing but the panniers to fall back upon—at such times especially the want of an operating-table and Medical comforts was keenly felt. The Director-General has consequently decided, that in future, all panniers supplied to the troops shall be accompanied by these necessary articles. A number of the new Medical panniers are now in course of completion by Messrs. Savory and Moore, 143, New Bond-street, to be held in readiness for immediate use when required.

LLANDISILLO, MONTGOMERYSHIRE.—CONVICTION UNDER THE NEW MEDICAL ACT.—At the petty sessions, on Saturday, August 6, before Sir Baldwin Leighton, Bart., and J. J. Turner, Esq., Mr. Joseph Frederick Eyeley, of Llanymynech, appeared in answer to two informations under the Medical Act of 1858, for falsely pretending to be a Surgeon or General Practitioner. Mr. J. Hawley Edwards, solicitor, of Shrewsbury, appeared in support of the informations, and stated that they were laid by the instructions of the Salopian Medico-Ethical Society, for whom he attended, and that the offence was constituted by the 40th section of the said Act, which he read. He stated that although he had laid two informations, it was not intended to ask for a conviction on more than one, or to ask for more than a nominal penalty, if the defendant would undertake to discontinue practising as a Medical man, to which he had no right, not having any qualification, either as a Surgeon or Apothecary. The Society, moreover, for whom he acted were determined to take proceedings under the new Act, or under the Apothecaries' Act, against all unqualified Practitioners in the counties of Salop and Montgomery. Mr. Edwards then stated the purport of the evidence he intended to call in support of the informations, and proceeded to call Mr. Morris Jones, who deposed that he resided at Llanfyllin, and was Registrar of births and deaths for that district, of which the several parishes of Llanymynech, Llandisililo, and Llandrinio formed part. He produced two certificates of deaths, signed by the defendant, the one relating to the death of one Elizabeth Edwards, in the month of June, 1859, and

the other relating to the death of one Richard Davies, in the month of April, 1859. These certificates were signed, "J. F. Eyeley, Assistant-Surgeon." They were admitted to be in the handwriting of the defendant.—Dr. Jukes Styrac deposed that he was a Physician, practising in Shrewsbury, and appeared on behalf of the Salopian Medico-Ethical Society, of which he was the honorary secretary. He produced the official Medical Register, published on July 1, 1859, and stated that he had examined it and found that the defendant's name was not entered in it. This book was put in as evidence under the 27th section of the Act.—Mr. Edwards stated that that was the case on the first information. Mr. Goodwin, from the office of Messrs. Longueville and Williams, who appeared for the defendant, stated that his answer to the case was that the defendant was practising, not on his own account, but as assistant to a Mr. J. M. Croft, and produced an agreement purporting to be made between him and Mr. Croft, and which he proceeded to read.—Mr. Edwards, in reply, contended that the agreement produced had nothing whatever to do with the case, and pointed out that the Apothecaries' Act expressly prohibited any one from acting as an assistant to an Apothecary, without having obtained a certificate. He contended that it would be absurd to suppose that any properly qualified Medical Practitioner could, by merely taking an unqualified person into partnership, or allowing him the use of his name, thereby authorise him to practise; otherwise he might, by entering into any such agreement with his blacksmith or carpenter, authorise him to practise as a Medical man.—The magistrates considered that the agreement produced on the part of the defendant rather strengthened the case against him, and stated that they felt bound to convict. The defendant was therefore convicted in the nominal penalty of 1s. and 19s. 6d. costs. It was then arranged that the second information should be adjourned till the next Petty Sessions, on Saturday, September 3, it being understood that if, in the meantime, the defendant discontinued his practice, it would not then be proceeded with; otherwise Mr. Edwards intimated his intention to ask the magistrates to inflict the full penalty of £20.

VITAL STATISTICS OF LONDON.

TO CORRESPONDENTS.

Mr. Williams.—Trübner, Paternoster-row.

Medicus.—The period for sending in the Essays for the Caparon Prize of the Académie de Médecine, on Retroversion of the Uterus, has expired.

Fitzjohn.—The subject has been so fully discussed in our columns lately that we can only refer to recent numbers.

Mr. Ellerton.—Mayne's is the most complete Dictionary of Medical terms.

A Young Practitioner.—The case shall be commented on next week.

Owing to great pressure on our space the letter of "A Physician" is unavoidably postponed until our next issue.

Mr. Tiffen.—The degrees named confer the right to practise *medicine*. No licence or degree is necessary to enable anyone to practise *pharmacy*. But no one in England can recover for medicines supplied to his patients in Medical cases unless he have the licence of the Apothecaries' Company. It is very unlikely that the Company would ever proceed against a registered Practitioner.

Mr. H. B.—M. Graefe has seized upon the doctrine of Emboli to explain sudden loss of vision in certain cases of amaurosis. He has not verified the fact of the formation of a clot in the artery in such cases; but he founds his opinion of the fact upon the accompanying symptoms, and examination of the eye by the ophthalmoscope. He relates two cases. In both the amaurosis came on suddenly after hæmatemesis, not immediately, but a few days after. In both cases the disease was incurable. M. Graefe, after discussing the causes which may produce such an affection, concludes that the most probable cause is Embolus of the central artery of the retina.

A Lambeth Doctor.—A Medical witness at the trial of Dr. Smethurst, stated on cross-examination that he was a Doctor of Medicine, created by the Archbishop of Canterbury, but that his degree was not conferred upon him as a matter of course, being a very uncommon thing; that he had to get a certificate from two Fellows of the College of Physicians, stating that they had known him for a length of time, and that he was a proper person to have such degree, that having such a certificate he got the Degree of Doctor of Medicine, but it only enabled him to call himself "Doctor." These doctorates do not now, however, qualify to Register, as the Medical Act of 1858 confines the right to register to the holders of degrees granted prior to the passing of the Act. The Archbishop of Canterbury, it also appears, can make a Master of Arts as well as a Doctor of Medicine.

CARBOLIC ACID.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In your last number, at page 176, your readers will observe that two French gentlemen have just presented to the Academy of France a report of the very discovery which Dr. R. A. Smith, F.R.S., of Manchester, made, and patented in 1854. The carboic acid of coal-tar which is there described is the very principle of Smith and McDougall's disinfectant. Surely you will not allow those French gentlemen to reap the benefit!

In 1857, a solution of carbolate of lime was used with signal effect by several Medical men at St. Mary's, in cases of foul wounds, gangrene, etc. Mr. James Lane has used it frequently at the Lock Hospital for the last three years as a gargle and as a lotion. Its effect is very good in sore throats, and as a purifier of foul breath. In cases of ill-smelling feet, foul linen—in fact, in numberless cases—it has been used by Medical men, and I, as a chemist, have recommended it for the last four years.

I am, &c.

ALBERT J. BERNAYS.

PERIPATETIC SURGERY.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I have just cut the enclosed slip from the advertising sheet of the *Scarborough Gazette*, where it has appeared for two successive weeks. Comment is unnecessary, except to the effect that on reference to the Medical Directory, Mr. Macaulay appears to be Surgeon to the Leicester Infirmary, as well as the holder of several other public offices of importance. Let his colleagues look to the matter.

I am, &c.

TORN AN HONEST PENNY.

Scarborough, August 13, 1859.

"Mr. Macaulay, Surgeon, Leicester, will receive or visit any Patient, who may desire it, during his stay with his family at Scarborough.

"4, Cliff Bridge-terrace, August 2, 1859."

REGISTRATION.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Mr. Jardine has gone out of his way to sneer at Medical men as unable to understand the Medical Act, probably with the desire that some briefless "Barrister of ten years' standing," in default of being able to earn enough by his profession to defray the cost of his wig, should be comfortably saddled on the Medical Council as legal interpreter. We might advance that Acts of Parliament are usually drawn and settled by lawyers—that frequently their clauses are inconsistent with each other—and generally their language is so obscure that even legal minds of the highest order can seldom agree upon their meaning. Unfortunately the Medical Council or Registrar, or both, have most fully justified your remark, that there certainly has been a want of business-like arrangement in the registration; but that does not make the dictum of Mr. Jardine at the first hearing of Mr. Scott's case good law, viz. that Mr. Scott's name not being on the printed Register, it was still incumbent on the prosecution to prove that he had not been registered since that Register was published. The XXVIIIth section of the Medical Act distinctly makes the printed and published Register, "The Medical Register," and says, "A copy of the Register for the time being, purporting to be so printed and published as aforesaid, shall be evidence in all courts and before all justices of the peace and others, that the persons therein specified are registered according to the provisions of this Act; and the absence of the name of any person from such copy shall be evidence until the contrary be made to appear that such person is not registered according to the provisions of this Act." Thus the onus of proving the absence of Mr. Scott's name from the printed published Register, i.e. "The Medical Register," lay on the prosecution. They proved this even to Mr. Jardine's satisfaction, and there and then the case was complete against Mr. Scott, of not being registered, "until the contrary be made to appear." That "contrary" it was for Mr. Scott to make appear if he could, and the last portion of the XXVIIIth section prescribes how it should be done; thus—"In the case of any person whose name does not appear in such copy, a certified copy under the hand of the Registrar of the General Council, or of any Branch Council, of the entry of the name of such person in the General or Local Register shall be evidence that such person is registered under this Act." But he clerk of the Medical Council had deposed, that from the 1st of July

to that date no Register had been kept, though he admitted that persons had been registered as certificates of registration had been given; and this afforded Mr. Jardine the opportunity of asking, "How can a man be registered and receive a certificate that his name was on the Register when no Register was in existence?" This is true enough, and shows gross carelessness on the part of the Registrar, and of course was held to absolve Mr. Scott from the necessity of producing a certificate in accordance with the last part of the XXVIIIth section.

It is of great importance that the practice in these cases should be settled strictly in accordance with the Act, and now that the omission of the Registrar, (or Registrars,) to keep *de die in diem* a complete Register (or Registers) has been rectified, there can be no question, that on the prosecution having proved the absence of the name of the prosecuted person from the last published Register, he would be convicted, unless he could produce the certificate of one of the Registrars of the General or Branch Councils that he had been registered subsequent to the date of that Register. Were it otherwise, in every prosecution it would be necessary to produce not only "The Medical Register," but the "General and Local Registers," as well as the Registrars or Clerks of the General and Branch Councils, as evidence that the person was not registered, there being no provision that the Registrar's certificates of non-registration should be received instead. Such a consequence will hardly be contended for by Mr. Jardine, who, in his anxiety to give Mr. Scott the benefit of any doubt, has been led into a dictum, not necessary to Mr. Scott's defence directly in the teeth of the express provisions of the XXVIIIth section of the Act.

I greatly doubt whether Mr. or "Dr." Scott, notwithstanding the magistrate's interpretation, will tempt another prosecution. Should he afford the opportunity, it must be embraced, or the Medical Act will be nothing better than a legislative *tracasserie*. I am, &c.

August 16.

A. E.

FEES FOR CERTIFICATES OF DEATH.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—As an expedient for doing the right thing to the Medical Profession, for reporting the death, &c., of their patients to the Registrar, I would suggest the insertion of a clause, such as the following, into the Act for Registration of Births, Deaths, and Marriages. "That the Registrar shall pay annually on the first day of January, or on any day for one month thereafter, the sum of Five Pounds sterling, as a fee for certifying according to Schedule (G) of this Act, to every Registered Medical Practitioner within his parish or district, who shall demand the same." I cannot imagine what motive the Legislature could have in "forgetting the fee,"—they usually pay handsomely. Perhaps they felt ashamed to offer a very small sum, and feared a higher one might be looked upon as a bribe, for the Medical attendant to expedite the visit of Her Majesty's loving subjects to the *noir rivage*. The above expedient would obviate both these difficulties, it would I think remove the heart-burnings in the Profession on this matter, which are more due to the feeling of wrong done by the Legislature forcing them to give strictly professional services without remuneration, than ought else. I am, &c. JUSTITIA.

Glasgow, August 4.

PROFESSOR SIMPSON; DR. PAGET, Cambridge; DR. F. HAWKINS; REGISTRAR-GENERAL; DR. SKINNER; REGISTRAR-GENERAL, Edinburgh; DR. LOCKING; DR. SMYTH; MR. HALL; DR. BERNAYS; DR. STONE and MR. WILSON, Manchester; DR. LADD; MR. ECCLES; MR. STOKES; MR. COLIN; MR. HUMPHREYS; MR. FYFE; MR. FALCONY; MR. GROVE; MR. WILLIAMS; DR. JAMES; MR. TIFFEN; MR. GUISE; MR. MCGREEVY; MR. TOMLIN; MR. PRIEST.

APPOINTMENTS FOR THE WEEK.

August 20, Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

22. Monday.

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

23. Tuesday.

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

24. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopædic Hospital, 2 p.m.; Middlesex, 12½ p.m.

25. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; London, 1½ p.m.; Great Northern, 2½ p.m.

26. Friday.

Operations, Westminster Ophthalmic, 1½ p.m.

EXPECTED OPERATIONS.

King's College Hospital.—The following operations will be performed this day (Saturday):—

By Mr. Ferguson—Amputation of Leg; Removal of Dead Bone from Face; Excision of Tonsil. By Mr. Lee—Deformity of Mouth after Burn.

"THE CHEMIST AND DRUGGIST,"

A Monthly Trade Circular,

ENTERED AT STATIONERS' HALL, AND REGISTERED AT THE POST-OFFICE FOR TRANSMISSION ABROAD,

Will be published on the 15th of SEPTEMBER, and continued Monthly. It will consist of about 64 pages 8vo, and will be supplied to the TRADE ONLY for the nominal sum of 2s. 6d. per annum, post free; and will contain Leading Articles, Extracts, Trade Reports, Meetings, &c.; Lists of English and Foreign Patents and Novelties (illustrated when necessary), Correspondence Gazette, Chronology of the Month, and all other matters interesting to the Trade, specially selected and arranged for its columns.

Manufacturers and Wholesale Houses will find this Journal the best medium for bringing their articles before the Trade, no expense being spared in its introduction; in proof of which, a copy of the first Number will be sent to every Chemist at home and abroad where the English language is spoken, and a permanent English and Foreign circulation of Several Thousand per Month is guaranteed.

TARIFF OF CHARGES FOR ADVERTISEMENTS.

Page, 30s. Half Page, 20s. Quarter Page, 12s. 6d. Per Word, 1d.

Employers' and Assistants' Advertisements, not exceeding 24 words, will be inserted for 1s. each; but as we shall circulate 20,000 copies of our first Number gratis, which will entail a very heavy outlay, and be correspondingly advantageous to Advertisers, the charge for insertion will be doubled. This does not refer to Employers' and Assistants' Advertisements.

All Advertisements intended for the first Number must be forwarded at latest by the 1st of September; and for future Numbers, by the 8th of the Current Month.

Communications to be addressed to the EDITOR, 24, BOW-LANE, CANNON-STREET, LONDON, E.C.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 28s. per lb.

The Medicinal value of this Scammony was fully explained at a meeting of the Pharmaceutical Society, and reported at length in their journal of March last, from which the following are extracts:—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with.

"A. B. GARROD, M.D., F.R.S., F.R.C.P.

"Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens.

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs. M'Andrew's scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power.

"GEORGE JOHNSON, M.D., F.R.C.P.

"Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

Wines from the Cape of Good Hope.

W. and A. GILBEY'S SOUTH AFRICAN PORT, SHERRY, &c. &c., 20s. per Dozen. First growths only. Two samples for 12 stamps. Wine Importers and Distillers, 357, Oxford-street, London (W.); 81, Upper Sackville-street, Dublin; and 12, St. Andrew-square, Edinburgh. Medical Reports, Price Lists, &c. sent post free.

Norwich Union Life Insurance Society.

Instituted 1808. Invested Capital exceeding £2,000,000 sterling. This Society is one of the very few purely Mutual Insurance Offices, the whole of the profits being divided among the Policy-holders, and possesses large reserves applicable to future Bonuses.

The rates are considerably below those usually charged. Thus, at the age of 40, the sum of £33 19s. 2d., which, at the ordinary premium, will insure £1000, with the Norwich Union

WILL INSURE ONE THOUSAND AND NINETY-FIVE POUNDS

EIGHT SHILLINGS,

giving an immediate bonus in addition to subsequent accumulations.

Annuities and Special Risks undertaken on favourable terms.

Medical Fees paid by the Office.

For forms of proposal and prospectuses, apply at the Society's Offices, 6, Crescent, New Bridge-street, Blackfriars, E.C., and Surrey-st., Norwich.

Nemo sibi vivat.

Assurances and Annuities granted with the utmost despatch, and on the most favourable terms.

Address for prospectuses, &c. to

FREDERICK BIGG, Actuary and Secretary.

Crosse and Blackwell, Purveyors in

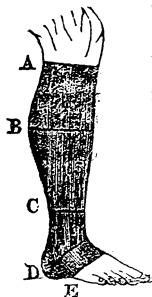

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloaters Pastes, Strasbourg and other Potted Meats, and Calf's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of CROSSE and BLACKWELL, 21, Soho-square.

TRADE  MARK.

SUMMER DIET.

Brown & Polson's Patent Corn Flour.

—This is superior to anything of the kind known—*LANCET*. Obtain it from Family Grocers, or Chemists, who do not substitute inferior articles. It is preferred to the best Arrow Root; for Breakfast boiled simply with milk; Dinner or Supper, in Puddings, warm or cold, Blancmange, Cake, &c., and especially suited to the delicacy of Children and Invalids. Packets, 16 oz. 8d.

Voullion's Patent Elastic SPIRAL SUPPORTS, "WITHOUT SEAMS OR LACING."

200 Leading Members of the Medical Profession recommend them in preference to all others.

DIRECTIONS FOR MEASUREMENT:—

For STOCKINGS—Circumference round the instep, ankle, calf, and above calf.

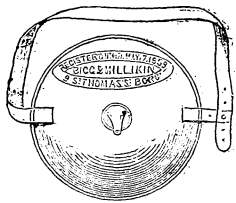

For KNEE-CAPS—Circumference below knee, at knee, and above knee.

For THIGH-PIECE—Circumference round top and bottom of thigh.

For ABDOMINAL SUPPORTS—Circumference of body above and below the hips.

Illustrated and Priced Catalogues free. Prices reduced 30 per cent.

MEACHER, Operative Chemist, sole Manufacturer, 105, Crawford-street, Portman-square.

Registered No. 4171,

May 7th, 1859, by BIGG & MILLIKIN, 9, St. Thomas-street, Borough, MADAME HARRIOTE'S MAMMARY FEEDING BOTTLE, or Artificial Breast, by which an infant can receive its food in the most natural position, and be deceived by its pliable and soft texture. It has many advantages that none but a mother can appreciate.—To be had only at BIGG & MILLIKIN'S, Instrument Makers to Guy's and St. Thomas's Hospitals, 9, St. Thomas-street, Borough.

Great Reduction in the Prices of New

MEDICAL GLASS BOTTLES and PHIALS, at the Islington Glass Bottle Works, Islington-place, Park-road. London Warehouses, 19, Bread-street-hill, near Thames-street, City, E.C., and 2, Upper Copen-hagen-street, Barnsbury-road, Islington. E. and H. HARRIS and CO. Proprietors.

N.B.—Orders sent to either Establishment will have prompt attention.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

"Somerset,

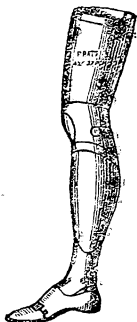

June 20th, 1858.

"DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT IN WEIGHT, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly,

J. W.

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street."

Great Saving in the Purchase of New

MEDICAL GLASS BOTTLES and PHIALS at the NORTH LONDON GLASS BOTTLE WORKS, ISAACS and SON (Proprietors).—London Warehouses, 24 and 25, Francis-st., Tottenham-court-road, W.C.

A remittance not required till the goods are received. Packages free. Delivered free within seven miles. Post-office Orders payable to "S. Isaacs and Son," at Tottenham-court-road. Bankers: Unity Bank.

J. & E. BRADSHAW, late

Shoolbred and Bradshaw, 34, Jermyn-

STREET, begs to call attention to the various improvements in

PATENT ELASTIC STOCKINGS, BELTS, KNEE-CAPS, SOCKS, and Ladies' and Gentlemen's SPINE-SUPPORTERS. A new description of BELT invaluable for prevention of Cholera, and the cure of Rheumatism, Lumbago, &c.

N.B. Every description of INDIA-RUBBER BANDAGE, vulcanized on the newest principle.

Directions for measurement sent by post. N.B. A liberal Discount to the Profession.

A female to attend on Ladies.

Health, Fresh Air, and Pure Water.

—By Her Majesty's Letters Patent.—CONDY'S FLUID contains NASCENT OXYGEN, nature's true and only purifying agent; instantly removes all offensive smells; renders impure water fresh, and the air pure; when diluted for use, is of a beautiful colour, not soiling the finest linen; is harmless, and particularly adapted for toilet use, being both refreshing and exhilarating. The Medical Profession have expressed their unqualified approbation of its merits. One gallon makes 200 gallons adapted for use. The cooling, healing, gently stimulating and invigorating properties of this Fluid render it, when diluted, a lotion possessing peculiar and valuable characteristics, whether for bathing the bodies of invalids, incorporating in poultices, or washing and healing wounds. Patronised by the Board of Health, and most public departments, hospitals, schools, and adopted by the India Council in preference to all other disinfectants. In bottles, 6d. 1s. and 2s.; stronger and purer, 1s. 2s. and 4s.

CONDY'S PATENT HEALTH POWDER also contains NASCENT OXYGEN, is odourless, and destroys all smells; in bottles, 1s. 6d. and 3s., and in casks of 1 cwt. 36s.

Wholesale agents, John Bell and Co. chemists, No. 338, Oxford-st. W. Butler and Crisp, 5, Cheapside, St. Paul's.—Chemical works, Battersea, S.W.

Or SACCHARATED CAPSULES.—Copaiba and Cubebs are, doubtless the best remedies, but these drugs are of a repulsive taste and odour, and occasion colicky pains, nausea, and gastric disturbance. M. JozEAU has succeeded in rendering these valuable therapeutic agents perfectly innocuous, by increasing, in his Copaine, all the curative properties. This preparation has been adopted by the Paris Academy of Medicine, after more than a thousand trials in Paris, and the different London Hospitals, viz., St. Thomas's, Guy's, and St. Bartholomew's, under the care of Messrs. Lloyd, Poland, and Legros Clark. "*Lancet*," Nov. 6, and Dec. 10, 1852: The Copaine, which is in form of a pretty pink sugar-plum, effects a cure in about six days, either in recent or chronic diseases. 100 Capsules, 4s. 6d.: at G. JOZEAU'S, French Chemist, 49, Haymarket, London; 22, Rue St. Quentin, Paris; and all the most important Chemists.

ARTIFICIAL LEGS AND HANDS.

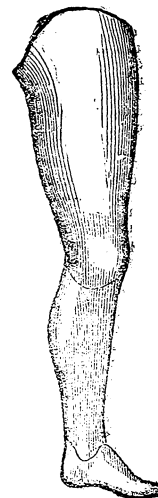

PARIS PRIZE MEDAL, 1855.

GROSSMITH'S NEW ARTIFICIAL LEG,

WITH PATENT ACTION, KNEE AND ANKLE JOINTS,

Enables the patient to walk, sit, or ride with ease and comfort, wherever amputated. It is much lighter and less expensive than the old style of cork leg, will last a lifetime, and is the only leg yet invented that Ladies and Children can wear with safety. It was awarded the highest Medal at the recent Paris Exposition, although more than twenty other makers from different nations exhibited. Can be obtained only at Grossmith's Manufactory, 175, Fleet-street, London (Established 1760); or of Fannin and Co., Dublin, or at Charrieres, Paris.

. Artificial Hands and Arms, Fingers, Eyes, Noses, &c., with all the most recent patent improvements.

Pepsine.—M. Boudault begs to state

that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr. PETER SQUIRE, her Majesty's Chemist, 277, Oxford-street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on "Pepsine," with Remarks by English Physicians. Edited by W. S. SQUIRE, Ph. D., published by J. Churchill, London, may be also had of the Author, 277, Oxford-street, price Sixpence.

To Medical Practitioners. — The

Guardians of the BARNSTAPLE UNION are desirous of engaging the services of a MEDICAL GENTLEMAN (duly qualified), who is willing to undertake the care of the Sick Poor within the Ninth District, comprising the Parishes of Arlington, Bratton Fleming, Loxhore, Marwood, Pilton, and Shirwell, the population of which is 4818, and the Salary £50 a-year: for which the Medical Officer will be required to provide in all cases Attendance and Medicines, and all appliances (except Trusses, which will be provided by Guardians); but he will be allowed, in addition to his Salary, for each case of Midwifery 10s. if the patient resides less than one mile from the Medical officer; 15s. if one mile and less than four; and 41 if four miles or beyond that distance. The Medical Officer will also be appointed Vaccinator, at 2s. 6d. per case. The Duties will commence on the 8th day of September next.

Applications will be received by me up to ten o'clock on Friday morning, the 26th day of August inst., accompanied by Testimonials of qualification and fitness, unless the Applicants have already held a similar office in this Union, in which case all Testimonials will be dispensed with.

By Order of the Board of Guardians,
Barnstaple, August 13, 1859. JOHN BARRY, Clerk.

Westminster Hospital School of

MEDICINE.—The INTRODUCTORY ADDRESS of the Session 1859-60 will be delivered by Dr. RUSSELL REYNOLDS, on MONDAY, the 3rd of October, at 8 p.m.; and after the Address a CONVERSAZIONE will be held, and the PRIZES of the past Session distributed.

The Westminster Hospital was Instituted A.D. 1719, and Incorporated by Act of Parliament A.D. 1836. It contains 175 Beds, and affords relief to about 20,000 Out-patients annually.

HOSPITAL PRACTICE.

Physicians—Dr. Basham, Dr. Fincham, Dr. Radcliffe.
Assistant-Physicians—Dr. Marcet, Dr. Reynolds.
Surgeons—Mr. Barnard Holt, Mr. Brooke, Mr. Holthouse.
Assistant-Surgeons—Mr. Hillman, Mr. Power.
Surgeon-Dentist—Mr. Clendon.

LECTURES.

Descriptive and Surgical Anatomy—Mr. Holthouse.
Practical Anatomy—Mr. Heath and Mr. Gray.
Dental Surgery—Mr. Clendon.
Chemistry—Dr. Marcet, F.R.S.
Surgery—Mr. Barnard Holt, and Mr. Brooke, M.A. F.R.S.
Physiology and Physiological Anatomy—Mr. Power.
Medicine—Dr. Basham.
Botany—Mr. Syme, F.L.S.
Comparative Anatomy and Zoology—Mr. Power.
Natural Philosophy—Mr. Brooke, M.A. F.R.S.
Materia Medica and Therapeutics—Dr. Radcliffe.
Forensic Medicine—Dr. Fincham and Dr. Reynolds.
Practical Chemistry—Dr. Marcet, F.R.S.
Midwifery—Dr. Frederic Bird.

Clinical Lectures.—In addition to the instruction given by all the Medical Officers during their visits, courses of Lectures on Clinical Medicine and Surgery, in accordance with the new regulations of the Examining Boards, will be delivered during the Winter and Summer Terms by the Physicians and Surgeons.

Clinical Assistants, Physicians' Clerks, and Surgeons' Dressers, are selected from the most qualified Students, without additional Fee.

The Entire Course of Study (including Hospital Practice and Lectures) required by the College of Surgeons and the Society of Apothecaries, may be attended on payment of Seventy Guineas.

Further information may be obtained on application to
F. J. WILSON, Secretary to the Hospital.

London Hospital Medical and Surgical

COLLEGE, Mile-end.—1859-60.—The next WINTER SESSION will commence on MONDAY, October 3, 1859, when the INTRODUCTORY LECTURE will be delivered by Mr. CRITCHETT, at Three p.m.

Nicholas Parker, M.D.—Medicine.

Thos. Blizard Curling, F.R.S., George Critchett—Surgery.

John Adams—Descriptive and Surgical Anatomy.

Andrew Clark, M.D.—Physiology and General and Morbid Anatomy.

Practical Histology.

John Sharman, John Cooper—Practical Anatomy.

Henry Letheby, M.B. Lond.—Chemistry; Practical Chemistry.

H. J. Barrett—Anatomy and Pathology of the Teeth and Dental Surgery.

F. H. Ramsbotham, M.D.—Midwifery and Diseases of Women and Children.

F. H. Ramsbotham, M.D., Henry Letheby, M.B. Lond.—Forensic Medicine.

Herbert Davies, M.D.—Materia Medica and General Therapeutics.

George Critchett—Ophthalmic Surgery.

Robert Bentley, F.L.S.—Botany.

J. Langdon H. Down, M.B.—Comparative Anatomy.

General Fee for attendance on the Medical and Surgical Practice, qualifying for the examinations at the London University, Royal College of Surgeons, and Apothecaries' Hall, and for perpetual attendance on all the Lectures, 84 guineas, payable in two instalments of 42 guineas each, at the commencement of the two first Winter Sessions of attendance.

Perpetual Fee to the Lectures alone, £50.

Students can make special entries to Lectures or Hospital Practice.

Further particulars and prospectuses can be had on application to Dr. Parker, Hon. Secretary, 22, Finsbury-square, E.C.; or at the College.

Guy's Hospital.—The Medical Session

commences in OCTOBER. The INTRODUCTORY ADDRESS will be given by Dr. HABERSHON on SATURDAY, the 1st of October, at Two o'clock.

MEDICAL OFFICERS.

Physicians—Thomas Addison, M.D.; G. H. Barlow, M.D.; Owen Rees, M.D., F.R.S.; W. W. Gull, M.D.

Assistant-Physicians—S. O. Habershon, M.D.; S. Wilks, M.D.; F. W. Pavy, M.D.

Surgeons—Edward Cock, Esq.; John Hilton, Esq. F.R.S.; John Birkett, Esq. Assistant-Surgeons—Alfred Poland, Esq.; Cooper Forster, Esq.; T. Bryant, Esq.

Obstetric Physician—Henry Oldham, M.D.

Assistant Obstetric Physician—Braxton Hicks, M.D.

Surgeon-Dentists—T. Bell, Esq. F.R.S.; J. Salter, Esq.

Surgeon of the Eye Infirmary—John F. France, Esq.

LECTURERS.—WINTER SESSION.

Medicine—Owen Rees, M.D. F.R.S.; W. W. Gull, M.D.

Surgery—John Hilton, Esq. F.R.S.; John Birkett, Esq.

Anatomy—Alfred Poland, Esq.; Cooper Forster, Esq.

Physiology—F. W. Pavy, M.D.

Chemistry—Alfred Taylor, M.D. F.R.S.

Demonstrations on Anatomy—Mr. Durham and Mr. Moxon.

Experimental Philosophy—Mr. Durham.

Gentlemen desirous of becoming Students must give satisfactory testimony as to their education and conduct. They are required to pay £40 for the first year, £40 for the second year, and £10 for every succeeding year of attendance, or £100 in one payment entitles a Student to a Perpetual Ticket.

Dressers, Clinical Clerks, Ward Clerks, Obstetric Residents, and Dressers in the Eye Wards, are selected according to merit from those Students who have attended a second year. A Resident House-Surgeon is appointed every six months from those Students who have obtained the College Diploma.

Six Scholarships, varying in value from £25 to £40 each, will be awarded at the close of each Summer Session for general proficiency.

Two Gold Medals will be given by the Treasurer—one for Medicine and one for Surgery.

A Voluntary Examination will take place at entrance, in Elementary Classics, and Mathematics. The three first candidates will receive respectively £25, £20, £15.

Mr. Stocker, Apothecary to Guy's Hospital, will enter Students, and give any further information required.

Guy's Hospital, July, 1859.

St. Bartholomew's Hospital and

MEDICAL COLLEGE.—The WINTER SESSION will commence on OCTOBER 3rd, with an INTRODUCTORY ADDRESS by Mr. HOLDEN, at Seven o'clock p.m.

LECTURES.

Medicine—Dr. Burrows and Dr. Baly.

Surgery—Mr. Lawrence.

Descriptive Anatomy—Mr. Skeay and Mr. Holden.

Physiology and General Anatomy—Mr. Savory.

Chemistry—Dr. Frankland.

Superintendence of Dissections—Mr. Callender and Mr. Smith.

SUMMER SESSION, 1860, Commencing May 1.

Materia Medica—Dr. F. Farre.

Botany—Dr. Kirkc.

Forensic Medicine—Dr. Black.

Midwifery, &c.—Dr. West.

Comparative Anatomy—Mr. M'Whinnie.

Practical Chemistry—Dr. Frankland.

HOSPITAL PRACTICE.—The Hospital contains 650 Beds, and relief is afforded to more than 90,000 Patients annually. The In-patients are visited daily by the Physicians and Surgeons, and Clinical Lectures are delivered—On the Medical Cases, by Dr. Burrows and Dr. Farre; on the Surgical Cases, by Mr. Lawrence, Mr. Stanley, Mr. Lloyd, and Mr. Skeay. The Out-patients are attended daily by the Assistant-Physicians and Assistant-Surgeons.

COLLEGIATE ESTABLISHMENT.—Students can reside within the Hospital Walls, subject to the rules of the collegiate system, established under the direction of the Treasurer and a Committee of Governors of the Hospital. Some of the Teachers and other Gentlemen connected with the Hospital also receive Students to reside with them.

SCHOLARSHIPS, PRIZES, &c.—At the end of the Winter Session, examination will be held for two Scholarships of the value of £45, for the year. The Examination for Prizes and Certificates of Merit will take place at the end of the Winter and Summer Sessions.

Further information may be obtained from Mr. Paget, Mr. Holden, or any of the Medical or Surgical Officers or Lecturers; or at the Anatomical Museum or Library.

Birkenhead Hospital and Dispensary.

—WANTED, for the BIRKENHEAD HOSPITAL and DISPENSARY a HOUSE SURGEON and APOTHECARY, who must devote his services exclusively to the Institution, at a salary of £90 per annum, with Board and Lodging.

No person is eligible who is not a Member of the College of Surgeons of London, Dublin, or Edinburgh, or of the Faculty of the Physicians and Surgeons at Glasgow, and who is not competent to prepare the medicines prescribed by the Honorary Medical Officers. Testimonials of character and qualification to be sent to Mr. W. W. St. George, Clifton Park, Birkenhead, on or before the 10th of September next.

The Candidates will be examined personally and by their testimonials before a Sub-Committee and the Honorary Medical officers of the Institution at the Hospital, on Tuesday, the 13th of September, at six o'clock p.m. and the election will take place by the Committee on the following morning, at half-past nine o'clock. Unmarried parties only need apply, and the Candidates must pay their own expenses.

Birkenhead, August 16, 1859.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars), begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

Obstetrical Society of London.—The

next ORDINARY MEETING will be held on WEDNESDAY, Oct. 5, at 8 p.m.; the President, Dr. RIGBY, in the Chair.

The First Session of the Society will terminate in December, up to which time no Entrance Fee will be demanded. The Council beg to intimate their intention of recommending the Society to require the payment of an Entrance Fee of One Guinea, in addition to the Annual Subscription, by Fellows elected subsequently to this date.

Gentlemen desirous of becoming Fellows are requested to apply to one of the Honorary Secretaries.

By order of the Council,
GRAILY HEWITT,
THOS. H. TANNER, } Hon. Secs.

53, Berners-street.

Operations.—East India, Army and

NAVY EXAMINATIONS.—Mr. CHRISTOPHER HEATH, Demonstrator of Anatomy at the Westminster Hospital (formerly House-Surgeon to King's College Hospital), is prepared to Superintend the Performance of the Operations on the Dead Body. Fee, including an entire subject and the necessary instruments, Six Guineas; or with half a subject, Four Guineas. Apply to Mr. Heath, at the Westminster Hospital.

Radcliffe Infirmary, Oxford.—Wanted

a DISPENSER to this Institution to enter on his duties on the 23rd of September next. Candidates must send to the Secretary on or before September 6th, satisfactory testimonials of their character and fitness. Assistance is allowed for Dispensing on Out-patient days; but no Laboratory-man is kept. The Salary is £40, with Board, Washing, and Lodging.
August 10, 1859. S. TRASH, Secretary.

Dispenser Wanted.—Wanted, for the

COVENTRY PROVIDENT DISPENSARY, a steady, respectable Man, as DISPENSER, who must devote his entire time to the duties of the Institution. A Married Man, without children, preferred. Personal or Freehold Security, to the amount of £100, required. Salary, £70 per annum, with residence, coals, and candles.

Testimonials to be addressed to Edward Bicknell, Esq., Surgeon, Union-street, Coventry, on or before 27th August, 1859.

Royal Infirmary, 180, Waterloo-road.

The Office of HOUSE-SURGEON having become VACANT by the death of Mr. Besly, Gentlemen desirous of becoming Candidates for the Appointment are requested to forward their Testimonials, addressed to the Secretary, at the Infirmary, on or before the 30th inst. The House-Surgeon must be a Member of the Royal College of Surgeons and a Licentiate of the Apothecaries' Company. Particulars relating to the Office may be ascertained by applying at the Institution.
August 3, 1859. G. LUCKIN, Secretary.

Northampton General Lunatic Asylum.

HOUSE-SURGEON WANTED.—NOTICE is hereby given, that a SPECIAL COURT OF DIRECTORS of the above Institution will be holden on WEDNESDAY, the 31st day of AUGUST next, at One o'clock, to APPOINT a HOUSE-SURGEON. Candidates to be Members of the Royal College of Surgeons of England, and Licentiates of the Apothecaries' Company of London; also, not more than 25 years of age, and unmarried. Salary, £100 per annum, with apartments, board, and washing.

Testimonials and Diplomas to be forwarded to the Secretary, on or before the 22nd day of August next.

By order of the Quarterly Court,
JOHN GODFREY, Secretary.
The Asylum, July 20, 1859.

Duffield, Derbyshire.—Four miles from

DERBY.—TO BE SOLD (with possession on the 29th September) A very desirable COPYHOLD MESSUAGE or TENEMENT situate in the main Street of the beautiful and important village of Duffield on the high road from Derby to Matlock. The premises contain ample accommodation for a gentleman's family, with Garden, Vinery, Forcing Houses, and fruit trees in full bearing; Stables, Coach House, &c. The premises have for many years been occupied by a Medical man and contain surgery with private entrance, and would undoubtedly offer a very favourable opening to any Medical gentleman wishing for a highly respectable Country practice. There is a station within three minutes' walk from the house, and railway communications to all parts of the Kingdom. For particulars apply to Messrs. J. and F. Barber & Curry, Solicitors, or Messrs. Moody and Newbold, House Agents, &c. Derby.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Lock Hospital, Westbourne-green,

Harrow-road, W.—At a SPECIAL COURT, held on Thursday, the 11th inst., the following Medical Officers were elected:—Dr. T. KING CHAMBERS, Physician; Mr. J. R. LANE, Surgeon; and Mr. GASCOTEN and Mr. W. J. COULSON, Assistant-Surgeons.

By order, G. T. FRED. ABRAHAM, Secretary.

General Infirmary, Northampton.—

The Office of one of the SURGEONS to this INFIRMARY having become vacant by the resignation of Henry Terry, Esq. Notice is hereby given, that a SPECIAL COURT of GOVERNORS will be held on SATURDAY, the 1st day of October next, at Twelve o'clock, to ELECT a proper PERSON to fill the said office.

Candidates to be Members of the Royal College of Surgeons of London, Edinburgh, or Dublin.

No Surgeon can be elected who does not engage to have his usual residence in the town of Northampton.

Testimonials and Diploma to be forwarded to the Secretary on or before the 24th day of September next.—By order of the Committee,
August 10, 1859. S. P. BENNETT, Secretary.

In-door Assistant Wanted, in a

Provincial Town. A Gentleman possessing the Double Qualification, and duly registered, will be required to assist in Dispensing. Salary, £80 per annum. The most satisfactory references required. Address, Messrs. Corbyn & Co., 300, Holborn, London.

A Good Opening for a Medical Man,

in a Populous Neighbourhood, where he would meet with encouragement and kindness from the respectable portion of the inhabitants, who are desirous of obtaining a Resident Practitioner. Application by letter, addressed G., care of Mr. Robson, 43, Marshall-street, Golden square, will be attended to, and particulars given.

The Son of a Clergyman, aged 23,

desires a SITUATION at the WEST END, in the beginning of October, as an OUT-DOOR ASSISTANT, with the privilege of attending, for an hour or two a day, Hospital Practice. The Advertiser has been actively assisting, during the last year, in a very extensive Practice in the country; has attended part of his Hospital Practice; and is fully competent to Dispense, Visit, and attend Midwifery. Unexceptionable references. Address, stating salary, Y. Z., Dr. Foy, Broughton, Stockbridge, Hants.

To Parents and Guardians.—A Married

Medical Man, residing close to Guy's and St. Thomas's Hospitals, will have VACANCIES, in October next, for ONE or TWO HOSPITAL PUPILS to reside with him. Every advantage afforded for study, and every domestic comfort guaranteed. Terms moderate. Apply by letter, or personally, to M.D., 12, Wellington-street, London-bridge, S.E.

Medical Practice.—To be Disposed of,

for a moderate Premium, the INTRODUCTION to a MEDICAL PRACTICE (with Surgery, &c.), among a large population in WALES, where the late Surgeon (who died 31st ult.) had no competition. A Club, several Mining Companies, &c., are secured; and an Union District will be open, if application is made in time. Some little knowledge of the Welsh language is desirable. Address, Rev. J. M., Dorrington, Wrexeter, Salop.

Asylum for the Imbecile and Insane,

at BENSAM, NEAR NEWCASTLE-ON-TYNE.
Physician and Proprietor Dr. GEORGE ROBINSON.
Resident Physician Dr. DOUGLAS ROBERTSON.
There are now SEVERAL VACANCIES in this Institution, which is pleasantly situated, and commands extensive views of the surrounding country. For terms, &c. apply at the Asylum, or to Dr. Robinson, Newcastle.

PURE SPIRITS FOR THE FACULTY.

S. V. R. 56 o.p., 17s. net Cash.—

This quotation admits of neither credit nor discount, and 1s. per gallon must be added for packages, to be allowed on their return.
HENRY BRETT and CO., Old Furnival's Distillery, Holborn.

TO AUTHORS.

MR. CHURCHILL is preparing his
AUTUMNAL LIST OF ANNOUNCEMENTS OF
NEW WORKS AND NEW EDITIONS
TO BE PUBLISHED DURING THE ENSUING SESSION.
New Burlington-street.

NOTICE.

The Medical Directories for England, SCOTLAND, AND IRELAND.
The ANNUAL CIRCULAR has been posted to every Member of the Profession.
Any Gentleman not having received a Copy is requested at once to communicate with Mr. Churchill.
Office: 11, New Burlington-street, W.

One Vol. 8vo. cloth lettered, price 8s. 6d.

On the Constitutional Treatment of FEMALE DISEASES. By EDWARD RIGBY, M.D., etc.
“We know of no other obstetric writer who so strongly insists on the intimate connexion between uterine and constitutional disorders, or who has carried out this principle so consistently and so successfully. On this account we look upon the work as peculiarly valuable, and calculated to do an immensity of good at the present time, by dispelling the one-sided and narrow views so generally prevalent respecting this class of diseases, and placing their pathology and treatment on a sounder and more rational basis.”—*Dublin Quarterly Journal of Medical Science.*
London: Renshaw, 356, Strand.

NEW EDITION OF SKEY'S OPERATIVE SURGERY.

In crown 8vo, with many Woodcuts, price 12s. 6d. cloth,

The Principles and Practice of OPERATIVE SURGERY. By FREDERIC C. SKEY, F.R.S., Member of the Council of the Court of Examiners of the Royal College of Surgeons of England, Surgeon to St. Bartholomew's Hospital, &c. &c. Second Edition, revised and enlarged.
“We accept it as the candid record of the experience of one of the foremost amongst us—as the work of a man who has thought deeply and independently, and has honestly endeavoured to make the knife—what, indeed, it ever should be—the last resource of the Surgeon.”—*The Lancet.*
“The independence of thought and research which characterises it gives it a peculiar merit, and justifies our recommending it to every earnest student of his profession.”—*British and Foreign Medical Review.*
“There is much sound and wholesome doctrine in Mr. Skey's work—his reputation as a good Surgeon cannot fail to be advanced by it.”—*Medical Times and Gazette.*
“We are glad to see this Second Edition, and can honestly recommend it as an invaluable guide to operative practice.”—*Medical Circular.*
London: Longmans, Brown, Green, and Longman.

Just published, with Eleven Lithographic Plates, 8vo, cloth, 12s.
Notes on the Wounded from the MUTINY IN INDIA: with a Description of the Preparations of Gunshot Injuries contained in the Museum at Fort Pitt. By GEORGE WILLIAMSON, M.D., Staff Surgeon.
John Churchill, New Burlington-street.

Third Edition preparing for publication, with Illustrations,
The Diseases, Injuries, and MALFORMATIONS of the RECTUM. With Remarks on HABITUAL CONSTIPATION.
By T. J. ASHTON, Surgeon to the Blenheim-street Dispensary.
John Churchill, New Burlington-street.

Now ready, price 5s. 6d., or free by post to any part of the United Kingdom, price 6s., Fourth Edition, greatly enlarged and improved,

A Grammatical Introduction to the LONDON PHARMACOPEIA, and a KEY to PHYSICIANS PRESCRIPTIONS. By F. S. LEACH.
“This little work will be found extremely useful to students who have received but an imperfect classical education.”—*The Lancet.*
Hughes and Butler, Medical Booksellers and Publishers, 15, St. Martin's-le-Grand.

DR. LITTLE ON DEFORMITIES.

In 8vo, with 160 Engravings and Diagrams, 15s. cloth,

On the Nature and Treatment of CONTRACTIONS and DEFORMITIES. By W. J. LITTLE, M.D. Senior Physician to the London Hospital, Founder of the Royal Orthopaedic Hospital, &c.

CONTENTS.

1. Deformities in general. Treatment Operative, Instrumental, and Physiological. Forcible Extension under Chloroform.
 2. Contractions from Wounds and Diseases of Joints, Accidents, Rheumatism, &c.
 3. Contractions from Spasm, Paralysis, Burns, Habitual Retention in one Position.
 4. Deformities from Rickets, Weakness, and Curvatures of Bones.
 5. Congenital Distortions and Dislocations, Club-foot, Club-hand, &c.
 6. Congenital Malformations, Monstrosities.
 7. Distortions of the Spine, from Strumous Disease, Rickets, Lateral Curvature, Spasm, and Paralysis.
- Appendix: On Relapsed and Neglected Cases. Index.
“The best treatise on the subject in any language.”—*The Lancet*, the *British and Foreign Medico-Chirurgical Review*, and the *Philadelphia Medical Examiner*.

On CLUB-FOOT and ANALOGOUS DISTORTIONS, including their Treatment both with and without Surgical Operation. 8vo. Forty-one Engravings. 12s.

On ANCHYLOSIS or STIFF JOINT: a Practical Treatise on the Contractions and Deformities resulting from Diseases of the Joints. 8vo. Thirty-two Engravings. 7s. 6d.
London: Longman, Brown, Green, and Longmans.

Third Edition, revised and enlarged, with Illustrations.

DR. KIDD ON ANÆSTHETICS.

On Ether and Chloroform.

By CHARLES KIDD, M.D. (New Work).
"Dr. Kidd will creditably fill the shoes of the late Dr. Snow."—Edinburgh Medical Journal.

Henry Renshaw, 356, Strand.

Dr. Taylor on Poisons.—A long and

searching Review of Dr. Taylor's Work on "POISONS" (Second Edition, lately published) will appear in the CRITIC of the 27th instant. A copy for Five Stamps.

Office, 19, Wellington-street North, Strand, W.C.

The Price of the Medical Register

having been REDUCED, by order of the Medical Council, it may now be had at the Registration Office, 32, Soho-square, W., at 4s. per copy, or post free 4s. 6d.; and every person who has paid 7s. 6d. for the same will be entitled to receive gratis a copy of the Register for 1860.

[ESTABLISHED 1841.]

Medical, Invalid, and General Life

OFFICE, 25, Pall-mall, London.—Empowered by special Act of Parliament.

At the SEVENTEENTH ANNUAL MEETING, held on the 25th November, 1858, it was shown that on the 30th June last.—

The number of Policies in force was 6083

The Amount Insured was £2,551,136 6s. 6d.

The Annual Income was nearly £120,000

The new Policies issued during the last Five years are as follows:—
5411 Policies for £2,599,658, yielding £110,624, in Premiums, showing an average yearly amount of new business of more than

HALF A MILLION STERLING.

The Society has paid claims on 1002 Policies, assuring £426,044, since its establishment in 1841.

Assurances are effected at home or abroad on healthy lives at as moderate rates as the most recent data will allow.

INDIA.—Officers in the Army and civilians proceeding to India, may insure their lives on the most favourable terms, and every possible facility is afforded for the transaction of business in India.

INVALID LIVES assured on scientifically constructed tables based on extensive data, and a reduction in the premium is made when the causes for an increased rate of premium have ceased.

MEDICAL MEN are consulted in every case, and are paid a Guinea for each Report, and receive the same advantages as Solicitors for any business they may introduce.

Policies issued free of stamp-duty, and every charge but the premiums. In the event of death during the days of grace, the risk binding on the Society if premium paid before the days of grace expire.

Every information may be obtained at the chief office, or on application to any of the Society's agents. C. DOUGLAS SINGER, Secretary.

Assurances and Annuities granted with the utmost despatch, and on the most favourable terms.

Address for prospectuses, &c. to

FREDERICK BIGG, Actuary and Secretary.

W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible. Also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atropo, Belladonna, Cotedon Umbilicus, etc.) Also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alternative), Liq. Parietariae (diuretic), and Liq. Belee (prepared from the Ægle Marmelos, of Indian Bael), for dysentery and diarrhoea. W. T. has a large supply of INDIAN BAEL on hand. 2, Edwards-street, Portman-square.

BOUDAULT'S PEPSINE imported in original bottles. *Est. Larici Europ.*

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 28s. per lb.

The Medicinal value of this Scammony was fully explained at a meeting of the Pharmaceutical Society, and reported at length in their journal of March last, from which the following are extracts:—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with.

"A. B. GARROD, M.D., F.R.S., F.R.C.P.

"Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M. Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M. Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens.

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs M. Andrew's scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power.

"GEORGE JOHNSON, M.D., F.R.C.P.

"Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, pervious, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

Blancard's Pills of Unchangeable

IODIDE OF IRON,

Recommended by the Academy of Medicine of Paris, And authorised by the Medical Council of St. Petersburg, Extensively tried in the Hospitals of France, Belgium, Ireland, Turkey, &c. Favouredly noticed at the Universal Exhibition of New York, 1853, and Paris, 1855.

"Of all the modes hitherto proposed of administering iodide of iron in the pure state, I think Mr. Blancard's the best."—Chemistry applied to Therapeutics, by M. Mialhe, Deputy-Professor to the Faculty of Medicine of Paris, Pharmacien to the Emperor, 1856, p. 319.

These Pills stand now very high in the therapeutics of every country, as may be seen by the above quotations, and also by the numerous scientific articles in medical periodicals and works (a).

Being enveloped in a very thin resino-balsamic coating, they present the great advantage of not being liable to any deterioration, of having no taste, of being small, and not distressing the stomach. As they possess the properties both of iodine and iron, they are especially beneficial in chlorotic, scrofulous, tubercular, or cancerous affections, as also in leucorrhœa, amenorrhœa, anæmia, &c. &c., and they furnish the medical man with an excellent means of modifying lymphatic, feeble, and debilitated constitutions. Dose, 2 to 4 pills a day.

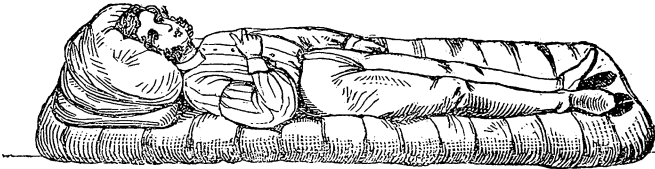

N.B.—Impure or altered Iodide of Iron is an unsafe remedy, and may even prove dangerous. Only such bottles as bear an electro-plated seal fixed to the lower part of the cork, and the signature of the inventor placed on a green label, are to be considered as prepared by Mr. Blancard. The public should beware of spurious imitations.

To be had at M. BLANCARD'S, Pharmacien, Rue Bonaparte, No. 40, Paris. General dépôt in England at M. Gabriel Jozeau's, French chemist, 49, Haymarket, London. In Ireland, at Mr. Vitties, Stevens's Hospital, Dublin. In the United States, at E. and S. Fougere, Chemists, 30, North William-street, New York. To be obtained retail from the principal Chemists.

WATER BEDS.—EDMISTON and SON, 5, Charing-Cross, beg to call

the particular attention of the Managers of Hospitals and Dispensaries, and the Medical Profession generally, to the prices and quality of their Hot or Cold Water Beds. The prices hitherto charged being so high as to limit the sale of such articles to the affluent, they are induced to offer them at such prices as will enable the public generally to realise the advantage and comfort to be derived from their use.

WATER BEDS, £3 13s. 6d., £5 5s., and £6 16s. 6d.

Water Pillows and Cushions, 7s. 6d. to 21s. Urinals, from 3s. 6d. to 12s. 6d. Cotton Elastic Stockings, 4s. 3d. Silk, 5s. 3d. Knee Caps, Leggings, Anklets, &c.

BED SHEETS, ACCOUCHMENT BELTS, &c.

India-Rubber Chamber Utensils for Lunatic Asylums, 7s. 6d. each, or 75s. per dozen.

WATER BEDS ON HIRE. TERMS, 7s. 6d. PER WEEK.

LONDON: EDMISTON AND SON, 5, CHARING-CROSS, LATE 69, STRAND.

Superphosphate of Iron and Super-

PHOSPHATE OF IRON AND LIME. New Remedial Agents introduced to the notice of the Profession at the Meetings of the Medical Society of London, and now extensively employed by the most eminent members of the Medical Profession. The Syrup is the most eligible mode of administering these valuable Remedial Agents. Mr. GREENISH will be happy to forward a variety of cases which have been furnished to him, where its success has been most marked, and which will serve to indicate where it may be most advantageously employed.—20, New-street, Dorset-square.

WINES FROM SOUTH AFRICA.

Denman, Introducer of the South

AFRICAN PORT, SHERRY, &c. 20s. PER DOZEN, BOTTLES INCLUDED. A PINT SAMPLE OF EACH FOR 24 STAMPS.

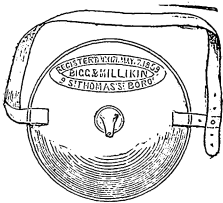

Wine in cask forwarded free to any Railway-station in England.

(Extract from the *Lancet*, July 10, 1858.)

"THE WINES OF SOUTH AFRICA.—We have visited Mr. Denman's stores, selected in all eleven samples of wine, and have subjected them to careful analysis. Our examination has extended to an estimation of their bouquet and flavour, their acidity and sweetness, the amount of wine stone, the strength in alcohol, and particularly to their purity. We have to state, that these wines, though brandied to a much less extent than Sherries, are yet, on the average, nearly as strong; that they are pure, wholesome, and perfectly free from adulteration; indeed, considering the low price at which they are sold, their quality is remarkable."

EXCELSIOR BRANDY, Pale or Brown, 15s. per gallon, or 30s. per dozen. Terms Cash. Country orders must contain a remittance. Cross cheques "Bank of London." Price Lists, with Dr. Hassall's analysis, forwarded on application.

JAMES L. DENMAN, 65, Fenchurch-st., corner of Railway-place, London.

Registered No. 4171,

May 7th, 1859, by BIGG & MILLIKIN, 9, St. Thomas-street, Borough, MADAME HARRIOT'S MAMMARY FEEDING BOTTLE, or Artificial Breast, by which an infant can receive its food in the most natural position, and be deceived by its pliable and soft texture. It has many advantages that none but a mother can appreciate.—To be had only at BIGG & MILLIKIN'S, Instrument Makers to Guy's and St. Thomas's Hospitals, 9, St. Thomas-street, Borough.

TRADE MARK.

SUMMER DIET.

Brown & Polson's Patent Corn Flour.

—This is superior to anything of the kind known—*LANCET*. Obtain it from Family Grocers, or Chemists, who do not substitute inferior articles. It is preferred to the best Arrow Root; for Breakfast boiled simply with milk; Dinner or Supper, in Puddings, warm or cold, Blancmange, Cake, &c., and especially suited to the delicacy of Children and Invalids. Packets, 16 oz. 8d.

Pillischer's Achromatic Microscopes.—

To meet the daily increasing demand for his Microscopes, M. PILLISCHER has recently completed extensive alterations in his workshops to enable him to manufacture MICROSCOPES and their Object Glasses upon a more expeditious and extensive scale. M. P. has the pleasure of informing the Profession that he is now able to furnish Microscopes of the very greatest perfection; possessing every modern improvement; and with Object Glasses of a quality unsurpassed by any other maker, on the shortest notice, and at very moderate prices.

PILLISCHER'S £7 7s. STUDENTS' MICROSCOPE, for which a prize Medal was awarded to him at Paris Exhibition, 1855, deserves particular notice. It consists of a well-constructed Stand, with coarse and fine adjustments, a capital Stage, with Diaphragm and Large Mirror, one Eye-glass, one and one quarter inch Object Glasses, 16° and 75° angular aperture, and a neat Mahogany Case about 7 in. square. The above Microscope when further completed with the addition of a Second Eye-glass, Condenser for Opaque Objects, Live Box, Stage Forceps, large Glass Stage, and Polarising Apparatus, price £10, forms a most complete and valuable Microscope, and in every respect as useful as a much more expensive one.

A Catalogue post free on application to M. Pillischer, Optician, 88, New Bond-street, London, W.

Struve's Seltzer, Marienbad, Vichy,

KISSINGEN, and other MINERAL WATERS.—Under her Majesty's especial Patronage.—ROYAL GERMAN SPA, BRIGHTON, STRUVE'S PUMP-ROOM and PROMENADES, offering every facility for a Course of Mineral Waters, as perfect and beneficial as at the natural springs, are NOW OPEN, for the Thirty-fifth Season. A prospectus, with the highest Medical testimonials, may be obtained gratis, at the Pump-room, or from George Waugh and Co. Chemists to the Queen, 177, Regent-street (west side), London, and other respectable houses in London and the provincial towns, where orders for Struve's Bottled Mineral Waters continue to be executed.

CAUTION.—The success obtained by Struve's Mineral Waters, owing to their perfect identity with those of the natural springs, has induced several parties to attempt imitations, sold as "Brighton Seltzer," "Brighton Vichy," &c., an analysis of some of which has shown an utter disregard of their true chemical composition. To distinguish Struve's Waters from all others, every bottle has a label and red ink stamp over the cork, each bearing Struve's name, without which name none is genuine, though contained in Struve's old bottles.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.

Important Saving, by Prepayment,

in the PURCHASE of NEW WHITE ROUND MOULDED VIALS OF THE BEST QUALITY. PELLATT and Co. submit the following PRICES OF VIALS, for PRE-PAYMENT only:—

Health, Fresh Air, and Pure Water.

—By Her Majesty's Letters Patent.—CONDY'S FLUID contains NASCENT OXYGEN, nature's true and only purifying agent; instantly removes all offensive smells; renders impure water fresh, and the air pure; when diluted for use, is of a beautiful colour, not soiling the finest linen; is harmless, and particularly adapted for toilet use, being both refreshing and exhilarating. The Medical Profession have expressed their unqualified approbation of its merits. One gallon makes 200 gallons adapted for use. The cooling, healing, gently stimulating and invigorating properties of this Fluid render it, when diluted, a lotion possessing peculiar and valuable characteristics, whether for bathing the bodies of invalids, incorporating in poultices, or washing and healing wounds. Patronised by the Board of Health, and most public departments, hospitals, schools, and adopted by the India Council in preference to all other disinfectants. In bottles, 6d. 1s. and 2s.; stronger and purer, 1s. 2s. and 4s.

CONDY'S PATENT HEALTH POWDER also contains NASCENT OXYGEN, is odourless, and destroys all smells; in bottles, 1s. 6d. and 3s., and in casks of 1 cwt. 36s.—Wholesale agents, John Bell and Co. chemists, No. 338, Oxford-st. W.; Butler and Crisp, 5, Cheapside, St. Paul's; Ferris and Co., Bristol.—Chemical Works, Battersea, S.W.

South African Sherry, 19s. 6d. Port,

JAMES MARKWELL, Cellars, 35 to 40 & 45, Albemarle-street—Offices, 40, Albemarle and 4, Stafford Streets. Ports, from 30s.; Sherries, 30s.; Madeira, 42s.; Hocks, 40s.; Moselles, 40s.; Sparkling Hocks and Moselles, 48s.; Ditto, St. Peray, 54s.; Ditto, Burgundy, 60s.; Clarets, 25s.; Chablis, 38s.; Cote Rotie, 48s.; Champagne, 44s.; Sauterne, 40s.; Ditto, Yquem, 80s.; Essence of Turtle Punch, 56s.; Old Tom, 11s. 6d. All kinds of Foreign Spirits and Liqueurs. Particular and direct Shipments of Montilla, Vino di Pasto, Amontillado, Oloroso, Xres Viejo, Manzanilla, Longworth's Sparkling and Dry Catawba American Peach Brandy; Monongahela and Bourbon Whisky; and Sole Agent for the Celebrated Yankee Bitters. Bottled Stock for inspection, 6000 dozen. Cash or Reference. As usual, very liberal prices given for genuine Old Bottled Wines. Half-pints of first-class Champagne only.

N.B.—A considerable quantity of the Old Bottled Wines removed to Mr. M.'s Stock from Long's Hotel, North and South American Coffee House, Shugborough Park, and the celebrated Reading Sale.

ADDITIONAL TESTIMONY ON THE EXTRAORDINARY EFFICACY OF DR. J. COLLIS BROWNE'S

(M.R.C.S.L., Ex-ARMY MEDICAL STAFF)

C H L O R O D Y N E.

(Entered at Stationers' Hall.)

MEDICAL PROPERTIES—Anodyne, Diaphoretic, Sedative, Astringent, Antispasmodic, Diuretic.

From W. R. DAWES, Esq.,
Haddenham.

DEAR SIR,—You should have heard from me sooner respecting the effects of Dr. J. Collis Browne's Chlorodyne, but the fact is, that I have found it so universally applicable as a sedative, that there is great difficulty in making a selection of cases which most strikingly mark its beneficial action without rendering my report inconveniently prolix. I can, however, most truly say, that it is a remedy more generally efficient than any other with which I am acquainted. Its sedative and anodyne effects are not only more speedily produced, but they are also more lasting, and are not followed by exhaustion, or headache, or disturbance of the digestive functions; on the contrary, in many instances its continued use has been followed by exhilaration of spirits and improvement of appetite, especially in the various painful symptoms attending uterine irritation. In hysteria and in dysmenorrhœa, this remedy acts like a charm, as also in nervous headaches and in many cases of cough. In fevers, combined in the early stage with tartarised antimony, it is often of signal service; nor is an increase of dose usually requisite to maintain its beneficial action. In a case of phthisis, the moderate dose of ten minims, taken every night, has sufficed for many months to secure quiet rest, scarcely disturbed by cough, while the omission of it is invariably followed by a restless and coughing night. One fact strikes me as very remarkable—namely, that while the tendency of Chlorodyne to produce constipation is so slight as rarely to require an aperient, it has never failed speedily to stop diarrhoea, or to extinguish attacks of ordinary Cholera. In only two or three instances has it disagreed. The sleep which follows the composing influence of the medicine is peculiarly light and refreshing.

Caution.—Owing to the frequent complaints made by Physicians and General Practitioners of the distress and disappointment caused by the substitution of fraudulent imitations of Dr. J. Collis Browne's Chlorodyne, when prescribed by them for patients, as also vended to them as the genuine (proofs of which are in possession), it is found necessary to adopt the Government Stamp, having the name of Dr. J. Collis Browne's Chlorodyne engraved thereon.

Medical men, Hospitals, and Dispensaries, desirous of obtaining it without stamp, must forward their orders direct, duly authenticated, to the manufactory, when they can be supplied in bulk, a liberal discount being allowed.

Price 3s. per ounce, and in quantity of 10 ounces carriage free.

Sole Agent and Manufacturer—J. T. DAVENPORT, Operative and Pharmaceutical Chemist,
33, GREAT RUSSELL-STREET, BLOOMSBURY-SQUARE, LONDON.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

CAUTION.

Serious and repeated complaints having been made of a discreditable system pursued by many Chemists and Druggists of intrusively recommending or surreptitiously substituting a pale, yellow, or coarse brown preparation, when Dr. DE JONGH'S Oil is prescribed, the Medical Profession are respectfully and earnestly solicited to afford their assistance in counteracting and repressing a practice alike injurious to their patients and to the fair repute of a remedy now held in such high and general estimation. In all cases where this Oil cannot be procured from a respectable Chemist, application should be made to Dr. DE JONGH'S Agents,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

By whom any quantity will be immediately forwarded.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. Mr. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.
16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

THE MEDICAL EVIDENCE IN THE SMETHURST POISONING CASE.

THE first Medical witness examined in this case was on the second day of the trial, after the general circumstances adduced against the prisoner had been brought forward by the prosecution.

Dr. JULIUS, of Richmond, deposed that he attended upon the deceased lady from the 3rd of April until her death. The prisoner first applied to him, and told him that the deceased was suffering from diarrhoea and bilious fever. Witness prescribed for her from that time until her death, and all the medicines were made up by his assistant, Mr. Caudle. He was surprised to find that none of the medicines appeared to produce the effect he expected, and they in no way checked the symptoms exhibited by the deceased, and he at length came to the conclusion that some irritant poison was being administered to the deceased. The prisoner proposed that a certain mixture, which contained prussic acid, gentian, and quinine, should be administered to the deceased, and witness did not think it would do any good; but upon the prisoner saying that he was always there, and that he would watch the effects of the medicine, witness directed the mixture to be made up, and it was administered to the deceased, but did not appear to have any effect. The violent sickness and retching continued unabated, and the deceased complained of burning pains in the mouth and throat and all down the stomach, and that even the act of swallowing caused her to vomit. On the 18th of April other and more serious symptoms exhibited themselves, and the deceased appeared to be fast sinking in strength. None of the medicines that were administered to the deceased produced the effect he expected, and the same symptoms continued after taking every one of them. The witness described the dreadful sufferings of the unhappy lady during the time he attended upon her, and said that, in consequence of the suspicions that were aroused in his mind, he requested his partner, Mr. Bird, to see her, but he did not give him any hint of the suspicion that existed in his mind. Witness was satisfied in his own mind that some irritant poison was being administered to the deceased which entirely counteracted the effects of the medicine that was administered to her, and kept up the symptoms that presented themselves. Mr. Bird attended upon the deceased from the 18th of April to the 21st, and on the latter day witness saw her again, and she then appeared very much worse, and all the old symptoms remained with increased violence. The prisoner suggested that other Medical advice should be called in; and on the 28th of April Dr. Todd came to Richmond, and saw the deceased and prescribed for her, and expressed some opinion in reference to the illness of the deceased. Witness did not make any communication to Dr. Todd relative to the suspicions he entertained. Dr. Todd prescribed a pill composed of a quarter of a grain of sulphate of copper, and the same of opium, and witness had advised previously that the same description of pill should be given, but the prisoner objected to the use of sulphate of copper, as he said it sometimes produced symptoms of poison. The witness also stated that he preserved one of the evacuations of the deceased before the pills prescribed by Dr. Todd had been taken by her. In consequence of what he afterwards heard from Dr. Taylor, the witness stated that he applied to a magistrate, and the prisoner was taken into custody on Monday, the 2nd of May. The witness also proved that he was not even aware of the deceased having been visited by her sister until the 30th of April, and that such a subject was never alluded to, and he was never told that the deceased had made a will. Dr. Julius likewise said that he supposed all along that the prisoner and the deceased were man and wife, and had not the slightest idea that any other connection existed between them, and he concluded by expressing an opinion that small doses of any irritant poison would have produced all the appearances that were presented by the deceased; and that no such ingredients were contained in any of the medicines sent from his dispensary for her during her illness. After the prisoner was in custody upon the present charge he wrote to him for the particulars of all the medicines he had supplied, and he gave him full information of everything that had been prescribed for the deceased.

Vol. XL.—No. 1039.—NEW SERIES, No. 478.

Cross-examined: The prisoner always appeared to make a frank statement of the symptoms exhibited by the deceased during her illness, and he described them correctly according to witness's own observation. To the best of his recollection he was only twice alone with the deceased, but he would not swear that he was not alone with her oftener. It was the prisoner who first suggested that further Medical assistance should be obtained, and witness mentioned the name of his partner, Mr. Bird, who, he told the prisoner, had had great experience in cases of diarrhoea in the Crimea. This occurred on the 18th of April, and at that time witness had formed an opinion that the lady was in a very precarious state, and that his medicines were counteracted by some means or other. He would swear positively that he gave no intimation to Mr. Bird of the unfavourable opinion he entertained before he attended upon the deceased. Dr. Todd came down to Richmond on the 28th April by the quarter to ten train. The prisoner was not aware that he was coming down by this train. He was quite sure that he did not tell Dr. Todd that none of the medicines he had administered had had the slightest effect in repressing the symptoms that were exhibited by the patient. It was a very common practice to administer prussic acid to stop sickness. The medicines witness administered to the deceased were chalk mixture and catechu with compound tincture of camphor, and pills containing two grains of grey powder, and some compound ipecacuanha powder. He also administered quinine, diluted sulphuric acid, diluted prussic acid, chloric ether, and infusion of gentian. This prussic acid was administered under the prisoner's prescription. He never prescribed bismuth, or nitrate of silver, or acetate of lead. Grey powder is a metallic medicine, being a preparation of mercury; and some of the others he had mentioned were also of a metallic character. Witness was present when Dr. Taylor was examined before the magistrates. He never mentioned that the lady was in a state of pregnancy until the last trial. Until the post-mortem examination he had no means of ascertaining the fact, and it would have made no difference in her treatment if he had been aware of it. Vomiting was a very common symptom of pregnancy, and it was also sometimes accompanied by diarrhoea. Witness had never, in his experience, heard of an instance of a pregnant woman suffering from severe vomiting and diarrhoea which would not yield to any ordinary remedies. He had never made a post-mortem examination of the body of a person who had died from arsenic or antimony.

Mr. Sergeant Parry, at the conclusion of the cross-examination, asked the witness if he were a doctor of medicine.

Witness—Yes.

Mr. Sergeant Parry—Is yours a London degree?

Witness—No.

Mr. Sergeant Parry—What degree is it?

Witness—It is the Archbishop of Canterbury's degree.

Mr. Sergeant Parry—What! Can he make a doctor of medicine?

The Lord Chief Baron—Yes; and he can also make a Master of Arts.

Mr. Sergeant Parry—Did you take your degree as a matter of course?

Witness—O, dear no! it is a very uncommon thing. I had to get a certificate from two members of the College of Physicians, stating that they had known me for a length of time, and that I was a proper person to have the degree.

Mr. Sergeant Parry—And having that certificate you got the degree?

Witness—Yes; but it only entitles me to call myself "doctor."

The Lord Chief Baron—But you are a member of the College of Surgeons, and a member of the Society of Apothecaries?

Witness—Yes.

Re-examined—Witness heard of the symptoms of vomiting as early as the 8th of April. At this period the deceased could not have been pregnant longer than a few days, and at that early period witness never heard of pregnancy being accompanied by diarrhoea. The symptoms were also of a totally different character to those generally exhibited by pregnant women. The burning sensation in the throat and soreness of the mouth were quite unusual symptoms connected with the vomiting in cases of pregnancy. The fact of the deceased's pregnancy did not in any way alter his original opinion of the case.

The Lord Chief Baron—Can you account in any other way than you have mentioned for the symptoms that presented themselves in this case?

Dr. Julius—I cannot.

Mr. Bird, of Richmond, partner to Dr. Julius, was the second Medical witness. He stated, that at the request of Dr. Julius, he visited the deceased lady on or about the 18th of April. Dr. Julius did not tell him before he went that he entertained any suspicion in reference to the illness. He saw the prisoner, who told him he thought the deceased had neglected her bowels for some time, and that they were unloading themselves by means of the diarrhœa and vomiting. Witness continued the saline effervescent mixture containing prussic acid, which had been agreed upon by Dr. Julius at the suggestion of the prisoner, for two or three days, and he then changed the treatment. The symptoms of the deceased were not in the least alleviated by any of the medicines that he prescribed, but, on the contrary, they went on increasing in violence. Witness suggested that bismuth should be used, and the prisoner said he thought it was a medicine not likely to do any good. Bismuth in seven-grain doses every four hours made into a mixture with mucilage, was given without good effect. Then four pills were ordered, containing a grain of acetate of lead, and half a grain of opium in each. As these also proved useless, four other pills were ordered, each containing a quarter of a grain of nitrate of silver, made up with crumbs of bread. He was told that one of these pills was afterwards administered to the deceased, and the prisoner said that the nitrate of silver had caused a very injurious effect, and had occasioned a burning pain all through the bowels. The nitrate of silver was certainly not calculated to produce such an effect as he described. After witness had been in attendance upon the deceased for three days, he formed an opinion that something or other was being administered to the deceased which had the effect of counteracting the medicine that was given her, and he communicated this opinion to Dr. Julius. The deceased lady, more than once, in the presence of the prisoner, expressed a wish for further Medical assistance, and it was after this that Dr. Todd was requested to attend. The prisoner subsequently told him that the pill prescribed by Dr. Todd, containing a quarter of a grain of sulphate of copper and a quarter of a grain of opium, had had the effect of causing violent palpitation of the heart, and made it appear to be almost jumping out of the deceased's body. Witness had never before heard of sulphate of copper and opium producing such an effect as this. On the 30th of April he asked the prisoner for a portion of one of the evacuations of the deceased, to be examined, and the prisoner gave him about four ounces, which he placed in a jar and sealed, and he then gave it to his assistant, Mr. Caudle. Another evacuation was afterwards procured, and they were numbered 1 and 2, and were both sent to Mr. Buzzard, of Great Marlborough-street, to be examined and analysed. On Sunday, the 1st of May, witness and Dr. Julius saw Mr. Buzzard, and, in consequence of what he informed them, they applied to Mr. Penrhyn, the magistrate, and he wrote a note to Dr. Taylor, which was given to Mr. Buzzard to take to London. The next day he saw the prisoner at Alma-villas, and he remarked that he thought the deceased was a little better, and he showed him an evacuation, a portion of which witness took away with him, and it was sealed and labelled and numbered 3. The prisoner was taken into custody on Monday, the 2nd of May, and he was admitted to bail on his own recognisance. M'Intyre, the officer, accompanied witness to the prisoner's residence, and he handed him some bottles and pill-boxes that he found there. Witness on this day several times gave the deceased arrowroot and brandy and beef-tea and brandy, and they always remained on the stomach. On the following morning witness was sent for suddenly to the house, and found the deceased sinking and evidently dying, but there were no symptoms of vomiting or diarrhœa.

Mr. Bodkin—To what do you attribute the symptoms you observed?

Witness—I attribute them to some irritant mineral poison given constantly in small doses.

Mr. Bodkin—Would arsenic produce them?

Witness—Yes.

Mr. Bodkin—Would antimony produce them?

Witness—It would.

Mr. Bodkin—When you first formed the opinion as to the

cause of death, were you aware that she was in an incipient state of pregnancy?

Witness—I was not.

Mr. Bodkin—Would that fact alter your judgment in the matter?

Witness—Not in the least.

Mr. Bodkin—Would arsenic have been a proper drug to administer to her in her state?

Witness—Certainly not.

Mr. Bodkin—I believe you have seen many cases of dysentery?

Witness—Yes.

Mr. Bodkin—Taking all the circumstances together, are they referable, in your opinion, to a case of acute dysentery?

Witness—No.

Mr. Bodkin—Or to any other form of disease with which you are acquainted?

Witness—To no form of natural disease.

Cross-examined—Witness had been in practice for five years. All his patients in the Crimea were men. He was never present at a post-mortem examination where the death arose from the administration of arsenic in small doses. Witness had certainly formed the opinion that the deceased was the subject of slow arsenical poisoning, but Dr. Julius first suggested the probability of this being the case. Corrosive sublimate would have produced the same results and symptoms as appeared in this case. Salivation would not necessarily be produced by the administration of corrosive sublimate. The prisoner gave him a regular account of the symptoms of the deceased every day. All the jars that had been sealed up and numbered were eventually sent to Dr. Taylor to be examined. The witness then detailed the particulars of the different medicines that he prescribed for the deceased, and the quantities of the several ingredients of which they were composed. Witness's firm purchased these drugs of Messrs. Hearon and Co. of Bishopsgate-street. The prisoner was particularly anxious that witness should be present at the consultation with Dr. Todd, but he was prevented from doing so by another engagement.

Mr. Sergeant Parry—Have you come to the opinion that the cause of death was an irritant poison, partly from your own observation, and partly from the symptoms described to you from day to day by Dr. Smethurst?

Witness—Yes.

The Lord Chief Baron—Did the symptoms Dr. Smethurst described to you differ from those which you saw yourself?

Witness—Not in the least.

The Lord Chief Baron—Did you see the patient vomit?

Witness—I have done so, and I also had her own account of the vomiting.

The Lord Chief Baron—Did her account differ from that of Dr. Smethurst, or from what you saw yourself?

Witness—Not at all.

The next witness was the Dispensing-Assistant of Drs. Julius and Bird, Mr. CAUDLE, who deposed that he had acted as their dispenser for about a year and a-half, and he had previously studied Medicine. He made up the whole of the medicines that were prescribed for the deceased. He then stated the different ingredients that were used, and also stated positively that there was no arsenic or antimony in any of the medicines that were prepared by him. In one of the prescriptions given by the prisoner, and which contained two drops of prussic acid in each dose, he thought the quantity ordered was very large, and he felt nervous, and reduced the strength. The way he did this was by using the prussic acid of the Pharmacopœia instead of that of Scheele's strength, which the prisoner had ordered. They had none of the latter in the dispensary at the time, but he could easily have procured it, but he preferred using the other, which was weaker. On April 29, in the morning, Dr. Julius brought something to the surgery in a bottle, and gave it to witness, and he locked it up in a cupboard. The next day Mr. Bird brought him another evacuation in a tumbler, and witness placed it in a clean stoppered bottle, and these were both afterwards given to young Mr. Julius to take to Mr. Buzzard. On Monday witness sent the nurse, Chetwood, to Alma-villas, and he took some hydrate of magnesia there for the deceased. Hydrate of magnesia was an antidote for arsenic. There were several preparations of antimony and two solutions of arsenic (Donovan's and Fowler's) in the surgery; but all poisons were kept locked up in a cupboard by themselves, and the

tartar emetic was in a very peculiar bottle, and placed on a high shelf. After the death of the deceased he gave samples of all the ingredients he had used in preparing the different medicines for the deceased, in order that they might be analysed by Dr. Taylor.

Cross-examined—He gave an ample quantity of every ingredient to afford sufficient opportunity for analysis.

After it had been proved that the two sealed bottles containing the evacuations had been delivered to Mr. BUZZARD, of Great Marlborough-street, on Saturday, the 30th of April, that gentleman deposed that he took the bottles to Dr. Taylor on Sunday the 1st of May, who after some hesitation agreed to examine them. The bottle numbered 2 was opened, and a portion of the contents taken out for analysis, and the analysis was carried on in his presence, and he took both bottles back to his own house and locked them up. He then went to Richmond and received a letter addressed to Dr. Taylor by a magistrate, and he returned to London and gave the bottles and the letter to Dr. Taylor.

Mr. R. BARWELL, F.R.C.S., Assistant-Surgeon to the Charing-cross Hospital, then deposed that on the 4th May he made a post-mortem examination of the deceased. He was assisted by Mr. Palmer, of Mortlake, Dr. Julius and Mr. Bird being also present, but taking no part in the examination. There was much congestion posteriorly from position. The face was of a dull earthy colour, very emaciated, and the lips drawn in. The brain was perfectly healthy; the lungs also healthy; both these viscera engorged posteriorly; heart healthy; liver was firm, of full size, and slightly fatty. The peritoneal coat of the stomach and intestines was here and there injected; at the lower part of the ileum there was peritonitis with effused lymph. The uterus and ovaries were removed; the deceased was between the fifth and seventh week of pregnancy. The liver, stomach, intestines, spleen, and other parts, were placed in a jar without having been cut into, and sent to Dr. Taylor. On the following day Mr. Barwell examined them with Dr. Taylor. There was a large black patch of effused blood at the cardiac end of the stomach; rest of the mucous membrane pale, except near pylorus, no ulcers nor perforation; some inflammation at the commencement of duodenum; the other parts of intestines slightly injected; but the lower three feet of ileum, the mucous membrane much thickened by ill-organised granular lymph; that of the cæcum nearly destroyed by inflammation, ulceration, and sloughing; there were many black spots of effused blood; these appearances decreased along colon and rectum. [The witness was interrupted in these details by the illness of the foreman of the jury, who had fainted. After a few minutes the foreman recovered, and the examination of the witness continued.] He said he had heard the evidence as to the symptoms exhibited by the deceased, and taking them together with the post-mortem appearances, he could not reconcile them with any natural disease he was acquainted with; but they were reconcilable with the fact of some irritant having been frequently administered during life.

Cross-examined—Witness had been examined both before the magistrates and the coroner; he had made an erasure in his original notes of the case, but not since those examinations. He had, from the external appearance of the liver, believed it might be in a state of incipient cirrhosis; but this impression was removed on the second inspection, when he cut into that organ. He had not made previously a post-mortem examination in any case where death had resulted from slow poisoning.

Dr. WILKS, Assistant Physician and Demonstrator of Morbid Anatomy at Guy's Hospital, said he was present when Dr. Taylor made an examination of the intestines of the deceased, and he said he agreed with the last witness as to the appearances they presented. He also said that, in his opinion, the death of the deceased was most probably to be accounted for by some irritant, and he was not familiar with any form of disease that would have produced the symptoms that had been spoken of by the different witnesses.

Cross-examined—Severe dysentery would produce great inflammation of the intestines, and also ulceration. Dark spots on the stomach and effusion of blood were also indications of severe dysentery.

Re-examined—Excluding dysentery, witness was not acquainted with any form of disease that would present similar symptoms. He had examined two bodies in which he could not come to any satisfactory conclusion as to the

precise nature of the disease or the cause of death, and they had therefore been ascribed to dysentery. The patients had died very soon after their admission into Hospital, and nothing was known of their history.

The next witness was Dr. TODD, who said:—I was called in to see Miss Bankes, and I went with Dr. Julius. I inquired of him what were the symptoms, and what remedies had been applied. I did not ascertain from him that he entertained a suspicion that irritants were being administered. I did not see the lady until late at night. I examined her in the presence of Dr. Julius and Dr. Smethurst. My attention was first attracted by a remarkable rigidity of the muscles of the abdomen. There was a very peculiar expression of countenance—an expression which I can only describe as an "expression of terror," quite different from what Medical men call "anxiety," an expression I have never seen in any one suffering from any natural disease. The condition of the abdominal muscles suggested the presence of some irritant in the abdomen. I was strongly impressed with the inference that she was suffering from some irritant poison. By my desire an evacuation was obtained. I suggested sulphate of copper and opium pills. I have never known them produce a bad effect upon a patient. I don't think it is possible that they could have produced the symptoms which Dr. Smethurst described. The medicines prescribed by Dr. Julius and Mr. Bird were the proper remedies for diarrhœa, and they certainly would not have produced the symptoms which were said to have attended them by Dr. Smethurst.

Mr. Sergeant Ballantine—You have heard the account of the post-mortem examination and the symptoms—what should you say was the cause of death?

Witness—I believe that she died from the administration of irritant poisons.

Mr. Sergeant Ballantine—What do you include within the term irritant poisons?

Witness—Antimony, arsenic, and corrosive sublimate.

Cross-examined by Mr. Sergeant Parry—I did not actually examine the intestines. I said that, in order to arrive at a correct conclusion, there ought to be a strict examination of the intestines by some one more at leisure than I was. I have never made a post-mortem examination of a person who died from small doses of some irritant poison. Cases of slow poisoning are of very rare occurrence. Excessive vomiting and great diarrhœa may be caused by the early stages of pregnancy, and these symptoms may be somewhat like those under which this poor lady died; but it is quite impossible that pregnancy alone, in the early stage, or in any stage, could produce intense ulceration of the bowels. I have never seen an isolated case of acute dysentery. Dysentery occurs in this country as an epidemic. I never before saw such an expression on the countenance of a patient as I did in the present case. It was not anxiety but terror. I observed Miss Bankes for about ten minutes, but long enough to form a judgment of the case. I asked her very few questions, and she said little to me. I have nothing to do with the branch of the profession known as midwifery.

Re-examined—The only natural disease which would account for the morbid appearances is acute dysentery.

Mr. H. S. PALMER deposed that he was a surgeon at Mortlake. He placed portions of the body and some blood of the deceased in a jar and a bottle to be taken to Dr. Taylor.

There was a break in the Medical evidence here, in order that the Police Inspector might state what took place when the prisoner was apprehended, and prove the results of a search of his person, and the bottles, etc., at the lodgings.

Inspector M'INTYRE deposed that he was stationed at Richmond. He apprehended the prisoner on a warrant on the 2d of May, upon the charge of feloniously administering poison to the deceased, who was at that time alive. The prisoner was taken before a magistrate, and he said that the poor lady might die during his absence, and that it was very essential he should be there. The magistrate allowed him to go at large upon his own recognizances. Witness took from the prisoner some keys and two letters, and he accompanied him and Mr. Bird to the prisoner's lodging, and Mr. Bird gave him several bottles and other things, which he afterwards gave to Dr. Taylor. The prisoner was at large the whole of Monday night, but upon his hearing on the following morning that Miss Bankes was dead, he took the prisoner into custody upon the charge of wilful murder. After the prisoner was in

custody he searched his lodgings, and found some other bottles, which he also gave to Dr. Taylor. He subsequently went to Rifle-terrace, where he found a lady who was called Mrs. Smethurst, and in consequence of what she told him he made certain inquiries at Kennington Church.

Cross-examined—The whole of the bottles he took away he afterwards handed to Dr. Taylor. When the magistrates admitted the prisoner, they suggested that he should not interfere with the lady any more.

Mr. BUZZARD was then recalled. He said he acted as staff-surgeon to the army during the late Crimean war, and a great many cases of bowel complaints came under his observation at that period. He had heard the description given of the deceased's symptoms, and the appearance of her body upon the post-mortem examination, and he knew of no form of dysentery or bowel complaint reconcilable with those symptoms and appearances. He should refer these symptoms to some irritant substance being taken into the system, either by the mouth or by injection. Witness was present when Dr. Taylor began to analyse a portion of the contents of the bottle No. 2. He did so by what was called Reinsch's test, and Dr. Taylor showed him the copper that was used for the test was coated with a dark grey substance. Upon this discovery being made, witness at once proceeded to Richmond, and made a communication to Dr. Julius and Mr. Bird.

Cross-examined—Witness had never in his life attended a patient who died from slow arsenical poisoning. The only test Dr. Taylor used was that known as Reinsch's, by which, where arsenic is present in any substance, it is deposited on copper wire or gauze.

Dr. METCALFE BARINGTON—I am a Fellow of the College of Physicians. About eighteen years ago I saw six or eight cases of acute dysentery. They were of an epidemic character, and occurred in Lower Chelsea. In 1847 I saw two other cases in the same neighbourhood. I have heard the symptoms described to-day, as well as the appearance which the body presented after death. Taking all those circumstances into consideration, I do not think she died from acute dysentery. I should think she died from the effect of irritant poisons. I have had an extensive Medical practice as an accoucheur, and have delivered more than 2000 women.

Cross-examined—I have known cases of pregnancy in which there was violent vomiting, but not violent diarrhoea, as an urgent symptom in the first weeks of pregnancy. I do not know of a case in which in the early stages of pregnancy life has only been saved by having recourse to abortion. In the early stages of pregnancy violent retching is common, but it is not an unfavourable symptom.

Re-examined—This case differs from the six cases of dysentery I have mentioned, in this—that there was not the same destruction of the mucous membrane.

Dr. LEWIS BOWERBANK—I was twenty-three years in Jamaica, practising as a Medical man. Acute dysentery is a common disease in that country, and I have had much experience of it. The symptoms and appearances in this case are certainly not referrible to any form of acute dysentery. Some of the symptoms may be traceable to acute inflammation of the intestines. There is no natural form of disease to which I can attribute the symptoms and appearances. I should say the symptoms are those of irritant poison.

Cross-examined—Dysentery is much more frequent in tropical climates. I have only been in England since my return from Jamaica six months. My experience of dysentery in Jamaica extended to the white as well as the coloured population.

Dr. COPLAND—I am a Fellow of the College of Physicians, and the author of many Medical works. I was in Africa in 1817, and then saw many cases of acute dysentery. Soon after the peace in 1815 I saw cases of acute dysentery on the Continent. I witnessed the post-mortem examination of many bodies. I have practised in England many years. In my opinion, viewing the whole evidence in this case, the death of the deceased is not referrible to any form of acute dysentery. In my opinion, it is referrible to irritant poisons, administered either by the mouth or by injection, or by both, at intervals and in small quantities.

Cross-examined—I should expect in a case of slow poison by arsenic to find a certain amount of arsenic in some of the tissues of the body. I should not expect to find much where there was continual vomiting and purging.

The evidence of Dr. TAYLOR was next heard—on the morning of the third day of the trial.

Dr. ALFRED SWAINE TAYLOR, examined by Mr. Bodkin, said—I am Professor of Chemistry at Guy's Hospital; I am also a Fellow of the College of Physicians and a Member of the College of Surgeons, and I have had considerable experience in cases of this description. On Sunday, the 1st of May, Mr. Buzzard called on me at my private residence. He brought with him a parcel wrapped in paper, containing two bottles. I only examined bottle No. 2. It was sealed with a Turkish seal (Mr. Bird's seal). In consequence of a communication made to me by Mr. Buzzard, I undertook to test the contents of one of the bottles. There was no selection made. He opened the parcel, and took the bottle which seemed to come first. Two drachms of the contents of bottle No. 2 were poured out. I tested my apparatus in the first instance. It consisted of copper wire, muriatic acid, distilled water, and an ordinary test tube. The acid and water were boiled, and a piece of copper wire placed in the mixture. I tested the vessels which I used. I then used the same acid and water, and the same wire and tube, in testing the liquid of No. 2. I found a metallic deposit upon the copper wire of a grey, steel colour. That indicated to me that arsenic or antimony was present, but I could not say distinctly what metal, or whether there might not be mercury. I did not proceed further with my experiment at that time. I desired Mr. Bird to get the authority of a magistrate. Bottle No. 2 was re-sealed in my presence by Mr. Buzzard, and it was taken away by him. He also took away bottle No. 1. Application was made to me to make the experiments without delay, as they might be the means of saving the life of the lady; and although it is not my practice to do so on Sunday, I continued the experiments as soon as Mr. Buzzard had left. I tested the same liquid further by boiling some copper gauze in it. I then examined the copper under the microscope, and I saw upon it an appearance closely resembling an arsenical deposit. In the evening of the same day I heated a portion of the coated gauze in a tube, and obtained crystals which I had no doubt were arsenic. Here is the tube (holding up a small glass tube, which the Chief Baron examined). I afterwards ascertained by other tests that they really were crystals of arsenic. On the evening of the same day Mr. Buzzard brought back a letter and the two bottles to my house. Next morning I proceeded to finish the examination of bottle No. 2, and, having taken two ounces of the liquid, I by the same process thoroughly satisfied myself that it contained arsenic. I employed Reinsch's process, and got the result on a larger scale. I calculated that there was less than a quarter of a grain of arsenic in four ounces of evacuation (about one-sixth of a grain). I endeavoured to ascertain whether the arsenic was in a state of solution, and I found that it was. I found it in a dissolved state mixed with blood. On a subsequent analysis I found copper, but only a mere trace of it—just enough to enable me to say that there was copper. I found no indication of antimony, mercury, or bismuth.

The Lord Chief Baron said it appeared that a copper pill was given to the patient on the 29th of April, and that evacuation No. 2 was obtained on the following day.

Mr. Bodkin—If there had been antimony, mercury, or bismuth, would you have discovered it?

Witness—Yes; it is the great feature of the process I used that it is the only one which enables chemists to ascertain at once whether any of those metals are present. I examined the organic matter of No. 2, and found it consisted of fibrous and feculent matter mixed with bile and blood. Having discovered arsenic in the blood, I immediately came to the conclusion that it was the evacuation of a person suffering from the administration of arsenic. I found no arsenic or metallic substance in the other bottle. It consisted merely of feculent matter, mixed with mucus and blood, and was of a greenish yellow colour. On the 5th of May I received a parcel from Inspector M'Intyre, containing a jar. I found in the jar a portion of the viscera, the stomach unopened, the spleen, the large and small intestines, as well as the liver, the gullet and the uterus. On the 7th of May I received a bottle containing the kidneys, and a small bottle containing blood, said to have been obtained from the heart. I also received a number of bottles from M'Intyre—about thirty in all. I examined the contents of all those bottles.

I examined the uterus, and I concur in all Mr. Barwell said respecting it. It was in a pregnant state. I then examined the gullet, the vessels of which were injected, indicating some cause of irritation. The stomach contained a brownish fluid. I found no arsenic or antimony in the stomach. On an analysis I found antimony in the small intestines in two distinct places. The middle part of the small intestines contained the largest quantity. There was some above and below. I also found some antimony subsequently in the cæcum and in one of the kidneys. The other kidney was not examined. There were traces of antimony in the blood of the heart, as well as in the liquid in the jar. I found none anywhere else. I was assisted by Dr. Odling. We calculated that the whole quantity of antimony found did not exceed from a quarter to half a grain. I found a remarkable appearance in the cæcum. It was much ulcerated, and the lining membrane nearly destroyed throughout. The large intestines were ulcerated more or less throughout. There were patches on the rectum, but the most remarkable appearance was the almost entire destruction of the lining membrane by ulceration. There was some blood in the stomach, and it must have been brought there by some great causes of irritation. There was no appearance in the other organs to account for death. I next examined the contents of some pill-boxes which I received from M^cIntyre. I found they were what they were represented to be. There were some copper pills, one of which was taken for analysis. They contained sulphate of copper with powdered opium. (These pills were prescribed by Dr. Todd.) In the glass piston of an enema syringe I found some cotton, which contained a white metal, either mercury, silver, or bismuth. There were two bottles of bismuth mixture; one was quite full. From the other about an ounce and a-half had been taken. I found prussic acid and sulphuric acid in other bottles. The bottles corresponded with their inscription. I found some sugar and tapioca, but I discovered nothing in them. I examined bottle No. 5. I produce it. It contained 355 grains of chlorate of potash. It is a salt which was used for percussion caps, and is employed for explosive mixtures. I also produce bottle No. 21. It corresponded with another containing quinine mixture. It was about half full of a clear watery liquid of a saline taste. I tested half of it by Reinsch's process, as I had done with the other bottles. I found that the copper I introduced into it was instantly destroyed. This seemed to me a remarkable occurrence. I had never seen it before in my experience in searching for arsenic. I then plunged in some copper gauze, and on removing it after a short time I examined it, and obtained crystals of arsenic. I then put the bottle aside, and went on with my other experiments. As this was something remarkable, I was anxious to have the assistance of another chemist. At first Dr. Odling, who assisted me, and myself were led to suppose that there was arsenic in the liquid, but from experiments subsequently made we both came to the conclusion that there was no arsenic nor any antimony in the liquid. We found that the arsenic had come from the copper gauze. The copper gauze being dissolved, it set free some arsenic which was contained in the copper. Chlorate of potash is a cooling medicine, and moderately diuretic. The effect of the experiment might have been relied upon if the liquid had not dissolved and destroyed the copper. Chlorate of potash might so act on the kidneys as to aid in carrying off any irritant matter.

Mr. Bodkin—Have you heard the evidence as to the symptoms which the deceased lady exhibited, and as to the appearances on the post-mortem examination?

Witness—Yes.

Mr. Bodkin—Taking all the circumstances into your consideration, to what do you attribute her death?

Witness—I can ascribe her death to nothing but the action of irritant poison.

Cross-examined by Mr. Sergeant Parry—I was examined in this case before the magistrate and the coroner; twice before the magistrate, and once before the coroner. I found traces of arsenic in bottle No. 2—about the sixth part of a grain. The copper gauze I used was the same kind of copper gauze which I employed with bottle No. 21. I unknowingly deposited arsenic with the copper gauze when I placed it in bottle No. 21, but that was owing to the chlorate of potash dissolving the copper. Dr. Odling made an independent experiment with bottle No. 21, and arrived as I had done in the first instance at the conclusion that arsenic was present. Besides

Reinsch's process, I employed Marsh's process. When I made the experiment I was not aware that chlorate of potash was present. I had to find that out.

Mr. Sergeant Parry—Did you solemnly before the magistrate and the coroner state, more than once, that you had discovered arsenic in bottle No. 21?

Witness—Yes; that was my belief at the time.

Mr. Sergeant Parry—Did you not say before the magistrate, "Understand, sir, I tested all my tests before I made this discovery of arsenic?"

Witness—Yes; I had tested them in the usual way. I have used the same copper gauze for fourteen years without arsenic being produced from it in the way I have described.

Mr. Sergeant Parry—You have used it in other cases before?

Witness—Yes.

The depositions of the witness before the magistrate at Richmond on the 20th of May, and also before the coroner on the 25th of May, were read.

Cross-examination continued—At the time I made those statements I firmly believed that the arsenic I discovered in bottle No. 2 was placed there by somebody else, and not by my tests.

The witness's depositions before the magistrate on the 5th of May was here read by the learned judge.

Mr. Sergeant Parry, continuing the cross-examination, asked the witness—When did you find out that you had made, what you now frankly confess to be a blunder?

Witness—I finally came to the conclusion that the arsenic was to be attributed to the copper about the 7th of June.

Cross-examination continued—Acid in the stomach might to a very limited extent dissolve copper. My tests have on former occasions been disputed.

Mr. Sergeant Parry—Do you remember any occasion when you conscientiously believed that your tests were correct, and when they were found not to be so on further examination?

Witness—Never.

Mr. Sergeant Parry—As a general rule, in cases of slow arsenical poisoning, should you expect to find arsenic in the tissues?

Witness—Yes.

Mr. Sergeant Parry—Did you not say to Mr. Buzzard, when the lady was living, that she was suffering from arsenic, and that it was being carried off from her body?

Witness—Yes, I said so.

Mr. Sergeant Parry—After you found arsenic in bottle No. 21, did you not come to the conclusion that the arsenic in the body was carried off by the chlorate of potash?

Witness—I was asked by Mr. Sergeant Ballantine what would be the effect of chlorate of potash, and I said it would tend to carry off through the kidneys any mineral or foreign matter.

Mr. Sergeant Parry—I ask you, when you discovered the arsenic in bottle No. 21, whether you did not form the theory, to account for the absence of arsenic in the body, that it was carried off by the chlorate of potash?

Witness—No; I merely said what the effect of that diuretic would be. I went down to Durham at the request of the Government to give evidence in the case of Mr. Wooler, who was charged with the murder of his wife by slow poisoning in 1855. I made myself master of all the details in that case. There was no question as to the poison having been administered, the only question being by whom it was administered. Arsenic was found in the tissues of the lady's body, and also in the liver. Arsenic was discovered in all parts of the body. I found one grain, and Dr. Richardson, of Durham, found half a grain. I admit the liver is the great criterion as a seat of deposit in a case of poisoning.

The witness was then cross-examined as to the appearances which would be presented from poisoning by arsenic and antimony.

Re-examined—I have used the same copper gauze I employed here in 77 analyses in this case, and in 76 no arsenic was produced by it, the exception being in the chlorate of potash liquid.

By the Lord Chief Baron—The test by means of the copper gauze has always been effectual where it has not been destroyed by chlorate of potash.

By Mr. Sergeant Parry—Arsenic is sometimes found in bismuth. There was no mineral matter in evacuation No. 3.

Mr. PALMER recalled, and examined by Mr. Sergeant Parry

—I made the post-mortem examination with Mr. Barwell. I found the liver enlarged, hardened, and in an incipient state of fatty degeneration. I found it very much hardened in the left lobe. That might be the effect of continued bilious irritation.

By Mr. Sergeant Parry—I merely judged from the external appearance. I did not see the liver opened.

Dr. ODLING, Professor of Practical Chemistry at Guy's Hospital, proved that he assisted in analysing a portion of the intestines of the deceased, and he agreed in the statement made by Dr. Taylor as to their condition, and said he was satisfied that there was antimony in the body. He then gave the same account of what took place with reference to the examination of the bottle containing the chlorate of potash.

By the Judge—Unless the copper is dissolved, Reinsch's test is infallible in the discovery of arsenic, and is the best.

By Mr. Sergeant Ballantine—I agree with the observations that the death of the deceased arose from the administration of some irritant poison, and I do not know of any disease that would account for the symptoms that have been spoken to.

Professor BRANDE—I was formerly Professor of Chemistry at the Royal Institution, and have been engaged in analytical researches for fifty years. I examined a portion of the liquid of No. 21 given to me by Dr. Taylor. I examined one portion of it by Reinsch's process, and another portion by Marsh's process. I found no arsenic. The chlorate of potash had been removed. Chlorate of potash dissolves copper, but that fact would not affect my opinion as to the safety of Reinsch's process, where chlorate of potash is not present. When the matter does not contain any substance which dissolves copper, the test is in all respects an admirable one. In my judgment the test was properly applied in the present instance to the tissues of the body and to the evacuations. In my opinion the result obtained is correct.

By the Court—The condition of the copper was not supposed, until this occurrence took place, to have any effect upon the test, and if I had made the experiment at the time Dr. Taylor did, I should have come to the same conclusion, that there was arsenic contained in the liquid of No. 21.

Dr. JULIUS was then recalled, and said he heard the statement made by the prisoner before the magistrate when he was charged with attempting to poison. The prisoner said it was very necessary he should go to his wife—that her death might be occasioned by his absence, and that it was imperative he should go. He also said that everything had been administered to her by himself, and that if any metallic substance had been administered, it must have been in the medicine.

Mr. Sergeant Parry—Did the magistrates request him not to interfere with the patient?

Witness—I don't think that observation was addressed to him. It was said generally, but in his presence, and he might have heard it.

This completed the Medical evidence for the prosecution. That for the defence was begun late in the afternoon, immediately after the address to the jury made by Sergeant Parry, the counsel for the prisoner, had been concluded. The first witness called was

Dr. B. W. RICHARDSON, who deposed that he was a doctor of medicine, a Licentiate of the College of Physicians, and Professor of Physiology at the Grosvenor-place School. He had heard the evidence as to the symptoms of the deceased, and in his opinion they were not reconcileable with a case of slow arsenical poisoning. There was an absence of several symptoms he should expect to find in such a case. There was no inflammation of the conjunctivæ or nostrils, no excoriation about the lips or anus, or orifices of any of the mucous canals, no *eczema arsenicale*, and no specific nervous symptoms. The result of the post-mortem examination, in his opinion, also was not consistent with a case of poisoning of that description, as the inflammation appeared to be more developed in that portion of the intestines which in cases of poisoning by arsenic generally received the least injury. He should also certainly expect in a case of poisoning by arsenic that arsenic would be found in the tissues of the body. He had tried some experiments with arsenic administered in small doses upon a dog, in conjunction with large doses of chlorate of potash, and after the dog was destroyed he discovered

arsenic in the liver, lungs, heart, and spleen of the animal. He administered a large quantity of chlorate of potash with the arsenic, in order to see whether it had the effect of eliminating the poison.

The Lord Chief Baron—How much arsenic do you say you administered to the animal?

Witness—18 grains, and 365 grains of the chlorate, in 16 days.

The Lord Chief Baron—And how much remained in the body, or how much did you find?

Witness—I cannot say.

The Lord Chief Baron—Surely you can tell us whether there was a grain or half a grain?

Witness—I don't think there was so much as a grain discovered. There might have been half a grain.

The Lord Chief Baron—Out of the whole 18 grains that you administered?

Witness—I cannot absolutely say that I detected more than that in my analysis; but I only analysed a small portion of the body.

By Mr. GIFFARD—Witness tried experiments upon two other dogs, with antimony and arsenic given alternately, one in conjunction with chlorate of potash, and the other without. One of these dogs died at the expiration of eleven and the other of twelve days, and in both cases a portion of the poison passed away in the urine, but he could not say how much. In both cases the symptoms, the pathology, and the discovery of the amount of arsenic in the tissues were identical. In cases of slow poisoning by antimony he should expect to find a softening of the liver and congestion of the lungs. He should also expect to find some of the poison in the liver after death. The liver was generally the great depot for arsenic and antimony. He had seen a great many cases of acute and ordinary dysentery, and it appeared to him that the symptoms exhibited by the deceased more resembled those of the former malady than the result of slow arsenical or antimonial poisoning. He had seen in cases of pregnancy that the patient suffered from vomiting and diarrhoea. From the description that had been given of the deceased lady, he considered she was a very likely subject for dysentery. He had analysed bismuth as it was ordinarily obtained, and he had discovered the presence of arsenic in every instance. The largest quantity he discovered was half-a-grain of arsenic in an ounce of bismuth. There were 480 grains in an ounce. He had upon one occasion prescribed bismuth in five-grain doses three times a-day, from Tuesday morning to Sunday night, and on Monday morning had found distinct evidence of arsenic in the urine. He could not weigh it, but there was enough to produce a distinct coat or mirror in the glass tube.

Cross-examined—He did not prescribe the bismuth to the patient with a view to his giving evidence in this case. He tried the experiment upon the dogs solely for his own information, and from having read in the newspapers a report of the case in which it was stated by Dr. Taylor that he believed the chlorate of potash would have the effect of passing off the poison. Witness was examined on Palmer's trial for the defence. At that time the establishment with which he was connected was called St. George's School, but the name had since been altered to the Grosvenor Place School. He was called to prove that Cook might not have died of strychnine, but of a disease called angina pectoris; and he stated that according to his own scientific knowledge and the opinions of the best authors, he believed that Cook did not die of strychnine, but of the disease he had mentioned. He was not aware how it became known that he had made the experiments upon the dogs. Mr. Humphreys, the prisoner's solicitor, called upon him as a scientific man, and requested him to appear as a witness.

By the Lord Chief Baron—He had only been a witness in a criminal court in the case of Palmer and on the present occasion. He was consulted in another case, and he gave an opinion; but he was not called as a witness.

By Sergeant Ballantine—The dog took the chlorate of potash very well. He mixed it with the poison and gave it him in his food and sometimes it was given to him in milk. He did not once nearly poison one of his patients by giving him an excessive dose of antimony wine, but he did upon one occasion prescribe fifteen minims of antimony wine to a patient, and it had a more powerful effect on him than was anticipated, and he was ill for several

days. Fifteen minims contained about the twelfth part of a grain of tartar emetic. Antimony would undoubtedly cause sickness, and sometimes purging, and it would also be calculated to produce a sensation of burning heat in the stomach, from the mouth all through the body. Sulphate of copper, or any mineral irritant, was likely to produce such a sensation as that he had just described, in any case where there was a previous irritable condition of the mucous membrane.

The cross-examination of Dr. Richardson was resumed on the morning of the fourth day of the trial.

In answer to questions put by Mr. Sergeant Ballantine, he said that he did not think that rigidity of the muscles after death was evidence that the patient had suffered from spasms. In cases of poisoning the patient frequently had spasms. The experiments he made in 1856 were not with a view to being examined as a witness. He was not called on Palmer's trial to give any evidence in reference to antimony. Witness ceased to practise as an accoucheur in the year 1854. He was of opinion that sickness arising from pregnancy, if accompanied by diarrhoea, would have accounted for all the symptoms exhibited by the deceased.

Re-examined—It was at the request of Sergeant Shee that he gave evidence in favour of Palmer, and he refused to receive any remuneration for his attendance. He expressed his opinion that Cook died from the disease of angina pectoris on cross-examination by the Attorney-General. Heat in the abdomen and the other symptoms he had mentioned were symptoms of irritant poison having been taken, but they were also symptoms of violent diarrhoea; and whenever there was an excess of acid secretion in the stomach it was likely to produce a burning sensation. If a patient was suffering from violent irritation of the stomach from any cause, the administration of sulphate of copper would be likely to increase that irritation. Witness was acquainted with many cases of pregnancy, accompanied by diarrhoea, vomiting, and violent pain in the abdomen. It was customary for the greatest toxicologists to make experiments upon dogs and the lower animals, and those experiments were recorded in the journals of science throughout Europe. There were very few cases recorded of supposed death from slow antimonial poisoning. Witness still adhered to the opinion that the deceased might have died from natural causes.

Mr. J. E. D. RODGERS deposed that he had been a lecturer on chemistry for seventeen years at the St. George's School of Medicine, and was also a registered Surgeon. Witness was examined at Palmer's trial. He was acquainted, by reading, with the symptoms of slow poisoning by arsenic and antimony, and was frequently called on by coroners to make post-mortem examinations and analyses of human bodies. He knew the nature of chlorate of potash. It was a perfectly harmless salt, and, in his opinion, it would have no effect in eliminating poison from the system; but, supposing it had that power, the poison would be removed before it had time to act upon the system. He had given chlorate of potash, as an experiment, with arsenic and antimony, and it had no effect whatever. Chlorate of potash was very much used as a wash for the mouth to sweeten the breath. Supposing arsenic and antimony to have been administered to anyone for five or six weeks, he should certainly expect to find both substances in the tissues of the body, and particularly in the liver, and also in the kidneys and the spleen; and if he did not find any poison, he should form the opinion that no poison had been administered. He did not believe it possible to find any trace of antimony in the blood without also finding it in the liver. In every case of alleged slow poisoning, the absence of poison from the tissues would lead him to entertain strong doubts whether the death was occasioned by poison. Witness could state positively, from his own experience, that nearly all the bismuth that was sold contained arsenic, and he should say to the extent of half a grain to an ounce. He did not consider Marsh's test for the discovery of arsenic in bismuth a correct one, as he had himself found it to fail. Grey powder frequently contained antimony, and he should say a greater portion than bismuth would contain of arsenic. Antimony was used in several medicines. Witness had seen many cases of rapid poisoning by arsenic, and the stomach was only ulcerated in one instance. In witness's opinion, the condition of the intestines of the deceased was not consistent with a case of slow arsenical poisoning. There was a peculiar appearance of the lining membrane of the eye that he should always look for in a case of slow

poisoning by arsenic, which was absent in this case. In a case of slow poisoning by antimony he should certainly expect to find a clammy sweat all over the body, and also a deathly coldness. He should also expect that the liver would be softened through the action of the antimony.

Cross-examined—Witness was not now connected with the Grosvenor-place School of Medicine, which was formerly called the St. George's School. Witness was examined on behalf of Palmer, to prove that as no strychnine was found in the body, Cook could not have died from strychnine. He made experiments upon animals in order to ascertain the fact he deposed to. Supposing the sixth of a grain of arsenic to be found in an evacuation, he should be of opinion that a large portion still remained in the system somewhere or other. One other gentleman connected with Grosvenor-place School was examined on Palmer's trial.

Re-examined—Grosvenor-place School had been established for thirty years as a separate school of medicine. If he did not find any poison in the body under such circumstances he should be inclined to doubt whether the experiment upon the evacuation was a correct one. There are means of obtaining copper perfectly pure for the purpose of these experiments, and he considered it a most dangerous thing to use copper of any other description, especially where a man's life was at stake. The only evidence witness gave at Palmer's trial was to the effect that if the death had been occasioned by strychnine, strychnine ought to have been found in the body, and witness still entertained the same opinion.

Dr. JOHN LOUIS W. THURSDEN deposed that he was a Doctor of Medicine and Lecturer on Practical and Experimental Chemistry, and he was also a pupil of Professor Liebig. Witness had heard the evidence of the symptoms exhibited by the deceased, and the appearances presented upon the post-mortem examination, and according to his opinion, all these symptoms were consistent with the deceased having died a natural death, and in his opinion she died of dysentery. He also said that from his experience he would state that these symptoms were not consistent with death from slow arsenical or antimonial poisoning. He was also of opinion that in any case of poisoning of this description the poison would be found in the tissues of the body.

Cross-examined—He considered the deceased died of the disease known as diphtheritic dysentery. He had attended two such cases in London. One of them was fatal. The other recovered. These cases occurred about three years ago, when witness was Physician to the St. Pancras Dispensary.

Re-examined—Witness had made an analysis of grey powder, and found that it contained, among a number of other materials, arsenic and antimony, and a larger portion of the latter than the former. He had also analysed bismuth, and found that it contained both arsenic and antimony. He could not say the quantity.

By the Lord Chief Baron—The quantity he found was more than a trace. In one instance in 120 grains of bismuth he found about half a grain of arsenic. He did not weigh it, but he should say that was about the quantity. Witness did not agree with Dr. Rodgers that the quantity of arsenic contained in bismuth did not render it improper to be used as a medicine. In his opinion it was an improper medicine to be used.

By Sergeant Ballantine—He dissolved two ounces of grey powder, and analysed about one-eighth part of that for arsenic. He had not had time to ascertain the exact quantity of arsenic and antimony in grey powder. He was well aware that he was required to make certain analyses on behalf of the prisoner, and that it would be essential to be correct. The grey powder he analysed was the description that was given to children. He was sorry to say that it was a medicine constantly given to children in doses of from half-a-grain to three or four grains. Witness did not think that the arsenic in the grey powder poisoned the deceased.

Sergeant Ballantine—Do you think it had any effect in producing the symptoms you have heard of?

Witness—I think the mercury she took might have produced the aphthous spots in the mouth. I do not think that either the arsenic or the antimony had anything to do with the death of the deceased, but they might account for the results of Dr. Taylor's analyses.

Re-examined—I think that the quantity of arsenic and antimony contained in the bismuth and the grey powder

would account for a small portion of arsenic being found in an evacuation.

Dr. F. C. WEBB, Lecturer on Medical Jurisprudence at the Grosvenor-place School of Medicine, and a Physician to the Great Northern Hospital, gave similar evidence to the last witness as to the cause of death, and said it was his opinion, from the symptoms, that the deceased died a natural death. He also expressed an opinion that the pregnancy of the deceased was a material ingredient in the case, and that it would have accounted for many of the symptoms that presented themselves. The witness also stated that he considered the administration of sulphate of copper to the deceased in her condition of pregnancy was improper, and that bismuth also ought not to have been given to her unless it was pure. He considered the deceased died of dysentery, aggravated by her pregnancy, and he had read of many such cases that had altogether baffled Medical skill. A burning pain in the bowels, purging and vomiting, were undoubtedly symptoms attending the administration of irritant poison, but similar symptoms very frequently occurred from natural causes. In cases of slow arsenical poisoning all the mucous orifices would be excoriated. He was of opinion that chlorate of potash would not in any way affect the operation of poison, and he said that if arsenic were administered and caused death, the poison must decidedly be found in the tissues of the body after death. The witness was examined at very considerable length in reference to the appearances presented upon the post-mortem examination, and he stated that all these appearances, and the absence of others, justified him in his opinion that Miss Bankes died a natural death, and that it was not the result of the administration of poison. He said that he had heard the mode in which Dr. Taylor arrived at the conclusion that the evacuation contained one-sixth of a grain of arsenic, and he said it was a mere guess, and ought not to have any weight whatever in the inquiry.

Cross-examined—If he were called in to attend the wife of a Medical man, and her husband told him that she was not in the family-way, if he found that the medicines he prescribed did not have their proper effect, he should still feel it his duty to make further inquiries to ascertain whether she was pregnant or not. He should not expect that any medicines would check such a disease as that to which he attributed the death of the deceased. He should not have dreamed of poison if he had attended upon the deceased and had seen all the symptoms which presented themselves.

Re-examined—15,000 persons died of dysentery in this country from the year 1848 to the year 1854.

Dr. G. F. GIRDWOOD deposed that he had very great experience in cases of midwifery and had seen a good many in which pregnancy was combined with dysentery, and in one case the dysentery was very severe. He considered it highly improper to administer mineral medicines in such a case. The remedy witness adopted in such a case was the application of leeches to that portion of the body where the cæcum was placed. He traced the death of the deceased in this case entirely to the dysentery, and the ulceration and exhaustion consequent upon it. All the symptoms in such a case would be aggravated by the fact that the patient was of a bilious temperament.

§ 1. Cross-examined—The dysentery of this country was not accompanied by much fever. It was different in its character from the dysentery of hot climates.

Re-examined—Witness had formed his judgment in the present case from the dysentery of this country.

Mr. JAMES EDMUNDS, Member of the College of Surgeons, and Medical Officer to the H division of police, deposed that, in the early stages of pregnancy there is frequently severe vomiting and diarrhoea, so as to produce very great exhaustion. They arise from sympathetic irritation. He added, "I know a case in which death resulted. The lady was 40, and married ten or twelve years. She suffered from severe pain in the abdomen and burning. She was ill from four to six weeks. I made a post-mortem examination of her body, in consequence of the extraordinary symptoms. Her death arose from dysentery. I think it was a case of idiopathic dysentery, with the addition of vomiting."

Cross-examined—She miscarried at the seventh month, and a week before her death. The symptoms began between the fifth and the six month. I gave her chalk, opium, and

prussic acid, and afterwards bismuth. I used sulphate of zinc as an injection, when I knew there was ulceration of the stomach. I used ten grain doses. From five to fifteen grains would be a proper dose. I did not use sulphate of copper because of the vomiting. The bismuth relieved the vomiting. In the lower bowel and the cæcum there was the most fearful ulceration. There were ulcers in which you could lay a penny.

Re-examined—I was engaged in the adjoining court, and felt it my duty to communicate the case I have mentioned to the gentlemen conducting the defence. I have seen many cases of dysentery, but this was the only fatal one. I am acquainted with cases of early pregnancy, in which vomiting and diarrhoea were combined, but vomiting is more frequent.

Dr. TYLER SMITH deposed that excessive vomiting was a common disorder of pregnancy, which sometimes continued in defiance of all remedies, until it ended fatally. The death in these cases, was caused by exhaustion, in fact, by starvation. Diarrhoea was sometimes produced by the irritation of the gravid uterus, and pregnant women were liable to dysentery and cholera. It usually happened that abortion was produced by any serious affection of the bowels during pregnancy. He had been consulted in four cases in which the vomiting of pregnancy resulted in death. Heartburn was a very common disorder of the pregnant state, and the amount of acid secreted by the stomach in such cases, was sometimes enormous. Excessive vomiting was very likely to occur in a woman pregnant for the first time at mature age, of bilious temperament, and the subject of uterine disorder, for which an injection of nitrate of silver would be used. Menstruation was not uncommon in the first two or three months of gestation, especially in patients affected with uterine disease. The presence of menstruation would not alone have led him to disbelieve in the existence of pregnancy. He should have suspected it and made the necessary examination, in such a case as that of Miss Bankes. The treatment recognised by the first obstetricians of this and other countries, was to produce abortion as soon as dangerous symptoms set in. In some of the cases he had seen, the stomach retained food for a few days before death. This was the case in the history of the celebrated Charlotte Brontë, who died after vomiting incessantly for six weeks, during pregnancy. The disorder often commenced immediately after impregnation. Dr. Paul Dubois, who had seen twenty fatal cases of vomiting during pregnancy in thirteen years, expressly notices a morbid expression of the features, as one of the symptoms of danger, calling for the induction of abortion. During the last two or three years, especially since the prevalence of diphtheria, he had frequently found pregnant women, and lying-in patients, affected with an aphthous condition of the mouth and throat.

Dr. Tyler Smith was not cross-examined.

A NEW CAVITY, called by its discoverer "preperitoneal," has been announced by M. Retzius. It has hitherto, he says, escaped the observation of anatomists. In examining the disposition of the transverse muscles and their aponeuroses, he found this circumscribed cavity, which serves to facilitate the play, distension, and contraction of the bladder.

EVERY anatomist will remember the experiments of Magendie upon the cephalo-spinal liquid. He found when this liquid was removed, that the animals operated on fell on one side or the other, and lastly fell down altogether. M. Longet afterwards showed that the same phenomena occurred when the muscles of the spine alone were cut; and that when the fluid was removed, without cutting the muscles, nothing of these phenomena resulted. An observation lately made by M. Jobert confirms the experiments of M. Longet. A young woman received a stab of a dagger from her lover in the cervical region, the blade entering between the sixth and seventh vertebræ, and its point remaining broken in the wound. During two days, the bed of the patient was continually wetted with a transparent limpid fluid; on the third day the broken piece was removed, and at the time of the operation there escaped about a glassful of this fluid. It was analysed by M. Grassi, who found that it was analogous to water, containing in suspension some blood globules. This patient presented nothing extraordinary in her movements, and her mental powers were quite unaffected.

ORIGINAL COMMUNICATIONS.

ON CYANOSIS,
AND
THE NATURE AND VALUE OF TEMPORARY
BASIC SYSTOLIC MURMUR.

By WILLIAM TILBURY FOX, M.D. Lond.
University Medical Scholar.

THE following case appears to me unique, and of practical import in regard to certain dubious points in the ætiology of cyanotic disease.

The following are the facts of the case:—

A baby which was perfectly healthy in all respects at the time of birth, on the eleventh day became affected with the characteristic discoloration of cyanosis. The nurse noticed that, when the child was being washed, "it turned black," especially about the face. This, the first unusual circumstance, was accompanied by convulsive twitches, which were slight and pretty general, but soon disappeared. The discoloration now became uniform and constant; it was well developed. The temperature of the surface was good (the child was well wrapped up); the nutritive functions were perfect; there was no dyspnoea; the respiration appeared occasionally to be laboured, but was generally quiet, indeed markedly calm. There was no cardiac distress of any kind observed. The veins of the neck were not abnormally full nor visible. The child really appeared to suffer no inconvenience. In forty-eight hours the intensity of the discoloration was lost; at the end of a week all trace of the disease had vanished, its last remnants passing through the various hues incidental to the case of ecchymosis. Slight jaundice appeared to accompany this later part of the attack. During the commencement of the disease, no auscultation was practised, unfortunately; but subsequently, just as the intensity of the discoloration was subsiding, no abnormal sound could be detected over the cardiac region. Vomiting occurred prior to the attack. Hæmaturia was present during the height of the affection, and so large in amount as to give rise to the greatest alarm and anxiety. There was a serious loss. Blood corpuscles were detected in the urine by the microscope. Though the evidence present was chiefly negative, still the child was not expected to survive many hours. The little patient has continued free from ailment of every kind up to the present time (it is now six months old).

What diagnosis could be made? The child was perfectly healthy till the eleventh day; there could be then no serious congenital malformation; and this opinion was corroborated subsequently by the temporary duration of the attack. The most common accompaniment occurring after birth (non-congenital), is endocarditis, according to observers, which through its effects becomes a cause of cyanosis. The existence of such a lesion could scarcely be entertained in the present instance. The time of the occurrence, together with the subsequent history and the temporary character of the attack (in its intensity forty-eight hours), all suggested a cause coming into play at the time the usual complementary changes were being effected between the ductus arteriosus, foramen ovale, and pulmonary vessels. The cause was temporary, and it was also of pretty sudden occurrence, as evidenced by the tolerably rapid onset of the attack, and more particularly the presence of hæmaturia. The affection had, so to speak, a mechanical aspect. Two explanations were entertained to account for the attack:—1. Dilatation of the right auricle. 2. Increased patency of the foramen ovale.

Now, firstly, so far as my reading and limited experience go, I know of no case of dilatation of the auricle as the sole (primary) disease. It is always a secondary lesion. Billard relates a case of what he called "passive aneurism" of the auricle, but in this instance there existed obstructive disease on the left, quite sufficient to account for the lesion found on the right side of the heart. Of course this state of things is not uncommon. That any such conditions existed (even in a minor degree) in the case in point

could not be maintained in the face of the evanescent character of the attack, the absence of all detectable or probable cause of dilatation, or of any of the symptoms which invariably accompany auricular dilatation, viz., syncope (prolonged), irregular action of the heart, palpitation, dyspnoea, prominent and enlarged cervical veins, etc.

Secondly, there was no reason to suppose that more free admixture of the blood of the two sides of the heart occurred at the time of the onset of the attack (unless the vomiting prior to the attack might be considered sufficient to unbalance the circulation), indeed, the subsequent course of the case supported the opinion that the proper changes were being effected in the foramen ovale and duct (that they were in progress of closure). Could the vomiting give rise to greater distension or pressure in the right than left auricle, and so reopen or enlarge the foramen ovale? Then, again, could such an amount of patency be produced by the vomiting as to fully account for the severity of the attack, and yet be repaired in two or three days (probably in forty-eight hours), seeing that a much longer time is required for the normal closure of the small aperture existing at birth? But the occurrence of the hæmorrhage in such large amount, as in the present case, remains unaccounted for and unexplained, by the supposition of increased patency of the foramen ovale, for it corresponded entirely in severity with that of the cyanotic hue, and the two seem to be explicable only by the same cause, and that a mechanical one. The clinical history of patent foramen ovale taken in conjunction with the short duration of the attack, will scarcely confirm the diagnosis now entertained.

Thirdly, the hypothesis which best accounts for the cyanosis, and accords with the facts of the case occurring at the time of, and subsequently to, the attack, most perfectly, appears to me to be the following:—The ductus arteriosus and foramen ovale at the time of the appearance of the disease (the eleventh day), had become less and less patent, the changes in them may have been, and probably were, a little later than usual in taking place (the cause will appear directly), and hence the pulmonary artery and branches had become adapted to the particular current which was passing through them. By the closure of the foramen ovale, and the arterial duct (the latter closing first), all the blood of the right side of the heart was compelled to travel through the pulmonary artery and its branches, which now presented some obstruction (congenital perhaps in part—in part perhaps due to the late occurrence of the proper changes in the ductus arteriosus and foramen ovale); after a little time, however, the obstruction was overcome, and the cyanosis removed. The following points confirm such a view.

The time of the occurrence of the affection, the manner of onset and disappearance (after sufficient time had elapsed during which the obstruction could be overcome). The absence of all evidence of disease of a congenital or non-congenital nature to cause more free admixture of the two kinds of blood, or to lead to obstruction to the free circulation of blood through the heart (such a cause would be permanent), the absence of all lung affection (atelectasis, etc.), the absence of murmur, etc.

That obstructive disease existed (or else why the hæmorrhage), and that such obstruction was temporary, is certain; and that the cause of the latter was the disturbance of the balance of normal changes going on in the vessels and openings connected with the heart, is the only feasible hypothesis. Again, though it is uncertain whether in this case there existed congenital obstruction of the pulmonary artery (or branches), or whether this was the result of late closure of the foramen ovale and ductus arteriosus: the fact, that the additional action of the latter process was the culminating point in the causation of the cyanosis, remains unaffected. Was there congenital pulmonary obstruction present? Certainly not to any extent. It is not difficult to suppose that an amount of obstruction existing in the pulmonary vessel (or vessels), and insufficient to cause cyanosis *per se*, may be rendered quite adequate to produce it, by the action of the additional obstruction caused by the closure of the ductus arteriosus and foramen ovale. Now, patency of the two latter, and obstructive disease are so frequently co-existent, that one naturally asks if they be not related to each other as cause and effect. Can we imagine with any degree of probability that any cause was present, inducing late closure of the duct and the foramen?

I have recorded the above case, because being an uncomplicated one, it supports the opinion originally expressed by Morgagni (and which is more generally adopted now-a-days), that cyanosis cannot be produced unless there be obstruction to the free current of blood through the heart. The observations of Dr. Moreton Stille, and the able summing up of Dr. Peacock, are valuable confirmations.

Certainly it must be allowed that cyanosis may result without any mixture of the two kinds of blood, and the most perfect and free admixture may occur, and yet no cyanosis result. I need not quote cases in proof. The objection that in after life you can demonstrate immense and intense obstruction and no cyanosis, is not valid; the structures are in a materially different condition, as pointed out by Dr. Chevers.

The great argument used by those who consider intermixture as the cause of cyanosis, is the frequent concomitance of patency of the foramen ovale or septal deficiency, and the like. Dr. Walshe thus puts the matter: "How comes it, if communication between the two sides of the heart be so unimportant that in five only out of seventy-one cases collected by Stille was such communication wanting?" Is not such communication necessarily present in the majority of cases of cyanosis? Any case fatal within a few days of birth, of course, presents a patent foramen ovale, and arterial duct. (Forty of Stille's seventy-one cases were congenital.) Septal deficiency or patency of any kind is an effect of the cause which produces cyanosis. If arrest of development (or disease) occurs (and obstruction result); it at the same time retards the proper changes ensuing, which would close the communication between the two sides of the heart. The effect of obstructive disease is to favour intercommunication between the two sides of the heart, and patency of the arterial duct (necessary conservative effects).

But, *per contra*, septal deficiency, or too great patency of the arterial duct, or foramen ovale, from arrest of development or other cause, will prevent the proper amount of blood taking its proper channel (the pulmonary artery), which will contract, and if from any cause the septal deficiency, etc. should be rectified, the pulmonary obstruction (which is secondary in this case) might become in consequence a cause of cyanosis.

Various considerations render it probable that pulmonary obstructive disease is the more frequent (if not the constant) primary lesion. It is certainly the most frequent pathological condition. (In fifty-three out of sixty-two cases collected by Stille.)

Pulmonary obstructive disease, secondary to septal deficiency, and the like, must be a curiosity, for since very little blood traverses the pulmonary vessels during intra-uterine life, the deficiency can scarcely influence the condition of the latter, unless it be very extensive, which is decidedly uncommon, and in non-congenital cases its infrequency disallows the supposition of its being a cause of secondary obstruction. In non-congenital cases obstructive disease is sufficiently frequent to account for the concomitance of intercommunication. In so far as these two conditions stand to each other as cause and effect, it seems pretty evident that the obstructive disease is the cause of the (secondary lesion) intercommunication, etc.

But, after every argument has been exhausted by the two opposing sides, one cannot but find, after a little reflection, that the dispute concerns a very immaterial matter. The effect of obstructive disease and intermixture of the two kinds of blood, is the same in kind, viz. to cause the presence of venous blood in the capillaries, only in the case of obstruction, the amount is much greater, and there is present the additional effect peculiar to obstruction, viz. capillary distension.

It cannot be absolutely denied, upon the evidence of facts, that intermixture is incapable of giving rise to cyanosis, but such intermixture must be of the most free and perfect kind; obstructive disease is the more powerful cause of cyanosis; the more free the mixture, the less the obstruction required to produce cyanosis. The case I record can scarcely be explained, except upon the supposition of the existence of obstructive disease, either congenital, and made evident in its effects by the closure of the ductus arteriosus and foramen ovale, or of non-congenital, the result of late closure of the two latter; because the subsequent history of the case decidedly disallowed the assumption that the proper changes had not been

effected in the foramen ovale and arterial duct. The former, perhaps, is the more probable.

But where was the obstruction seated? There was no murmur to be heard on auscultating the cardiac region during the intensity of the attack, but murmur may have existed at the outset. This is the only evidence upon which to form an opinion. Considering the intensity of the attack, as judged of by the degree of discoloration, and amount of hæmorrhage, it seems probable that closure of the foramen ovale alone was insufficient to account for the result. This, in conjunction with the absence of pulmonary constrictive murmur, would lead one to locate the obstruction at some point beyond the arterial duct. At the same time it must be remembered that the attack corresponded in point of time with that of the closure of the foramen ovale, and that murmur was not sought for at the outset. The hæmaturia indicated severe obstruction, and it was probably in part congenital.

Gloucester-gardens, W.

(To be continued.)

CASES OF DIPHTHERIA,

WITH REMARKS ON

THE PATHOLOGY, SYMPTOMS, AND TREATMENT OF THE DISEASE.

By J. S. BRISTOWE, M.D. F.R.C.P.

(Continued from page 181.)

In this the second part of my communication, it is my intention not to give a detailed account of the pathological condition of all organs, to enter into a minute analysis of all symptoms, and to discuss the various forms of treatment that have been adopted; but simply to dwell on such points connected with the pathology, symptoms, and treatment of the disease as are of real interest or importance, or have appeared so to me in the cases that have come under my observation. And I may here state, that the remarks which follow are not founded on the previously-detailed cases alone; but additionally on six or seven other cases which I have had more or less satisfactory opportunities of watching during life; on one other careful and complete necropsy; and on various specimens of diphtheritic throats, false membranes, and kidneys which have been submitted to me at different times for examination.

Pathology (a).—The most prominent, and probably the most characteristic, feature belonging to diphtheria, consists in the deposition of a false membrane upon the fauces, pharynx, and adjacent parts. This membrane appears very early in the disease, and perhaps generally first on the tonsils, in the form of one or more whitish or greyish circumscribed patches, not unlike those resulting from the application of nitrate of silver. Having once commenced it extends rapidly, so that in the course of a day or two, or even in less time than this, it may have formed a tolerably uniform layer, covering the whole of the tonsils, the pillars of the fauces, the soft palate, pharynx, and base of the tongue; may have involved the posterior nares, and the larynx itself; and may even have spread into the trachea and bronchial tubes, or down the œsophagus possibly to its cardiac orifice. Its thickness increases with its area, and at the same time it becomes of a more opaque, dirty white hue, and more or less fissured on the surface. At the end of several days it ceases to spread, its edges begin to curl up, it becomes gradually detached, and comes away either as a complete membranous cast, or in a more or less softened and fragmentary condition. The deposition of this material is associated with, and no doubt dependent upon, a peculiar form of inflammation in the sub-jacent mucous membrane, attended by a variable amount of congestion and inflammatory exudation into the submucous tissue; in consequence of which a more or less brawny condition of parts is produced, especially observable in the lax cellular tissue of the larynx, when that organ becomes involved. The local inflammation is commonly neither very severe nor very deep, and disappears with the detachment of the membrane, leaving only a delicate and sensitive, or at most slightly excoriated, surface behind. But, in some instances, the inflammation is of a much more intense character; involves the substance of the tonsils, causing them to swell, soften,

suppurate, and even to slough; includes the lymphatic glands about the angles of the jaws; and may even extend throughout the whole of the tissues of the throat as far down as the sternum, rendering them hard, brawny, and intensely congested. It follows, therefore, that while the faucial inflammation is generally superficial, and the false membrane generally limited to the mucous membrane of the throat, the former may penetrate to any depth and be followed by any of the recognised results of inflammation, and the latter may spread to any of the adjacent prolongations of mucous membrane; either of which circumstances must materially modify the symptoms, and affect the issue, of the case.

The false membrane itself varies in thickness from a line or two downwards, and in consistence from that of ordinary recently-coagulated lymph to a friable or even diffuent pulp. It consists essentially, according to microscopic examination, of a network of coagulated fibrine, in itself not materially different from that deposited on inflamed serous surfaces; but mixed more or less with the proper epithelium of the part, with imperfectly-formed or breaking down cells, and with granular matter. I believe that in the first instance the lymph is effused beneath and among the epithelial structures, entangling them in its meshes; and that the subsequent exudation accumulates beneath the layer thus formed, becoming gradually more and more free from cell-formation, and more and more purely lymph; so that in the fully formed membrane the attached surface will be found to consist of coagulated fibrine alone, the superficial of a certain amount of fibrinous exudation, together with epithelium, and any accidental matters of which may have become adherent to it. It has never happened to me to detect in it any vegetable growths, and it is evident that their occasional presence is accidental only and quite unimportant. The false membrane of diphtheria has no specific character; it is not only not due to any form of parasitic growth, but it differs, according to my own examinations, in no respect from the false membrane of common croup, nor from that occurring occasionally in cases of erysipelas, nor lastly, I believe, in any important point from the exudation upon the pharynx and larynx occurring in the course of small-pox. I have examined the subjacent muscular fibres, imbedded even in inflammatory exudation, and found them to display their normal, striated character.

(b.) The lungs exhibit usually, I believe, a healthy appearance; still they occasionally present conditions which deserve consideration. It is recorded that in some instances the diphtheritic membrane, as in cases of croup, has extended from the larynx and trachea into the bronchial tubes. Further, when the larynx is affected, the tubes become generally loaded with secretion. But the most remarkable condition I have observed is one which in extreme cases affects pretty uniformly the whole of both lungs. These organs become more heavy and solid than natural, in consequence of extensive hepatization; the hepatization occurring in patches of small size, which are thickly and uniformly scattered, and separated from one another by a network of still crepitant tissue. The solid patches are granular, sometimes presenting the characters of red hepatization, sometimes those of apoplexy, and sometimes those of purulent infiltration. The affection, is in fact a well-marked and true lobular pneumonia. It appeared in an early and imperfect stage in the case of T. N.; but was exceedingly well-developed in the case of M. A. F., and in one recently under Mr. Simon's care; both of which latter proved fatal at a comparatively late period of the disease. This affection of the lungs is interesting and important; but is not peculiar to diphtheria. It is, I believe, a not uncommon sequel of laryngeal disease, and is allied to, if not identical with, a condition of the lungs resulting, more especially in children, from capillary bronchitis.

(c.) The kidneys in all cases which I have examined have to the naked eye appeared perfectly healthy; but when tested by the microscope have invariably displayed distinct marks of disease. The disease, which is no doubt inflammatory, manifests itself in its milder forms by a little hæmorrhagic exudation into the tubules, and a granular condition of the epithelial cells. In its more severe forms, the epithelial cells are swelled up so as almost to obliterate the channel of the tubes, are opaque with granular matter and oil, and seem often to have lost their mutual adhesion; cylinders of the diseased epithelium become shed, and in addition transparent fibrinous casts are produced, and traces

of intra-tubular hæmorrhage are seen. The malpighian bodies seem generally healthy, but in some instances a little exudation matter may be recognised between the capsule and contained tuft.

(d.) The heart is usually in a normal state, but in one instance in which I examined it carefully, its fibres were in a well-marked fatty condition; and in the same case there had been extravasation of blood into its muscular tissue.

(e.) The blood, so far as its appearance goes, has seemed normal, and has furnished the ordinary forms of coagula in the heart's cavities. But that this fluid is an unnatural condition, at all events in some cases, is shown by the fact of the occasional appearance of a kind of dark measley eruption, probably petechial, shortly before death; and by the occurrence in the case of T. N. of similar extravasations on the surface of many of the internal organs, and in the substance of the heart and supra-renal capsules.

(f.) I have never observed any eruption on the skin, beyond that above alluded to, nor any evidence of desquamation. I have not recognised any traces of dropsical effusion, although from the condition of the kidneys its supervention might reasonably be expected. And, finally, I have met with no pathological conditions in any other organs, sufficiently constant or sufficiently important, to render the details of them worthy of record.

I may add that, as may be seen by comparing the case of T. N. with the others above recorded, diphtheria, like small-pox, scarlatina, and some other fevers, may vary from a comparatively simple and mild disorder, to one of the utmost malignity, attended by that rapid sinking, and by those internal hæmorrhages which characterise such types of disease.

Symptoms.—The symptoms of the disease have been so well described that I ought, perhaps, to apologise for venturing to make any observations on this head. I am desirous, however, before discussing the treatment, briefly to call attention to the more important symptoms, to contrast them with those presented by other diseases with which diphtheria is liable to be confounded, and to review the different modes in which death appears to be produced.

(a.) The usual history of a mild diphtheritic attack is, I believe, the following:—The patient without, or at most with extremely mild, premonitory symptoms, is attacked with slight soreness of the throat—that soreness being associated, even from the first, with the deposition of false membrane, and unattended by the ordinary symptoms of fever. For several days the soreness of throat increases, the membrane extends, and some fullness and tenderness appear in the submaxillary regions. There is still, however, no appearance of fever, no unnatural heat of skin, no pains in the head, back, or limbs, no dryness of tongue, no marked thirst, and no tendency to delirium at night; yet the patient loses strength, and the urine possibly becomes albuminous. After the further lapse of a few days, the soreness in the throat and the external tenderness diminish; the false membrane separates, leaving the denuded surface either slightly excoriated or simply irritable, and but for the probably now confirmed albuminous condition of the urine and the increase of debility the patient appears to be going on favourably. Notwithstanding, however, the disappearance of all those symptoms which in the beginning were looked on with alarm, the patient, with no obvious cause, except perhaps the persistence of albuminuria, still loses strength, becomes anæmic, and finally recovers health only after a very protracted and fluctuating convalescence.

The above detailed symptoms are probably those of nearly all cases of diphtheria; but the most remarkable of these are the affection of the throat, the absence more or less complete of fever, the condition of the urine, and the great debility. They are, however, liable to vary somewhat, according to the severity of the attack and probably accidental circumstances, and occasionally others of more or less importance may be superadded.

(To be continued.)

TYING THE COMMON CAROTID ARTERY.—The *New York Medical Press* states that on June 1 Professor Mott tied the common carotid artery for the forty-sixth time. The operation was for fungoid disease of the left side of the face, for which the Doctor, on October 5 performed a similar operation on the diseased side, which produced only a partial diminution of the tumour.

THE LONDON
PRACTICE OF MEDICINE AND SURGERY.

GUY'S HOSPITAL.

COMPOUND DISLOCATION OF THE ANKLE—
REDUCTION, AND ATTEMPT TO SAVE
THE LIMB.

(Under the care of Mr. BRYANT.)

A VERY complete example of compound dislocation of the ankle was admitted a month ago into Guy's under the care of Mr. Bryant. The subject of it was a healthy lad, aged 14, from Charlton, in Kent. He had "dropped" from the bough of a tree, a height of twenty feet. It appeared that he came to the ground upright, but with one foot lower than the other, and probably a little bent, and thus the whole weight of the trunk being received on this ankle, the result had been that the ligaments had given way, and the tibia and fibula had been driven through the skin on the outer side of the articulation. He had been brought to the hospital without any attempt at reduction having previously been made, and when admitted the foot was turned in at right angles with its normal position, its outer border looking downwards. The whole articular extremity of the tibia was exposed. The tip of the outer malleolus had been knocked off, and the inner malleolus appeared to have been fractured at its base. The arteries had not been injured, and the bleeding had been but slight. Mr. Bryant easily effected reduction, and having done so the limb was put up on a back splint, with a piece of lint applied over the wound. Ice, or iced water, was kept constantly applied to the joint during the next week.

Great interest attaches to the prognosis of such a case as the above. Sir Astley Cooper, as is well known, recorded several examples of compound dislocations of the ankle, which had done remarkably well; but he forgot to collect any statistics respecting the lesion, and to record the cases which had ended fatally. The result has certainly been that the risks attaching to this form of accident have been much underrated. Speaking from general impressions, founded on observation in the wards of the London Hospitals during the last ten years, we should say that the results obtained have been far from encouraging. Generally a most profuse suppurative inflammation of the articulation follows, and secondary amputation becomes needful. The instances of good recovery which we have witnessed have been decidedly exceptional. In attempting to estimate the kind of danger attaching to this injury, we are obliged to take the ankle-joint by itself, for no other articulation is liable with any degree of frequency to compound dislocation, without extensive injury to the soft parts. In London practice, although the rule is to attempt to save limbs after this accident, provided the vessels have escaped, yet it has many exceptions. About six years ago we well remember seeing a young man brought into University College Hospital under the care of the late Mr. Statham, with a foot in exactly the same condition as that above described in Mr. Bryant's case. Mr. Statham (although a writer of authority on "Conservative Surgery") performed primary amputation within an hour or two of the man's admission.

In the Liverpool Royal Infirmary, three weeks ago, we saw a young man under Mr. Bickersteth's care, in whom an attempt had been made to save the limb after compound dislocation of the ankle. Disorganising inflammation had followed, and subsequent resection of the articular end of the tibia had been practised. The state of things had improved much since the operation, but there was still at the time of our visit great swelling about the parts, and it was clear that a long time must elapse before they returned to a state of soundness. There was, however, every probability that the limb would eventually be saved; but it must not be forgotten that the man had run considerable risk of his life.

To return, after this long digression, to the facts of Mr. Bryant's case. At the time of the reduction, Mr. Bryant observed that he had three courses open,—to reduce, to amputate, or to excise the articular facets of the bones. The early age and good health of his subject inclined him to the first of these. The result has proved that his judgment was

correct. Hitherto no inflammation of the joint whatever has occurred, and a month has now elapsed and the external wound is almost healed. Probably the irrigation treatment with iced water has had much influence in restraining the tendency to inflammation. It had at any rate the effect of making the lad very comfortable, and from the first he scarcely lost his rest.

FALSE ANEURISM OF THE ULNAR ARTERY—
LIGATURE OF THE ULNAR AND RADIAL—
RECOVERY.

(Under the care of Mr. POLAND.)

A man of nearly 30, was admitted the other day under Mr. Poland's care, on account of pulsating swelling in the front of one wrist, just below the pisiform bone. It was about the size of a bantam's egg, and was plainly aneurismal. The account given was that a month ago the man had received a deep cut with a knife, and that profuse bleeding resulted, which was restrained by a tight bandage. The wound quickly healed, but the swelling soon afterwards formed.

The tumour being so close to the wrist joint, and to the ligamentous structures adjacent to it, Mr. Poland did not incline to lay it open and secure both ends of the vessel. At the same time its position, as regards the communication between the ulnar and radial, made it improbable that ligature of the former only would suffice to the cure. Ligatures were accordingly put on the trunks of both radial and ulnar, at a short distance above the wrist, and with the effect of entirely controlling the pulsation. Thus far the case has done remarkably well.

ST. GEORGE'S AND THE LONDON
HOSPITALS.

TWO CASES OF RECOVERY FROM TETANUS.

(Under the care of Dr. BENICE JONES and Mr. CRITCHETT.)

We have often, in recording cases of recovery from tetanus, had to direct attention to the fact that recoveries occur in a very large proportion of instances in patients whose history of the accident is obscure. In not a few the disease is believed to have been idiopathic, in others the exciting cause has been slight, or even doubtful, or it has perhaps been applied at a period long before the outbreak of symptoms. Cases in which the injury has been well recognised, and in which the symptoms have supervened within ten days of its occurrence, recover with extreme rarity.

A case which has just been under Dr. Benice Jones's care in St. George's Hospital, affords another illustration of the truth of the above remarks. The patient, a girl, aged 7, was admitted with a choking sensation in the throat, and unable to swallow, and complaining also of some stiffness in one of the legs. There was a very doubtful history of her having bitten her tongue ten days before. On the mouth being partially forced open, a large ulcer was seen under the tongue, the latter being much furred. Cinchona and chlorate of potash were ordered, and no material change occurred for three days, when she was suddenly seized with a violent tetanic spasm. After this the symptoms developed themselves, and there could be no doubt about the disease being genuine tetanus. As a usual thing her extremities were rigid and fixed, and her abdomen hard and board-like, while convulsions frequently occurred. Her pain was not extreme, and the symptoms were in some respects irregular. Thus, the pulse never became rapid, and the masseter muscles were not contracted. She had, however, for several nights, in spite of opium, almost no sleep, and after the illness had lasted a fortnight, she had become emaciated to an extreme degree. The treatment had been by the free use of various forms of stimulants, and the moderate employment of opiates. It was not until the fourteenth day that any material improvement set in, but from this time it was rapidly progressive, and within a week all tetanic symptoms had passed away, and the muscles had no longer any degree of rigidity. After a month's longer stay in the Hospital, in order to regain her strength, the child was discharged in a good state of health in every respect.

In this case there was no doubt about the existence of an ulcer under the tongue, though it was uncertain as to what

had been the cause of that ulcer, and whether the ulcer, or any supposed injury from the teeth, which had produced it, had been the exciting cause of the tetanus. The symptoms of tetanus had never been peracute, and when at length they began to subside, the recovery was unusually rapid. The following case, now under care in the London Hospital, is of interest in relation to the same subject.

A healthy-looking boy was admitted on Saturday week, with the statement that he had fallen and hurt his back on the previous day. Symptoms of undoubted trismus had already developed themselves, and were quickly followed by those of general tetanus. Most careful inquiries were made as to any prior injury, but none was acknowledged, nor were there any traces left by the fall of the previous day. A mere bruise of very slight description was all that he had received. We saw the boy at the time of Mr. Critchett's visit (under whose care he was), on the Thursday following his admission, the disease was then well-marked, and moderately acute, although it was reported not to have increased in severity during the preceding forty-eight hours. The abdomen was as hard as board, the limbs rigid, and the jaw clenched. Slight paroxysmal spasms occurred about every five minutes. The treatment had been by conium and stimulants, and on several occasions chloroform had been inhaled, always with great relief. The boy was very quickly affected by the latter agent, and passed into a quiet sleep, during which the jaw relaxed. Mr. Critchett ordered that it should be tried more frequently; and expressed himself as quite hopeful as to the final issue of the case.

At present (August 26) the subject of the above notes is out of danger, and able to take food well. Most of the tetanic symptoms have wholly subsided. Mr. Curling, in his able monograph on Tetanus, has insisted on the importance of ability to swallow as a sign of good omen. In both the above cases the patients were, throughout the illness, able to accomplish deglutition without inducing spasm.

THE ROYAL OPHTHALMIC HOSPITAL.

CORNEAL FISTULA CURED BY CAUTERISATION WITH COUNTER PUNCTURE.

(Under the care of Mr. DIXON.)

An elderly woman, who had been operated on for cataract (by extraction) two years before, was admitted a few weeks ago under Mr. Dixon's care at the Ophthalmic Hospital, with the complaint that her eye was failing her. Only one eye (the left) had originally been operated on, and she had obtained very good sight from it. It was only within a few weeks that her power of vision had been failing. On carefully looking at the eye Mr. Dixon discovered that near the middle of the cicatrix, which was rather broad, was a minute fistula, through which the aqueous humour slowly drained away. The anterior chamber remained nearly as full as usual, and the plane of the iris was vertical, the process of resecretion supplying the loss by the fistula. The latter might, indeed, have been easily overlooked. It was only by absorbing the moisture adjacent to it by blotting-paper, and protecting it from the tears from above, that the welling up of aqueous humour through it could be positively demonstrated. Mr. Dixon remarked that he had no doubt that this fistula had opened only recently. If it had remained from the time of the operation, the patient would not have had such good sight as she had enjoyed until quite latterly. His experience of corneal fistulæ was, that however completely the resecretion of fluid might keep pace with the loss, yet sight was always rendered very imperfect. Probably, in this instance, the cicatrix had from the first been thin and stretched, and now, from some accidental cause, it had given way at its thinnest spot. To cure the fistula was plainly the object of treatment, and its almost invisible minuteness rendered this no easy matter. Mr. Dixon at first tried touching it with a fine probe coated with nitrate of silver. This was done twice; and on the second occasion for a few days it was thought to have been successful; but, ultimately, the little channel again opened itself. On the third occasion, Mr. Dixon made a counter puncture at the lower part of the cornea, and let out the aqueous fluid, having just before again applied the caustic to the orifice. The eye was kept quiet by strips of plaster.

It was hoped that during the time the cornea was flaccid, from the removal of the contents of the anterior chamber-union might ensue. The result justified this expectation; and when we last saw the patient, the fistula appeared soundly healed, and the woman's sight was improving.

THE LONDON HOSPITAL.

TERTIARY SYPHILIS PRESENTING VERY UNUSUAL FEATURES.

(Under the care of Mr. CURLING.)

Cases in which difficulties present themselves in the diagnosis between syphilis and cancer are far from infrequent. Hard-edged syphilitic ulcers on the lip, indurations in the tongue, ulcers on the os uteri, etc., often present characters which render the differential diagnosis very perplexing. We rarely, however, recollect to have seen a case in which it was more so, than that of a man now under Mr. Curling's care in the London Hospital.

The reader must imagine before him a thin, wan Irishman, of earthy complexion, calling himself 55, but looking ten years older. On his right leg, above the heel and crossing the tendo-achillis, is a large ulcer with raised, ragged, and somewhat everted edges, with masses of granulations sprouting here and there near its margin, presenting a *tout ensemble* almost equally like an epithelial carcinoma and a cachectic tertiary ulcer. Following the limb upwards, we find the popliteal space filled by a mass which adheres firmly both to the skin and the subjacent tissues, and is almost of stony hardness. In the centre of this lump is a single small ulcer, not larger than a sixpence, with livid edges, and into which a probe may be passed for several inches. From the large cavity in the middle of the mass a fetid discharge proceeds, and every now and then an attack of bleeding occurs. Following the course of the lymphatics still higher, there is found just below the groin another mass of agglutinated subcutaneous glands, the whole as large as the half of an orange, and as hard as a cancer in the breast usually is. This mass, like that in the popliteal space, has softened in its centre, and from two or three points small quantities of thin pus ooze out. The whole of the lower extremity is oedematous, and considerably swollen.

With regard to history, there is no doubt about the man's having had syphilis. He states that he was salivated for it in St. Thomas' Hospital about twenty years ago, and lost several of his teeth. He has lost a considerable portion of his glands, probably by a phagedenic chancre, and in both groins are the scars of ulcerated buboes. He denies, however, having ever had rash or sore-throat. In front of both shins are the scars (now quite sound) of former ulcerations. It does not do, however, hastily to assume that because a man has had syphilis, even in a severe form, that, therefore, every affection from which he may subsequently suffer is necessarily syphilitic.

In the present case, the large indurated masses in the ham and groin are the chief elements of difficulty. They are quite hard enough to be cancer, and the way in which they have glued themselves to adjacent parts closely resembles the habitude of that disease. All observers will probably agree that the affection, or otherwise of the lymphatic system, is one of the most valuable diagnostics between venereal sores of constitutional origin and malignant ones. In syphilitic ulcerations (primary, of course, excepted) it is very unusual to find the group of glands proximal to the sore enlarged, whilst such is usually the case sooner or later if the ulcer be cancerous. On the other hand, supposing the disease in the above case to be cancer, the supuration of both masses of enlarged glands would become a very unusual phenomenon.

Taking into careful consideration all the facts, both *pro* and *con*, we believe that Mr. Curling has formed a strong opinion as to the syphilitic nature of the disease. The man has been placed under specific treatment. Should anything occur in the future progress of the case tending to show that the heading we have ventured to adopt is erroneous, we shall take care to again ask attention to it.

At one of the religious "Revival" meetings at Comber, Belfast, a woman under the influence, it is supposed, of the excitement, suddenly died. The coroner's jury brought the death in, as from an attack of apoplexy.

THE PROVINCIAL
PRACTICE OF MEDICINE AND SURGERY.

THE NORWICH HOSPITAL.

STATISTICS OF LITHOTRITY.

A letter from Mr. Williams, the Resident Surgeon of the Norfolk and Norwich Hospital in our last week's Journal demands some notice here. Mr. Williams refers to the fact that in our recently-published statistical list of lithotritry cases, only one case was quoted from the Hospital mentioned, when the fact was that during the period to which the report referred, eight cases had occurred. The mistake is Mr. Williams's, and not ours. In prefacing our Provincial Statistics, we expressly stated that we had not been able to obtain data from several of the Hospital mentioned in our list during portions of the period alluded to (1854 to 1858). In the instance of the Norwich Hospital, the data had been supplied to us only once, *i. e.* for the last of the years mentioned. All the cases given in Mr. Williams's letter occurred in prior years, and it was therefore impossible that we should include them.

The Norwich Hospital probably has as large an experience in respect to stone cases as any in the United Kingdom. Mr. Williams's list of cases is therefore well worthy a few moments' attention. It comprises seven cases, in all of which the patients were adults, and all of which resulted in recovery. Two of them were, however, subjected to lithotomy, subsequent to an attempt to cure by lithotritry, in one the more radical operation being performed several months after apparent cure by the latter. The fatality after lithotritry in the Provincial Hospitals we showed to be one in eight, while in about the same proportion lithotomy is found to be subsequently required. This group of Norfolk cases does not, therefore, materially alter our deductions. It is important as showing the infrequency with which lithotritry is resorted to, since during the term included, forty-six stone patients were admitted into that Hospital, and only seven so treated.

TEST FOR SUGAR IN URINE.—*L'Union Médicale* has given its readers long scientific details respecting the best method which the Practitioner can use for the purpose of ascertaining the presence of sugar in the urine of diabetic patients; and this conclusion is satisfactory, as it shows that the method in ordinary use is the best of all methods: "It is evident," the report says, in conclusion, "that for the ordinary use of Practitioners, the test by the aid of caustic potash, or by lime is sufficient. A glass tube, a spirit lamp, caustic potash, or a bottle containing milk of lime (*lait de chaux*), are all the articles necessary for the purpose."

PRIZE QUESTION.—The Société de Médecine de Marseille offers a gold medal, of 300 francs value, for the best essay upon the following subject, to be written in French or Latin, and forwarded prior to the 31st of July, 1860, addressed to the Secretary, M. Roux, 13, Allée des Capucins:—"Examine the action of Anæsthetics, considered as agents producing death. Next determine the circumstances under which they should be employed, the conditions which favour or prevent fatal accidents, and the therapeutical means by which these may be best combated."

THE CHOLERA IN GERMANY.—A letter from the Grand Duchy of Mecklenburg, in the *Augsburg Gazette*, says: The cholera has broken out with great violence in some towns and villages of this duchy, and many of the persons attacked have died after only four or five hours' suffering. In some of the villages the harvest operations have been suspended for want of hands, sixty to seventy persons having been taken ill at the same time. The disease breaks out first in one place and then in another, sparing for a time intermediate villages, and then turning back on them with increased violence. The ports of Rostock and Warnemunde have not escaped the malady which was brought there, it is supposed, by a vessel from St. Petersburg. The cholera continues to rage at Hamburg, carrying off from sixty to seventy persons daily.

SATURDAY, AUGUST 27.

THE SMETHURST CASE.

It is a disagreeable fact that in two of the trials for poisoning which have attracted the greatest interest in this country in modern times, the accused and convicted poisoners have been members of the Medical Profession. Palmer was a Member of the College of Surgeons; and Smethurst a Licentiate of the Apothecaries' Company, and Doctor of Medicine of Giessen. There may be some consolation, however, to those who follow out their Profession to its legitimate objects, in the reflection that both these men had long wandered from the ordinary paths of Medical life. Palmer took so early to the turf that he can scarcely be said to have practised; and Smethurst diverged into Hydropathy,—as after practising for some time at Stockwell and Camberwell, he went to Ramsgate, and after remaining there some years without success, he went to Gräfenberg, saw Priesnitz's practice, returned to try the water-cure at Ramsgate, and published a work entitled "Hydro-pathia." Then he established the Water-cure Institution at Moor-park, which he sold to Dr. Lane. For the last six years, according to his own account, he has been travelling about the Continent, and not practising. Still, it is too true, that both Palmer and Smethurst were Medical men. They obtained knowledge of the properties of poisons with the avowed object of relieving human suffering; and, if circumstantial evidence is to be trusted, they prostituted the knowledge so acquired to the basest of purposes.

These two trials are further especially interesting to our Profession, as it was upon Medical testimony that both the prosecution and the defence were chiefly founded. In neither case was direct evidence of fact produced. In both, evidence of circumstance, evidence of science, and evidence of opinion, contributed to satisfy the jury. The circumstantial evidence in both rested on the irresistible strength of a chain of events, explained simply and easily on the supposition of guilt, but hardly to be accounted for on the supposition of innocence. In both, the Medical and Scientific evidence was conflicting; but in both, the influence of authority, of scientific precision and exactitude, and the dictates of common sense, were against the accused.

The chief point in which the two cases differ, was that no poison was traced to the possession of Smethurst. In Palmer's case the purchase of the strychnine was a damning fact; but no arsenic, or antimony, or corrosive sublimate were found in Smethurst's possession. Even if they had been found in the possession of a Medical man, perhaps no great point could have been made of the possession, and it was impossible to do very much for his defence with the fact of their not being found, as the prisoner had the opportunity of disposing of anything he thought likely to be suspicious on the Monday night, when he was at liberty on his own recognisance, after his first arrest, even if he had not disposed of it some

days before, as soon as he saw that death was approaching—which it is quite clear he did from the tenor of his letter to his wife, and from his anxiety to get Miss Bankes's will made on the Sunday.

A great point of resemblance in the scientific evidence in the two cases is the fact that the poison to which death was attributed was not found in the body after death. The defence in both was, that if the death had been due to poison, some of the poison would have been found, and that the deceased died of some natural disease;—tetanus in the one case, dysentery in the other, being most in favour. No strychnine was found in Cook's body; no arsenic, and very little antimony, in that of Isabella Bankes. But the arsenic found in the evacuation passed by Miss Bankes three days before her death supplied a link wanting in the chain of evidence against Palmer.

Let us now, before entering on the discussion as to Smethurst's guilt or innocence as established by Medical opinion and chemical experiment, give a short account of the circumstances, which, when taken together, make up one of those strange stories of actual life in England in 1859, which, if produced in a novel, would be pronounced strained and unnatural, if not impossible.

All that we learn about Thomas Smethurst prior to his acquaintance with the deceased, in the evidence adduced on his trial—and it would be improper now to add to this—is that he is 48 years of age (a); that he married in 1828 a person much older than himself, now 74 years of age; that, according to his own account, he retired from practice six years ago and travelled about the Continent with his wife, living on his own independent property, his wife having none; and that they were living together in a boarding-house at Bayswater, from June to December 1858. In August, Miss Isabella Bankes, an unmarried lady in her forty-third year, went to reside at this boarding-house. Whether she had been acquainted with Smethurst previously did not appear; but the landlady soon noticed what she believed to be an improper intimacy between them, and gave notice to Miss Bankes that she must leave the house. Smethurst said he should leave too. The lady left on the 29th of November, and went to another Bayswater lodging; but Smethurst and his wife remained about a fortnight longer. On the 9th of December he and Miss Bankes met at Battersea Church, and were married, and two days afterwards took lodgings at Richmond, and resided together there as man and wife. Nothing was heard of them, with the exception of two letters written without an address by Miss Bankes to her sister on the 28th of January and the 15th of February, though they continued to live in lodgings in Old Palace-gardens, Richmond, as Dr. and Mrs. Smethurst. The deceased seems to have suffered frequently from nausea and "biliousness." Her sister stated that she had suffered from disease of the womb two years before, and had been in the habit of using injections. One of the Bayswater lodging-house keepers described her as "very delicate," and said her "appetite was very bad;" adding, "She frequently told me that when she attempted to take food she felt nausea." The mistress of the house where she stayed a fortnight before her marriage with Smethurst, described her as "very fragile;" but the mistress of the first lodging-house at Richmond, in which they resided from the 11th of December to the 15th of April, said she "appeared to be quite well" when they came, but "*became poorly*" about three weeks before they left, or about the 28th of March, when her fatal illness commenced. She then began to suffer from diarrhoea and sickness, which continued to be very distressing, and Dr. Julius was called in on the 3rd of April. The account of the subsequent Medical history of

the case will be found in our report of the evidence of Drs. Julius, Bird, and Todd. It will be observed that after a fortnight's attendance, Dr. Julius became convinced that some irritant was being administered to his patient. His partner, Mr. Bird, after a few days' attendance, at once adopted the same conclusion, when Dr. Julius mentioned his suspicions to him; and Dr. Todd, the very first time he saw the patient, and without receiving a hint from Dr. Julius, at once suspected poisoning. The fact that the only three Medical men who saw the patient when alive unanimously agreed in this respect, was very strong evidence; while Dr. Wilks, Mr. Barwell, and all those who examined the body after death, or only saw parts of it, were quite as unanimous in attributing the morbid appearances observed to the action of poison. It is rather singular that so many members of a Profession so apt to differ as we are should have been so united; and that of those Medical men who explained the symptoms and morbid appearances by natural disease, not one of them had either seen the patient or her body. They derived their information solely from the depositions of the witnesses whose opinions they were called upon to set aside as valueless.

But we have omitted to notice some of the circumstances of the illness, which independently of Medical evidence told their own story. Smethurst and his reputed wife were living alone in their first Richmond lodging when her illness commenced. They occupied only two rooms—two parlours communicating with each other—one being used as a bedroom, and the landlady said that Dr. Smethurst himself gave the patient all her food. She took arrowroot, sometimes corn-flour, sometimes beef-tea. "I could not say what was the effect, as I was never in the room when she took them. I took them into the parlour which communicated with the bedroom." The daughter of this witness said, "I always left the food in the parlour, and it was taken into the bedroom by Dr. Smethurst." Smethurst removed Miss Bankes from these lodgings on the 15th April, as the landlady wished to raise the terms from 18s. to 23s. a-week, and he took two rooms in another house in Richmond for which he agreed to pay 15s. a-week. Here the same system was pursued. The mistress of the house said:—

"Dr. Smethurst waited upon her. I prepared her food. I sometimes took it into the parlour, and sometimes to the bedroom door. Dr. Smethurst gave it to Mrs. Smethurst. The tray was afterwards brought down by Dr. Smethurst. All the evacuations were placed on the landing by Dr. Smethurst. All the slops were put into one pan, which I carried away. I told Dr. Smethurst that I would act as nurse. He said that I had enough to do in the house, and that he could not afford a nurse. He also said no one could do so well for her as he did himself. The bedroom was never thoroughly cleared out."

Then it appeared that although she constantly vomited what Dr. Smethurst gave her, an egg was given her by one landlady, some tapioca by another, some beef-tea by Mr. Bird, some arrowroot by the sister, and these things were not vomited. She often also complained of the "nasty taste" of what was given her. Then it was remarked that nothing was left of the things she partook of. Lodging-house keepers are apt to finish up what is left; but Smethurst allowed of no such liberty. On one occasion only was some rice taken away, and that he said was sour and must be thrown away. At length he wrote on the 18th of April, asking her sister to come and see her. She went, but "was never alone with her all the time, except for a minute, Dr. Smethurst being always present." She added:—

"I noticed some tapioca in a cup. My sister said it had a nasty taste, and that she would like me to make some. I offered to do so. The prisoner said the milk had not come. I afterwards proposed to make some blanc mange. He said he would rather I should not, as it would interfere with the landlady. He gave my sister some soda-water and a saline draught. The saline draught was white. He said it was to

(a) It has been asserted since the trial that he is 54 years of age; as in the year of his first marriage, 1828, he was a prisoner in Horseman-gallane Gaol on a charge of obtaining goods by false pretences. His age was then given as 24.

check sickness. He went outside and remained there a minute or two. He then came in and gave her the draught. She was sick immediately. He then gave her some milk. She was again very sick. I left at six o'clock. My sister said she wished very much to see me again."

But Smethurst wrote, making various excuses why the sister should not see her again, alleging that the excitement of seeing her might be injurious; yet, as the Chief Baron said, in the most impressive part of his charge,—

"At the very period when this unhappy woman was lying in agony and misery on her death-bed, and when, according to the prisoner's own statement, she was in such a condition as not to be able to bear the excitement of seeing her own sister, he took into her bedroom, on a Sunday, an entire stranger, an attorney, and there a will prepared by himself was read over to the unhappy woman, who executed it under the circumstances of degradation to which he had alluded, tacitly confessing to this strange man on that Sunday morning that she was not, as all believed, Mrs. Smethurst, but a spinster, one who had sacrificed all that is most prized by woman. He could not contemplate without a display of feeling for which he ought perhaps to apologise to the jury, this scene of suffering and privation, when this poor dying creature had all her relatives excluded from her, and an attorney was thrust into her presence, and she was allowed to pass into the other world without one word of religious consolation, as if she had been a beggar and an unbeliever in a heathen land."

To this painful story must be added the sum of the evidence adduced to explain the *motives* of the crime. They were fear and cupidity—fear of punishment for bigamy, and the bait of £1800 bequeathed by the will, in addition to £400, which the prisoner was insane enough to state in his own address, when called upon to say why judgment should not be pronounced upon him, "with bank receipts, and other things he had belonging to the deceased in his possession." The prosecution seem to have known nothing of this property. Sergeant Parry was very wisely silent about it; for, if the statement be true, it adds a most damning link to the chain of evidence in favour of guilt. All this led to the following very simple theory of the prosecution:—The prisoner decoyed a lady of property away from her friends, quelled her scruples by an illegal marriage, and slowly poisoned her, while acting the part of an extremely affectionate husband; but acting this part so badly that while he was in possession of so much of her money, and had a balance of £150 at his bankers, he moved her from one lodging to another to save five shillings a-week; refused her a nurse, because he could not afford it; kept her sister away to spare her feelings, while he introduced an attorney for his own purposes; and on the last day of her life entered into an unseemly squabble, refusing to pay for a nurse sent by Dr. Julius.—Our readers will see how very strongly this theory was borne out by a number of circumstances, each of apparently little importance when taken alone, but which, when taken with all the others, combine to produce a conviction of guilt almost irresistible.

The theory of the Medical defence may be stated as follows:—"A delicate 'fragile' woman, who had suffered from uterine disease and used vaginal injections—one of a family 'subject to bilious attacks'—herself the frequent subject of nausea and liable to occasional vomiting—marries at the age of forty-three. Between three and four months after marriage she becomes pregnant, and about the same time, or from five to seven weeks before her death, she begins to suffer from vomiting and diarrhœa, which become exceedingly obstinate. Effervescing draughts with prussic acid, astringents, grey powder, with Dover's powder, opiate, enemata, bismuth, acetate of lead and opium, nitrate of silver, and sulphate of copper are tried successively, and all prove useless, while some of them are followed by an aggravation of symptoms. This goes on from the 28th of March till the 2nd of May, when the patient dies exhausted. Post-mortem examination shows a condition of liver which

explains the bilious attacks, and a state of intestine closely corresponding with the ordinary effects of acute dysentery. The uterus contains an ovum of from five to seven weeks' development, and there are none of the special lesions of the mouth, œsophagus, stomach, or anus, which are looked for in cases of irritant mineral poisoning. No arsenic is found in the body, and only from a quarter to half a grain of antimony. As there was no arsenic found, it could not have been a case of arsenical poisoning; and the small quantity of antimony found might have been taken long previous to death, or been given unknowingly as an impurity in some of the metallic medicines administered. She could not have died of poisoning, therefore, while her death is explained in the simplest and most natural manner by the aggravation of the ordinary vomiting of pregnancy to be expected in a bilious delicate woman, who had suffered from uterine disease, and becomes pregnant for the first time at the age of forty-three."

It appears to us that if this line of defence had been properly worked out, the prisoner must have been acquitted. What did the jury care whether Dr. Taylor's theory of the elimination of arsenic by chlorate of potash was or was not correct? It was not pretended that any of the chlorate had been given to the patient, and the jury had nothing to do with it. It was thought necessary, however, to shake the confidence of the jury in Dr. Taylor; and one experiment was narrated with the view of showing that this theory of his must be false. But the experiment was so loosely conducted that the confidence of the jury was shaken, not in Dr. Taylor, but in the Medical witness for the defence, and in the Medical defence itself. A dog was given 18 grains of arsenic, and 365 grains of chlorate of potash in sixteen days. It was killed twelve hours after the last dose, and arsenic was found in the body. But the witness could not swear that even half-a-grain was found, and he had not estimated the quantity passed off in the excretions of the dog during the time it was subjected to the action of the poison. It was at once shown that if this one experiment proved anything—which it certainly did not—that it supported rather than upset the elimination theory. So with the other two experiments with antimony and arsenic, with and without chlorate of potash. They were conducted in a manner so open to cavil, that they were in the highest degree damaging to the scientific character of the defence. Then, as to the bismuth. One fact of immense importance was cited. Dr. Richardson stated that he found arsenic on Monday morning, in the urine of a patient who had only taken five grains of bismuth three times a-day from the previous Tuesday morning to Sunday night. He and Dr. Thudichum deposed that the maximum quantity of arsenic they had found in bismuth, was half-a-grain in an ounce, or 1 grain in 960. This patient only took ninety grains of bismuth, or less than one-tenth of a grain of arsenic, in six days. Yet arsenic was found in the urine. Believing this to be true—believing that the metallic substance he found was really arsenic, not bismuth—it seems incomprehensible that Dr. Richardson did not carry out an experiment which promised so well. No Medical man would object to take a few doses of bismuth, and examine his urine afterwards. There are patients attending at all our Hospitals who are taking much larger doses than those given to Dr. Richardson's patient. Nothing would have been easier than to collect a hundred observations in place of this one—but only one was narrated, and it fell valueless, because uncorroborated and open to doubt. Then the jury were mystified by accounts of infinitesimal proportions of impurities in grey powder and other drugs given to deceased—evidence utterly useless, as it was not attempted to show for a moment that any of these impure drugs had been taken by the deceased in sufficient quantity to account either for the arsenic found in her evacuation, or for the antimony found in her body. It seems too true that this

failure in the chemical and physiological experiments threw discredit in the minds of both judge and jury upon the character of the scientific evidence for the defence, and that the cogent reasoning of Dr. Tyler Smith and Dr. Webb, and the remarkable fact cited by Mr. Edwards, were not allowed their due weight.

The great point made by the defence was Dr. Taylor's mistake as to the bottle containing, according to his depositions before the coroner and magistrate, a solution of arsenic and chlorate of potash. The facts of the case, and Dr. Taylor's own frank avowal of his error, will be found in our report of his evidence and of that of Professor Brande and Dr. Odling. Notice of the mistake was given to the prisoner long before his second trial, but the argument was too likely to tell with the jury to be passed over: "If Dr. Taylor made this mistake with the contents of the bottle, may he not have been equally in error with the evacuation?" though not one of the witnesses for the defence attempted to show that any organic fluid would have the same effect upon the copper as the chlorate of potash.

The reply of the defence to the circumstantial evidence was that the conduct of the prisoner towards the deceased was really kind—that he waited upon her, gave her food, and nursed her out of pure affection—that the vomiting of the food he gave her, its "nasty taste," and her relish of the food given by others and not vomiting it, was pure accident, or the perverted taste of an invalid, that the will-making on the Sunday was in compliance with her own wish, and that no concealment was used with the Medical men. Then as to motive, there was no fear of an indictment for bigamy, for the old lady at Bayswater was a consenting party to the arrangement; and, as the prisoner delicately hinted in his last speech, it would have been a better plan to poison the lady of 74 who had no property, than the lady of 43 who had £200 a-year. Avarice again would have led him rather to keep alive a lady who was quite willing to give him the interest of £5000 annually; than to poison her for the sake of getting £1800, or only twelve years' purchase of this annuity, all at once.

The prosecution do not appear to have suspected the use of any vegetable or animal irritant. Yet the symptoms and morbid appearances very much resemble those produced by elaterium, colchicine, and savin; and they are not very unlike those produced by veratrum, and by croton-oil. They are inconsistent with what is known of the action of cantharides. It would be difficult to give savin secretly, as its taste is so peculiar; but colchicine, or elaterium in small quantities, and largely diluted, are almost tasteless.

We have now placed before our readers our own impressions of this remarkable case, received during an attendance of four days in court, and after a careful perusal of the evidence, and the addresses of the judge and counsel. It only remains to add a few words as to the justice of the verdict. And this impression may be given very briefly.

Is the prisoner guilty? We believe he is.

Was he *proved* to be guilty? Certainly not.

The balance of probabilities was against him, but there is a *possibility* that he may be innocent. Innocent men have been hanged upon circumstantial evidence as strong as that which led to Smethurst's sentence. The very possibility of such a judicial murder is so dreadful that, while retaining the conviction of the guilt of the prisoner, forced on us by a consideration of the whole circumstances of the case, and without a particle of sympathy for him personally, we should gladly strengthen by any means in our power the petition to Government not to carry out the irrevocable sentence of DEATH.

Another article must be devoted to the purely Medical and scientific questions raised by this case.

THE WEEK.

THE following is a summary of the chief doings of the Medical Council, as recorded in our last number. The Council will assist the College of Physicians of London in getting rid of the obnoxious article which stands at the end of the 47th clause of the Medical Act. The Council do not consider that the Licence of the Irish Apothecaries' Hall is equivalent to a Degree or Licence from a recognised University or College; and they state this for the benefit of the Director-General of the Army Medical Department, who it seems has an intention of recognising the aforesaid Apothecaries' certificate as a Licence to practise Medicine. On the 10th instant, the Council gave the Registrar a rap on the knuckles; their Committee "are sorry to be obliged to report that there is too much reason for the complaint that the Register has not been kept as it should have been," etc. The Registrar, in explanation, speaks of hurry and bustle, and first essay at registration. They then pass orders for better regulating the registration. They answer questions put to them by the Poor-law Board, respecting the value, as qualifications, of the Licences and Diplomas of different Colleges, etc. They also, on the 11th, attack the important question of Medical Education; but this year confine their attention solely to one point—that of preliminary education.

A Medical gentleman, in a Belfast journal, suggests, referring to the Medical Charities Amendment Bill:—

"That any attempt to improve or amend our Medical charities will be vain so long as the dispensary doctors are permitted to engage in private practice amongst the gentry and farming classes, at the very time when they ought to be attending to the sick poor alone, for which they are paid a fixed salary. The poor are often left to pine away and die, without medical aid or attendance whatever. No man can serve two masters at the same time; and we need scarcely expect that the dispensary doctor will pay much attention to the sick poor man if he happen to have a number of good rich paying patients on hand. The Medical officers in the army and navy are never allowed to attend to any private practice so long as they continue in the service, because they must be always ready to attend when required, or when called upon to relieve the sick or wounded soldier. So ought it to be with the dispensary doctors."

We think his suggestion is well worthy of consideration. If Poor-law Doctors were compelled to restrict their practice to Poor-law patients, their advice and services would of necessity be rewarded very differently from what they are at present.

The remarkable condition of the press in France at this time has just been illustrated by what has befallen one of the Medical periodicals which appear three times a week in Paris. Our readers will recollect that some time ago there was a discussion at the *Académie de Médecine*, upon M. Bouchut's proposition of passing a tube into the larynx in croup. The proposition was rather roughly handled by M. Trousseau and others; but freedom of speech is as yet tolerated within academical precincts. It is otherwise, however, in the journals; for on the appearance of a *jeu d'esprit* upon the subject from the pen of a Dr. Joulin, M. Bouchut took fire and brought an action for defamation. We have read the article in question (January 18th), and are quite at a loss which to consider most foolish,—the author for printing such trash and calling it wit, or the Doctor for taking notice of what we should laugh at here as excessively diluted *Punch*. However, so it was, and we have the edifying spectacle of a Practitioner pursuing his *confrère* with the terrors of the law, which, in this case, proved no vain terrors, inasmuch as M. Joulin, the contributor, and M. de Castelnau, the editor, have each been sentenced to a fine of £40 and

a month's imprisonment. This, according to the present legislation for the French press, entails the stoppage of the journal, which can no longer appear, at least, under the same title. It seems serious work editing even a Medical journal in Paris, for we recollect two or three years ago the same punishment fell upon the same editor for a somewhat similar cause, at the instance then of M. Briquet.

We find the following paragraph, headed "Strange Conduct," in the *Northern Daily Times*. It has been forwarded to us for publication by a correspondent. The whole affair, as here related, does indeed seem "passing strange." It is difficult to understand whose conduct in the matter is most strange. One man, Mr. Dyke, supplies certificates of death, it would appear, *ad libitum*, to a druggist; sometimes handing them over signed in blank to save trouble. The Coroner, again, does not, according to this report, make any comment upon such an outrageous proceeding. The Surgeon, also, who makes the inquest, seems to have arrived at a queer conclusion. He finds the cause of death to be purely natural; and yet affirms that the medicine—a few drops of aromatic spirits of ammonia—was not proper, and would tend to increase the disease. The whole affair is too strange for us to deal with.

"STRANGE CONDUCT.—An inquest was held yesterday before P. F. Curry, Esq., Coroner, on the body of a young woman named Margaret Toole, who resided at 2, Court, Marybone, up to the time of her death. On Friday night the deceased was brought home by an acquaintance, when she was complaining of a pain in her stomach, as she had frequently done during the last eighteen months. She still continued to complain all night; and on Saturday Mr. John Walker, druggist, 34, Marybone, was sent for. He refused to attend till he would be paid one shilling and sixpence; and, after that amount had been paid, he visited the deceased, and sent her a bottle containing medicine. She died about ten minutes after taking the first dose. The medicine was composed of one ounce of peppermint water, and ten drops of aromatic spirits of ammonia. When applied to, he gave a certificate of death, which was signed by Mr. Dyke, Surgeon, Great Homer-street, who, however, had never seen deceased since or before her death, and the cause of death was said to be disease of the heart. He had given similar certificates for Mr. Walker on three or four occasions, though he had never seen the patient. In the case of a child, who died four or five weeks ago, Mr. Dyke supplied Mr. Walker with the certificate in blank form, with his signature attached, and Mr. Walker filled it up. Mr. Ayrton, Surgeon, said he made a post-mortem examination of the body in this case, and found the cause of death to be purely natural. The mixture given by Mr. Walker was not a proper one for the complaint of which the deceased had died. It would tend to increase the disease. The heart was perfectly sound."

We are happy to find that a preliminary meeting has been held, and proceedings commenced, towards the formation of a Medical Registration Society for Birmingham and the Midland Counties. All the speakers united in admitting the great advantage of being furnished with a list of the impostors who impose upon the public by assuming titles to which they have no legal right, and inflict upon the deluded sufferers incalculable loss. This object should be steadily kept in view by these Societies. They must not degenerate into prosecuting Societies for the mere protection of Professional interests. The nonsense talked lately by the magistrates about the interested motives of Medical men in prosecuting quacks cannot be corrected too soon. It is the public we protect, not ourselves. We do not sell alum and urine at fabulous prices as a certain cure for incurable deafness. The public is not cheated by respectable members of our body, and it is for the national good, not for individual benefit, that the public should know who are legal practitioners, and who are illegal pretenders.

PROGRESS OF MEDICAL SCIENCE.

Selections from Foreign Journals.

ON THE CHLORATE OF POTASH.

By Dr. FOUNTAIN.

DR. FOUNTAIN states that he became acquainted with the remarkable power exerted by this highly oxygenated salt in mercurial salivation in 1857, and consequently long before this had been observed by Herpin and others. In charge of the Hospital of the Panama Railroad Company at Aspinwall, he often met with ptyalism in consequence of the free use of mercury, the peculiar type of disease met with on the isthmus rendered necessary. Finding the various local applications of little avail, and recollecting Dr. West's recommendation of the chlorate in stomatitis of children, he gave in a bad case twenty grains every three hours, besides using it also as a wash. The effect was almost magical, and subsequent experience has only confirmed its efficacy. And Dr. Adler, engaged in the same service, says:—"Such has been the uniform success following the administration of this salt, that from my own experience I consider it as a specific. It has never failed." In some cases where mercury had to be given for a long time, and danger of ptyalism was feared, it has been given as a prophylactic, and, as Dr. Fountain believes, with good effect. Dr. Fountain also gives an account of the advantage he derived from the use of the chlorate, in Iowa, when, owing to a deficiency in the supply of vegetables, and poor persons living on salted meat, and the cheapest food, a mild form of land scurvy broke out—the manifestation of the disease being confined to its local effect on the gums, without the production of constitutional symptoms. Recovery rapidly took place under its use, even when the diet remained unchanged. In ulcerative stomatitis he has never known the salt to fail.

The author's chief object, however, is not to add illustrations to facts already known, but to call attention to a practical application of the chlorate not yet much noticed. It is as an *oxydising remedy*, capable of coming to the aid of the respiratory process; and of stimulating secondarily the function of absorption, that its agency acquires a vast importance. This was first exemplified to him in a case of cyanosis from heart-disease, in which the blue colour was remarkably removed during the employment of the chlorate; and two cases are also given, one in which respiration was impeded from effusion of blood into the thorax from a wound of an intercostal artery, and the other an example of excessive dyspnoea from hydrothorax—in both of which the recovery seemed to be due to the use of the chlorate, which "supplied the blood with oxygen sufficient to sustain life during the time when respiration was seriously impeded." In a case of pneumonia typhoides, in which the imperfect aeration of the blood was the combined effect of an asthenic fever and a local engorgement of the lungs, the same benefit followed its administration. "The chlorate may answer another and valuable purpose in *promoting absorption*. It readily parts with its oxygen by the influence of a moderate degree of heat, or a weak acid; both of which exist in the body in sufficient amount to effect the decomposition to a greater or less extent. This is the theory; and practical confirmation has been made by the cases herewith reported. If by increasing the amount of oxygen in the blood, we enhance its power of removing deposits, then do we have in the chlorate another property of extensive application and great practical utility. It would render it doubly applicable to all cases where respiration is impeded by effusion within the chest of liquids or solids requiring decomposition for absorption, such as hæmatothorax, empyema, and the hepatized stage of pneumonia. As most of the products of inflammation consist of protein compounds in some form or combination, the addition of one or two equivalents of oxygen render them soluble by conversion into the deut-oxide or tritoxide, and permits their absorption by endosmosis into the adjoining vessels. Even tubercular deposits are known to consist principally of protein compounds; and we all know that the most effectual means of retarding or preventing their development consists in active out-of-door

exercise in the pure air of the country, by which the system is more freely supplied with oxygen, and the effete products of interstitial decay more rapidly removed."

"The chlorate of potash has been quite generally used as one of the favourite remedies in *scarlatina*. I think that it is justly so regarded, and has fallen into some disrepute of late by the error of depending too much upon its unaided influence. It has generally been given with the idea, that in chlorine, something like a specific or antidote had been found for the poison of the disease. Now, in truth, the chlorate is a very valuable remedy for meeting particular indications in the treatment of this disease; by arresting the ulcerative inflammation of the fauces, and by its arterialising properties, supporting the recuperative powers of nature when aided by other appropriate treatment. In this connexion I will state, that I have been in the practice of late of giving it in combination with carbonate of ammonia, with the best effects. Other aids must vary according to circumstances; but I will mention two which I have found of great value in almost all cases, the application of pure nitrate of silver to the fauces, and of glycerine to the whole surface of the body. Some considerations induce me to think that it is not the chlorine, but the liberated oxygen which constitutes the chlorate a remedy of value in *scarlatina* and kindred diseases."—*New York Journal*, July, pp. 1—27.

GENERAL CORRESPONDENCE.

FAILURE OF HOMŒOPATHIC VACCINATION.

LETTER FROM DR. DRUITT.

[To the Editor of the Medical Times and Gazette.]

SIR,—Last week I vaccinated two children, aged respectively three and one years, who were born in New Zealand, and have just arrived in this country. The point of interest is, that these children were vaccinated homœopathically at their place of birth; which operation consisted in making them swallow some globules which were alleged to contain vaccine matter. They were afterwards inoculated with some matter said to be taken from a cow, without any effect; and the failure of this operation was assumed to be a proof that the previous swallowing of the globules had rendered them proof against any further dose of the vaccine poison.

This theory was set at nought, however, by the fact, that my vaccination produced the most perfect vesicles; thus showing that the children were utterly unprotected from that poison, and from small-pox.

I have thought it worth while to make this the subject of a short communication to you, to show, as a matter of fact, the worthlessness of this homœopathic practice. On what experimental evidence, such a proceeding has been adopted, I know not; but unless there is such evidence in existence (which I do not believe), the persons who resort to it ought to be punished for fraud.

It is worth noticing, too, that every eruption in the cow is not cow-pox; and that, as a general rule, it is safest to get the vaccine matter from a healthy child, than to resort to the dairy.

I am, &c.

R. DRUITT.

57, Hertford-street, W. August 22.

USE OF SOLID PERCHLORIDE OF IRON.

LETTER FROM J. ZACHARIAH LAWRENCE, ESQ.

[To the Editor of the Medical Times and Gazette.]

SIR,—A few months ago I drew the attention of the Profession to the powerful local styptic properties of the *solid* perchloride of iron. I have since that time used it with the best effects, and, moreover, have the satisfaction of knowing through the manufacturers of this substance (Messrs. Hopkins and Williams, of New Cavendish-street), that since the appearance of my letter it has been in frequent demand by the Profession generally for the purposes indicated.

Since then I have found a superior method of employing it. If the solid perchloride of iron be kept in a bottle, a small portion of it after a time deliquesces into a thick brown fluid,

which is constantly kept in a state of super-saturation by the undeliquesced portions of the salt. This liquid, applied by means of a spun-glass brush to a bleeding surface arrests the bleeding almost instantaneously. This mode of application is particularly valuable in applying the styptic to such cases as excision of the tonsils, bleeding from the deeper-seated gums, &c. I may further remark that I have never noticed any inflammatory action following the use of the solid perchloride.

I am &c.,

J. ZACHARIAH LAWRENCE.

REPORTS OF SOCIETIES.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

F. C. SKEY, Esq., President, in the Chair.

A Paper by CONWAY EVANS, M.D., was read, on

TRACHEOTOMY IN CROUP.

The author commenced by remarking upon the frequency and fatality of croup as a disease of early life, in illustration of which he observed that out of every thousand deaths of children between the ages of one and ten years, which occurred in England and Wales during the year 1856, sixty were due to this malady. He then proceeded to examine into the rate of mortality from croup, and pointed out the very slight measure of success which has hitherto attended the methods of treatment usually employed in this disease. The following cases—four of croup and two of diphtheria (?)—in which tracheotomy was performed, were then narrated in detail:

Case 1.—A boy, aged 9; attacked with croup of slow accession; temporary amendment in the symptoms, followed by threatening suffocation; tracheotomy; death four hours after the operation; existence of croupous exudation down to the second and third subdivisions of the bronchi.

Case 2.—A girl, aged 3; croup treated by leeches, counter-irritation, tartar emetic, and calomel; tracheotomy on the fifth day, asphyxia being so complete as to render artificial respiration necessary; ejection of false membrane from trachea, and likewise two casts of small bronchial tubes; after-treatment of a freely supporting character; recovery perfect.

Case 3.—A boy, aged 2; croup, between two or three days, treated with emetics; tracheotomy on the third day, suffocation being nearly complete; death during the operation; the croupous exudation found after death to extend down to the first subdivision of the bronchi.

Case 4.—A boy, aged 2½; croup treated by tartar emetic; suffocation imminent on the fourth day from the accession of the croupous breathing; tracheotomy; death from exhaustion sixty-five hours after the operation; false membrane found after death to extend down to the fourth subdivisions of the bronchi.

Case 5.—A boy, aged 5; diphtheria (?) coming on slowly and insidiously; breathing croupous on the seventh day; treated by emetics, counter-irritation, calomel, and compound antimonial powder; suffocation imminent on the eighth day; tracheotomy, followed by supporting treatment; ejection of a piece of false membrane; sudden accession of severe diarrhoea about thirty-six hours after the operation, and death from exhaustion. No post-mortem examination.

Case 6.—A boy, aged 10; diphtheria coming on very insidiously during nearly a month; treated by salines, and the application of a solution of nitrate of silver to the throat; supervention of croupous symptoms, treated by counter-irritation, leeches, antimony, calomel, and chlorate of potash; asphyxia impending; tracheotomy, and stimulating after-treatment; death, apparently from syncope, about twenty-six hours after the operation. After death a thick false membrane, separable from the subjacent mucous membrane only with considerable force, was found to line the larynx and trachea, and to extend to the bifurcation of the latter. It probably, indeed, passed down into the lungs; but an examination of these organs was not permitted.

Observing that, as in a large proportion of the fatal cases of croup, the disease destroys life by asphyxia, the author proceeds to inquire into the reasons why tracheotomy is so rarely resorted to for the relief of this malady in Great Britain, and traces this mainly to the influence of the strong opinions against the operation which have from time to time been pronounced by many great authorities, both British and American, whose views in reference to this point are cited. These opinions the author believes have no valid foundation, and are unworthy of the confidence generally placed in them; and to this conclusion he is led from four classes of considerations, which are examined in detail. These are—1st, the high rate of mortality from croup, both with and without treatment; 2nd, the immediate cause of death in a large majority of the fatal cases of the disease, viz., asphyxia; 3rd, the recorded cases of croup in which tracheotomy has been resorted to in this country when the patient has been all but suffocated, and in which complete recovery has followed the operation; and 4th, the great success which has attended the performance of tracheotomy in croup in France, in which country it has been extensively practised. If to each of these considerations its fair value be assigned, there can scarcely be any other conclusion but that it is incumbent upon the practitioner to give a fair trial to any method of treatment in croup which promises for its results a lower rate of mortality than obtains under the usual plans, and especially to tracheotomy.

The objects to be gained by the performance of tracheotomy in croup are next pointed out, stress being laid upon the fact that the operation affords time for the disease to run its course (which would frequently not involve the destruction of life, except for the occurrence of asphyxia, which ought really to be regarded as a circumstance in the disease in a great measure accidental), and for the administration of such remedies as may be deemed advisable. The physiological effects of the free admission of air into the lungs through an opening in the trachea in a child undergoing suffocation from croup, are then considered, and the immediate cause of death in those cases in which life terminates by asphyxia is also examined; the practical conclusion arrived at being that, while the symptoms of suffocation may be relieved in almost all cases by the late performance of tracheotomy, they may be prevented in many by recourse being had to that proceeding early in the course of the malady. The principal objections which have been urged against the performance of tracheotomy in croup are then considered in the following order. Tracheotomy in croup has been objected to:—*a.* As unnecessary when there is spasmodic closure of the larynx, and as useless when false membrane exists in the windpipe without such spasmodic closure. *b.* As useless when the false membrane extends below the point at which the opening into the trachea would be made, and especially when the croupous exudation passes down into the bronchial tubes. *c.* As tending in itself to induce bronchitis and pneumonia—diseases which in themselves involve considerable risk to life. *d.* As having been actually attended with so little success as practically to render the operation unjustifiable. *e.* As very difficult of performance, and as involving in itself great danger to life. The real value of each of these objections is then carefully and fully examined in the order above given, the answer to the first objection being illustrated by the following case:—

Case 7.—A girl, aged 3; croup treated by the warm-bath and by tartar emetic, in spite of which the case progressed from bad to worse until the third day, when, while symptoms of asphyxia were being gradually developed, and signs of exhaustion were becoming well-marked, the patient suddenly fell back in bed and died with scarcely a struggle. After death, but before the post-mortem examination, tracheotomy was performed. A mass of false membrane was found, almost filling the larynx and quite occluding the rima, and extending downwards to the third ring of the trachea; but the lowest part of the croupous exudation was just above the top of the tracheotomy incision. No false membrane existed in any other part of the trachea. The results of tracheotomy for the removal of foreign bodies from the air-passages are then investigated, as well as those of the performance of this operation for the relief of other maladies than croup. But, as the statistical method of examining this subject is believed by the author to be productive of an impression upon the mind of the practical Physician by no means so lasting as a narrative of the results of clinical observation, the following

cases in which tracheotomy was performed for the relief of other diseases than croup are given in detail:—

Case 8.—A man, aged 43, came under observation when nearly exhausted from distressed breathing, dependent on syphilitic disease of larynx (probably ulcerative); tracheotomy, followed by a supporting plan of treatment; recovery; but, though able to return to his occupation (a laborious one), unable to breathe without the tube eight months after the operation.

Case 9.—A gentleman, aged 72; nearly asphyxiated from spasmodic closure of the larynx, associated with some disease of that organ (probably of a malignant character); tracheotomy; recovery, as regards breathing; but, though living in a state of comparative comfort, unable to breathe without the tube nine months after the operation.

Case 10.—A man, aged 36; suffocation impending from œdema of glottis; tracheotomy, followed by a highly supporting plan of treatment; recovery complete and rapid; voice also perfectly restored.

Case 11.—A girl, aged 15; nearly suffocated from œdema of the larynx supervening upon chronic disease of that organ, associated with "*lupus non exedens*" of face, lip, and thigh; tracheotomy; recovery, but inability to breathe on the withdrawal of the tracheal tube two months after the operation.

Case 12.—A lady, aged 23; œdema of glottis supervening upon tubercular disease of the larynx: suffocation imminent; tracheotomy; temporary recovery, the patient continuing to live in a state of comparative ease for five months after the operation, when death resulted from exhaustion consequent on the full development of the pulmonary phthisis.

Case 13.—A woman, aged 23; œdema of larynx associated with syphilitic disease of that organ: treated by calomel and opium, in spite of which suffocation became imminent; tracheotomy, followed by supporting treatment; ejection of complete cast of bronchial ramifications of one lung; recovery complete, except as regards voice.

Case 14.—A girl, aged 19; sloughing of the soft palate and the back of the pharynx, of syphilitic origin; inability to swallow; supervention of œdema of glottis, and threatening suffocation; tracheotomy, followed by supporting treatment; the patient being fed for several weeks by the stomach tube; recovery complete.

Case 15.—A boy, aged 3½ years; foreign body in windpipe; tracheotomy; but no foreign body discovered; incisions in trachea enlarged, and windpipe fully examined on several occasions, but without success; eventually incisions made, not only through several rings of trachea, but also upwards through both the cricoid and the thyroid cartilages, so that a finger could be readily passed from the trachea into the mouth, but still without the detection of any foreign body; ultimate recovery complete, and voice regained.

The conclusion deduced from all these considerations and facts is that tracheotomy, though frequently a difficult operation, is by no means so dangerous a proceeding as is commonly supposed. An inquiry is then instituted into the causes of the want of success which has attended the performance of tracheotomy in croup in this country, and this is attributed chiefly to the following circumstances, viz. 1st. To the fact that tracheotomy has been very rarely indeed resorted to in croup in Great Britain except as a last resort when other methods of treatment have been tried and found unavailing, and when the patient has become nearly asphyxiated. 2nd. To the fact that the treatment employed prior to the performance of the operation has almost always been of a more or less depressing kind, usually consisting in the exhibition of tartar emetic, ipecacuanha, calomel, the abstraction of blood, the use of the warm-bath, etc. 3rd. To the fact that the after treatment has generally not been of that supporting character which nature requires for the due upholding of the patient's strength until the phenomena of croup shall have had time to run their course; and to the difficulty experienced in commanding constant attention in the way of nursing and watching for some days after the performance of the operation. The author then strongly urges the propriety of having recourse to tracheotomy for the relief of croup early in the course of that disease, and immediately that the existence of false membrane in the windpipe can be satisfactorily determined, and emetics have been fairly tried; and for these reasons—(a.) Because tracheotomy tends to prevent the mode of death by which nearly all fatal cases of croup, in which this operation is not

resorted to, terminate, viz. death by asphyxia. (b.) Because tracheotomy facilitates the ejection and removal of portions of false membrane from the windpipe. (c.) Because tracheotomy tends to prevent the exhaustion due to the extraordinary efforts of breathing almost always made by the patient in this malady. (d.) Because tracheotomy, by prolonging life, affords time both for the phenomena of the disease to run their course and for the administration of remedies and of means of support to an exhausted system. (e.) Because tracheotomy facilitates the employment of topical applications to the interior of the windpipe, upon which great reliance is placed by some practitioners. (f.) Because the early performance of tracheotomy in France has been attended with results which are admitted, even by the opponents of the operation, to have been far more favourable than when recourse has been had to this procedure as an ultimate expedient. The physiological and pathological differences between the condition of a child nearly asphyxiated by croup, and that of a man half strangled by some mechanical cause, are then pointed out; and the necessity which exists in the former case for the free employment of a supporting plan of treatment is clearly proved. The cause of death in those cases of croup in which a fatal termination ensues, notwithstanding the performance of tracheotomy, is next examined, and this is shown to depend upon one or more of the following conditions: 1. On some accidental circumstance connected with the operation, such as hæmorrhage into the windpipe, obstruction of the tube, etc. 2. On asphyxia dependent on the extension of the croupous exudation into the lungs, or on the re-formation of the false membrane after its having been once ejected. 3. On complicating diseases (either connected with the operation, or without any reference to it) arising in the course of the croup, such as bronchitis or pneumonia. 4. On exhaustion—death by asthenia. The author believes that croup, when it proves fatal, always tends to destroy life by exhaustion, and that this would be its ordinary mode of termination were it not that the part of the body, in which the most striking alterations of structure induced by malady occur, is one in which the existence of such a mechanical obstruction as is presented by the croupous exudation tends, as well in itself, as in the spasmodic closure of the larynx with which it is often associated, to destroy life by suffocation before the disease has had time, as it were, to run its full course and produce death by asthenia. And he, therefore, strongly advocates the propriety of adopting a supporting plan of treatment in this malady both before and after the operation, but especially after its performance. The value of alcohol, as a remedial agent in the treatment of disease, is then examined, and the method in which it should be given, viz. in small doses at short but regular intervals, is pointed out. Alcohol should be regarded, as has been remarked by Dr. Todd, not as a specific remedy, but simply as a kind of food. It is really a hydrocarbon, very easy of digestion, possessing certain properties of enabling the body temporarily to withstand exhausting influences, and capable, by its undergoing oxydation in the system, of maintaining the animal temperature and of preventing waste of tissue. The *modus operandi* of the remedies usually employed in croup is then discussed, and their real value indicated; and the error of supposing this disease to consist in ordinary inflammation of the windpipe is alluded to. And, while the inefficiency of the remedies commonly used in croup is pointed out to be as theory would lead us to expect, the same fact is shown practically by the results of experience, which clearly indicate that under all plans of treatment, exclusive of tracheotomy, croup is a very fatal malady. The value of emetics is also examined, and the danger which frequently results from the employment of tartar emetic is dwelt upon. The circumstances which tend to diminish the chances of success from tracheotomy, are then referred to under the following heads:—a. The age of the patient; b. The existence of pneumonia or bronchitis; c. The presence of other diseases, such as measles, hooping-cough, etc.; d. The employment of depressing remedies prior to the operation; e. The postponement of tracheotomy until the patient is *in extremis*; f. The extension of the croupous exudation into the lungs. After suggesting a few practical hints in connection with the operation itself, and in regard to the inhalation of chloroform in these cases; and, after briefly glancing at the various points which have been examined in detail, the author thus concludes:—It only remains to warn the practitioner against ex-

pecting a large share of success from this operation, inasmuch as in our present inability to ascertain whether the croupous exudation is limited to a small portion of the windpipe, or whether it extends into the minute branches of the bronchial tree, we must necessarily oftentimes recommend its performance in cases in which death must almost inevitably take place. But, while a careful examination of this subject clearly indicates the propriety of making an opening into the trachea in those cases of croup in which false membrane exists, and of not postponing the operation until the last moment; and while it leads to the anticipation of a decided diminution in the rate of mortality from this disease when the early performance of tracheotomy is extensively practised; the student of science cannot but feel that tracheotomy is at best but an expedient of relief, capable by its mechanical action of obviating certain tendencies to death, and, by permitting the administration of support to an exhausted system, of affording time for the due occurrence of certain processes necessary to recovery. Nor can the practical Physician forget that some effectual remedy for croup has still to be searched for, and not to be found, in all probability, until the true ætiology and pathology of the disease are far better understood than at the present day. At the same time, it is impossible to foretell how near at hand the day may be, when there shall be found a man who will do for croup what Jenner did for small-pox, or when there shall be discovered a remedy for this malady, as certain in its power and as efficacious in its action, as is iodide of potassium in syphilitic periostitis, or as is quinine in ague.

A paper by GEORGE SOUTHAM, F.R.C.S., was read on

A CASE OF VESICAL CALCULUS OF UNUSUAL SIZE,

REMOVED BY THE RECTO-VESICAL OPERATION.

The patient, aged 21, was admitted into the Manchester Royal Infirmary with symptoms of vesical calculus, from which he had been suffering about sixteen years. On sounding him the stone was found to be of large size. He was emaciated almost to the lowest point compatible with life, unable to leave his bed, and suffering from a constant desire to empty the bladder, with severe pains in the loins and the lower part of the abdomen. The urine was loaded with pus, which on standing formed a thick white viscid sediment. It was highly ammoniacal, and a very considerable quantity of albumen was precipitated by boiling and the addition of nitric acid. Operative procedures were deemed inadvisable, until the hectic fever and great debility under which he was labouring were relieved. He was therefore placed on nutritious diet, with eight ounces of wine daily, and the bicarbonate of potash with opium, and large dilution with water, were given to allay the irritation of the mucous coat of the bladder. Under this treatment the patient's strength so much improved, that in a month the question of operation had to be entertained. Judging from the long period of sixteen years, during which the stone had been growing, the grave effects it was producing on the health of the patient, and from the more certain evidence of examination by the sound and the finger introduced into the rectum, I was convinced that the concretion was of large dimensions. The bladder had become so contracted by long inflammation, that only a few ounces of fluid could be injected into it; the general health was still precarious, and to crown the embarrassment there was still a copious deposit of albumen in the urine. The question that suggested itself was the following: did this indicate degeneration of the kidneys? If so, any thought of operation must be renounced. To the solution of this difficulty the microscope now afforded valuable assistance, and by this instrument the urine was repeatedly examined to discover whether any fibrinous casts of the uriniferous tubes were present: none, however, were found, nor any reliable indications of renal epithelia. And on the more accurate comparison of the quantity of pus and blood in the urine, with the amount of albumen precipitated by nitric acid and heat, the conclusion was come to that the albumen came from no higher source than the bladder itself, and was simply deposited from the liquor puris, and small quantity of blood always present in the urine. As the kidneys were considered not to be implicated, an operation was determined upon, and on the 17th of December the calculus was removed by the recto-vesical section. Chloroform having been administered, and about half a tea-

cupful of warm water injected into the bladder, a scalpel guarded by the finger was introduced into the rectum, and the sphincter and lower part of the anus completely divided. The urethra was opened anteriorly to the prostatic portion, and the finger passed through the wound into the bladder. As was suspected, the calculus proved to be of large dimensions. Accordingly, the wound in the prostate was enlarged. By means of the finger, the rest of the prostate and neck of the bladder were sufficiently dilated to admit a pair of forceps. On the introduction of the forceps it was found to be impossible to grasp with them so large a stone, as the contracted and indurated state of the bladder prevented the divergence of the blades. A scoop was now used, but with no better success: the stone could not be disturbed from its original position. Finding it difficult to lay hold of the calculus in the usual way, I had the screw of a straight-bladed forceps removed, that the blades could be separately introduced, one over and the other below the stone. The handles having been brought together and the screw reinserted, the calculus was grasped and slowly extracted, the operation occupying from ten minutes to a quarter of an hour. The calculus measured eight inches in circumference in one direction, and seven in the other. It consisted principally of triple and earthy phosphates, with a nucleus of lithic acid. It weighed 4 oz. 6 dr. and 25 grs. The patient had an excellent recovery; no constitutional disturbance of any amount followed the operation. The bowels were restrained in their action for a week by the administration of opium. Up to the 31st of December, all the urine passed by the rectum; it now commenced to come by the urethra. No inconvenience was at any time experienced from the passage of fecal matter through the urethra. The pus and albumen gradually diminished in quantity. The fistula was not interfered with until the 18th of February, when as some of the urine continued to pass through the rectum, it was examined. It appeared to be in the membranous portion of the urethra, and about a quarter of an inch long. It was touched once with nitrate of silver, and, subsequently, on two occasions the electric cautery was applied. He left the Hospital on the 28th of April cured, having for three weeks previously been free from all signs of the fistula, during which time he was engaged in assisting the nurses in the wards. Mr. Southam, in his remarks, did not advocate this operation except in especial cases, considering that the lateral method is the safest in the majority of instances. He was induced to resort to it in the above-mentioned patient on account of the presumed large size of the stone, the indurated and contracted state of the bladder, and the unsatisfactory state of the general health. After referring to the risks which attend the lateral method, where the calculus is of large dimensions, he alluded to the objections urged against the recto-vesical operation, the principal of which is its liability to the formation of a permanent fistula. This, he believed, might to a great extent be avoided, if the incision into the urethra were limited to only a part of the prostatic portion. He considered it would be seldom necessary to extend the excision through the neck of the bladder, experience having convinced him that the obstacle to the extraction of large calculi by the lateral method existed more in the surrounding structures than in the prostate, which readily yields to steady and cautious dilatation. In the case now related, there was abundant proof of this: indeed a calculus of much larger dimensions than the one described could have been extracted without difficulty by the same incision. He proposed to call the operation the recto-urethral.

PROMOTIONS OF MEDICAL MEN IN FRANCE IN THE LEGION OF HONOUR.—On the occasion of the recent *fêtes* at Paris, M. Flourens has been made Grand Officer, M. Velpeau, Commander, and MM. Vernois, Bérard, Dufour, Desmarres, and Devergie, Officers of the Legion of Honour. Twenty-four civil practitioners have also been appointed Chevaliers.

PALEONTOLOGICAL PATHOLOGY.—The Professor of Geology at Montpellier, M. Serres, informs us that he has found on fossil mammalia traces of pathological affections similar to those observed at the present day—exostosis, periostosis, etc. This seems to prove that there were diseases in the world before the days of Adam, and of course before Pandora's box was opened.

MEDICAL NEWS.

APPOINTMENTS.

The following gentlemen to be Honorary Physicians to Her Majesty:—Sir John MacAndrew, K.C.B. M.D. half-pay Inspector-General of Hospitals; Andrew Ferguson, M.D. half-pay Inspector-General of Hospitals; William Linton, M.D. C.B. Inspector-General of Hospitals; John Forrest, M.D. C.B. Inspector-General of Hospitals; James Brown Gibson, M.D. C.B. Inspector-General of Hospitals; Thomas Galbraith Logan, M.D. Inspector-General of Hospitals.

The following gentlemen to be Honorary Surgeons to Her Majesty:—Thomas Alexander, C.B. Director-General of the Army Medical Department; Alexander Melvin, half-pay Inspector-General of Hospitals; John Robert Taylor, C.B. Inspector-General of Hospitals; Edward Bradford, half-pay Deputy Inspector-General of Hospitals; Thomas Mostyn, half-pay Deputy Inspector-General of Hospitals; John Ashton Bostock, M.D. Surgeon-Major, Scots Fusileer Guards.

DEATHS.

BELL.—On July 27, at his residence, Robert John Bell, of Reedness, Yorkshire, M.R.C.S. Eng., L.S.A. 1836.

BENNETT.—August 22, at his residence, in Upper Sussex-place, Old Kent-road, Frederick Debell Bennett, M.R.C.S., aged 51.

CARNELL.—On August 7, in London, Clement John Carnell, of Tonbridge, M.R.C.S. Eng. 1859.

ELLIOTT.—On May 22, at Colombo, whither he had been removed from his residence at Kandy, Christopher Elliott, M.D., aged 49, Principal Civil Medical Officer of Ceylon. He was one of the oldest European residents in Ceylon, and was highly esteemed. The *Examiner* (a local newspaper) says:—"We do not recollect a funeral so numerously attended by all classes of the inhabitants. Including those which left the route of the procession, there must have been about 150 carriages."

FITZGERALD.—On June 29th, on board Her Majesty's ship *Cyclops*, in the Red Sea, Anthony J. Fitzgerald, Assistant-Surgeon, Royal Navy, second son of the late James Fitzgerald, Esq. of Lackendurra, County Waterford.

HAWKER.—On April 26th, at Clare, Australia, Thomas Drewitt Hawker, M.D. Justice of the Peace, aged 54 years.

HAY.—On July 22nd, John Alexander Hay, of Richmond-terrace, Hunter's-lane, Birmingham.

HILL.—On August 18th, at his residence, aged 69, Richard Hill, of Floregate-street, Worcester, L.S.A., 1826.

HUSBAND.—Recently, John Blake Husband, late House-Surgeon to the North Devon Infirmary, Barnstaple, Devon, M.R.C.S. 1855, L.S.A.

HUTCHINSON.—On August 11, at Croft-house, Ovingham, George Hutchinson, aged 49.

JOHNSTON.—On July 22, at his residence, Alta Vista, near Augusta, Georgia, United States, Walter Ewing Johnston, M.D., in his 42nd year.

MACHIN.—On June 14, at Sandhurst, Australia, Edwin Bourne Machin, aged 36.

MORTON.—On August 7, suddenly, while taking a walk, Edward Morton, of Hall Cliffe-house, Horbury, aged 60; M.D. Cambridge, F.R.C.P. London.

PERKINS.—On August 2, aged 63, Thomas Perkins, of Snaith, near Goole, Yorkshire, M.R.C.S. Eng. 1855, L.S.A. 1857.

READ.—Recently, Joseph Read, Assistant-Surgeon, Royal Artillery.

SEWELL.—On August 11, after a short illness, William B. Sewell, of Keighley, Yorkshire, aged 74.

TAYLOR.—August 20, at the Royal Hospital, Chelsea, Arthur Henry Taylor, Staff-Assistant Surgeon, late of the Royal Horse Artillery, K.L.H.

THOMPSON.—August 19, at Beaufort-buildings, East Bath, Dr. William Thompson, late of Newark, Notts, aged 60.

TILSLEY.—August 21, at North Petherton, Somerset, Horatio Nelson Tilsley, aged 61.

YELL.—August 18, after a lingering illness, William Henry Yell, Esq. M.D., O.D., of Leyden, for seventeen years resident Medical officer and Physician to Queen Adelaide's Lying-in Hospital, aged 54.

M. LONGET has been nominated Professor of Physiology of the Faculté de Médecine of Paris.

M. GEOFFROY ST. HILAIRE has informed the Academy, that attempts lately made of acclimatising the angora, the llama, and the yak, have entirely succeeded.

THE Registrar-General in his annual report states, that during the year, 318,194 persons were married, and that 663,071 births, and 419,815 deaths were registered. He estimates that the increase of the population of England and Wales exceeded 666 daily.

A COMMITTEE has been formed at Berlin, consisting of the most eminent men in every department of science, for the purpose of raising a fund, to establish a "Humboldt Foundation," as a perpetual memorial of their great countryman. The main objects of the Foundation are, the encouragement of philosophic research and of scientific voyages.

POLL ANGUS, a celebrated cow, the property of Mr. Watson, of Keilor, died lately at the age of 35 years and 6 months. She has had twenty-five calves. At 29 she ceased giving milk, and breeding; but she did not fall off in looks until two years ago, and only refused her food two days before she died.

MR. BOTALLA relates the case of a woman, in whom an abscess had formed in the right groin, which after suppurating gave exit to twelve lumbrici. The woman had always enjoyed perfect health, and recovered without suffering from peritonitis, or symptoms of perforation of the intestine, in the course of a few days.

DR. COMPÉRAT has got a cure for ascarides, which has never failed in his hands. It is a simple injection of water, containing five, ten, fifteen, or twenty drops of sulphuric æther, according to the age of the individual, and repeated more or less frequently, according to the number of the animals present. This agent, he says, has a double advantage. By its subtlety it readily enters into and destroys the larva; and by its antispasmodic powers it allays the spasmodic and nervous symptoms produced by the animals.

AMPUTATIONS.—We are told that, during the present war in Italy, amputations were practised under very favourable circumstances, and that they were much fewer than in former days. Formerly amputations were practised on the battle-field; but now-a-days they are only performed in the ambulances, after careful examination of the condition of the wounded person. Less Surgery as well as less Physic seems to be everywhere the order of the day at present.

BRITISH MEDICAL ASSOCIATION.—We have been requested to publish the following copy of a resolution proposed by Dr. Radclyffe Hall, seconded by Mr. Wolstenholme, and adopted at the annual meeting of the Council held in Liverpool:—"That the recent proceedings of the Edinburgh College of Physicians in the sale of their Licence, without examination, to gentlemen not already Physicians, was not called for to meet any want in the Profession and that, inasmuch as it tends to lower the status of the Physician, without elevating that of the General Practitioner, it is calculated in every way to prove injurious to the body of the Profession."

THE LATE DR. SWANWICK, OF MACCLESFIELD.—We extract the following from a local journal:—"Our obituary last week recorded the death of one of our townsmen, whose place amongst us will not easily be filled up. As a Physician of great talent and experience, Dr. Swanwick was deservedly held in high estimation; his profoundly accurate judgment and discrimination were appreciated both by his Medical brethren, and those who obtained the advantage of his professional advice. As a magistrate, Dr. Swanwick devoted much time and labour to the service of the public, both on the County and the Borough Bench; and his eminent abilities having been directed to the theory of the law, which a Justice of the Peace is called upon to administer, his thorough acquaintance with the subject caused his

opinions always to have great weight with his brother magistrates; while his decisions on matters of evidence were uniformly marked by ready discernment, firmness of purpose, and inflexible impartiality. The deceased was in the 69th year of his age. He filled the office of Mayor of Macclesfield in the year 1837; and about the same period was appointed one of the magistrates for the county. We are gratified to learn that Dr. Swanwick has made the handsome bequest of £1000 towards the endowment of the projected Infirmary for the benefit of the poor and afflicted of the town of Macclesfield."

EXTRAORDINARY LUNACY CASE.—A commission *de lunatico inquirendo*, which lasted five days, was concluded on Wednesday afternoon at the Castle of Exeter. The commission was opened on Friday last, before Mr. Commissioner Warren and a jury composed of country gentlemen. The petitioner was Dr. Greenup, of Warrington, in Lancashire, and the lunatic was Miss Phoebe Ewings, an old lady of 80 years of age. Mr. M. Smith, Q.C., and Mr. Karslake were counsel for the petitioner; and Mr. Collier, Q.C., Mr. Cole-ridge, and Mr. Kingdon were counsel for Miss Ewings. The facts, which were of an extraordinary character, were briefly these:—In the year 1853 Miss Ewings' sister died, and the bereavement much affected her mind. She was afterwards known to moan and to wander in a disconsolate manner through the streets. In October, 1858, she was attacked with paralysis, from which she physically recovered; but it was alleged that her mind was entirely broken down. Shortly afterwards she had an attack of mania, and was confined in Haydock Lunatic Asylum. Here she was said to have delusions and morbid aversions; she said that an attempt had been made to strangle her, and that while in the asylum an attempt was made to convert her to Roman Catholicism, etc. Some of her friends, believing that she would be better if removed to a private residence, took her out of the asylum, and the Rev. H. T. Ellacombe, her third cousin, who believed himself the next of kin, brought her to Exeter, and placed her in lodgings with a Miss Cousens, with whom she had formerly lodged. Dr. Shapter, a physician of considerable eminence, having attended her before, was called in, and he saw the old lady almost daily. He appeared to have acquired great influence over her, for a short time ago he, at her request, took instructions for a will, in which she gave several legacies, and made the doctor the residuary legatee. The amount of the legacies was 1,000*l.*, and the remainder of her property amounted to 13,000*l.* A will was made from these instructions, but was subsequently torn up, and another will, prepared by Mr. Gray, solicitor, of Exeter, was made, in which the bulk of the property was left to Dr. Shapter, and, in the event of his death, to his eldest son, and the rest of his children. Dr. Shapter, however, immediately wrote to Mr. Beaumont, Miss Ewings' solicitor at Warrington, stating what the old lady had done, but declaring most emphatically that neither he nor his children should ever take a single farthing under the will, notwithstanding that he thoroughly believed her to be in a sound state of mind and quite capable of executing a will. This Dr. Shapter put in writing, and communicated to several gentlemen, but failed to inform the Rev. H. T. Ellacombe of it, as he had promised to do. It was contended by the counsel for the petitioner that this declaration of Dr. Shapter was a proof that he did not consider Miss Ewings to be of sound mind. Several witnesses were called, who stated that Miss Ewings was of unsound mind. In answer to the petition, it was contended, and deposed to by several witnesses, that Miss Ewings had fully recovered from her attack of mania; that, allowing for the feebleness of old age, she was a lady of average intelligence, of good memory and powers of observation; and that with regard to her bequest to Dr. Shapter, she persisted in making it, saying that she had no relatives that she cared anything about, that none of them had ever taken any interest in her, and that with regard to the petitioner, who had recently discovered himself to be the next of kin, her family had had a lawsuit with his, and that therefore she much disliked him. Dr. Shapter was examined, and positively stated that he would never take any benefit under the will. The Commissioner and jury had an interview with Miss Ewings, and the latter unanimously pronounced her of unsound mind and incapable of managing herself and her property. The case has created the utmost excitement in Exeter and the neighbourhood.

TO CORRESPONDENTS.

Dr. Stone's case of Chorea shall appear in an early number.

House-Surgeon.—Write to the Registrar, Soho-square.

Mr. Stokes.—The pamphlet appears so perfectly nonsensical, that it seems to be beneath notice.

M. should address his question to the Director-General of the Army Medical Department.

B.—The infanticide connected with burial clubs shall receive our early attention.

An Anxious Inquirer.—1. If the two gentlemen are on friendly terms, it would be the proper course to allow the usual attendant to charge for the neighbour's visit. 2. The case should certainly be given over as soon as the usual attendant arrives.

Mr. Tiffen.—The question is so much more a legal than a Medical question, and so much depends upon the exact words of the contract, that we do not feel justified in offering an opinion.

M.B.—Suicides and suicidal attempts have been of late very numerous in London. A little girl at Islington, a few days ago, eleven years old, on being scolded, at once threw herself into the water at the gas foundry, and was drowned.

M.P.—The Registrar-General's returns of the past week show that deaths are slightly on the decrease in the metropolis, but that the public health is still in an unsatisfactory condition.

Mr. Butler.—M. Roux, Professor of Botany at Rochefort, has since 1851 given much attention to the cultivation of the Poppy. He is satisfied that the plant may be so cultivated in France as to produce an abundant supply of opium, and even so abundantly as to be exported to China. Let *perfidie Albion* tremble for her commerce!

A Student, Mr. J. H. Wells, and several other correspondents have asked: What the Council mean by the "*beginning of Professional Study*?"—In reply we can only state our own impression that when a pupil is articulated to a registered Practitioner the professional study begins; but the Council should be required to state distinctly what they mean.

M.D.—We understand that Mr. Knowles is the son of a respectable deceased Practitioner, and is himself qualified; therefore there is no excuse for the following advertisement, copied from the *Cambridge Chronicle*:—"Diseases of the Eye. Mr. Knowles, Surgeon Oculist, may be consulted upon all such cases daily, at his residence, Priory Grange, Newmarket-road, Cambridge. At home from nine to eleven o'clock."

THE DOSE OF HYDRARGYRUM CUM CRETA.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Has Dr. Thudichum embraced Homeopathic opinions and principles, or is the Medical Profession labouring under an error with respect to the quantity of Hydrargyrum cum Creta proper for administration to children? In his evidence for the defence of Dr. Smethurst, Dr. Thudichum "regretted to say that grey powder was a medicine constantly given to children in doses of from half-a-grain to three or four grains;" whereas a twelfth of a grain was in his opinion, sufficient. Now, being a Medical Student, and having recently attended a course of lectures on *Materia Medica*, I read such a statement, issuing from him, with surprise, —from one to five grains for children, and from five grains to half-a-drachm for adults, being, as I was instructed, the ordinary doses. I have referred to the works of Christison, Thompson, Phillips, Royle, Garrod, and others, all of whom are, I believe, deservedly acknowledged authorities on the subject; and in no case do I find even the minimum dose recommended less than one, and in some of them I find it is two grains. What, then, are

myself and others,—and when I say others, I think I may include nine-tenths of the Medical Profession throughout the United Kingdom,—to understand by the above statement of Dr. Thudichum?—That it is constantly given to children, and that, in the doses he speaks of, no one will attempt to deny, it being more frequently employed, probably, than any other therapeutic agent we possess, for the various disorders, sympathetic and others, so incidental to infancy and childhood.

That experience has satisfactorily confirmed the impression of its usefulness, will, I think, be generally admitted; and it must also be acknowledged that the quantity usually prescribed in such cases largely exceeds the circumscribed limits laid down by Dr. Thudichum. Such being the case, I naturally feel anxious to hear what explanation Dr. Thudichum has to offer for such a public, and, so far as I am able to judge, unnecessary expression of regret, which amounts to no less, than a wholesale condemnation of the practice of the entire Medical Profession. Even allowing, that he succeeded in discovering traces of antimony and arsenic in the grey powder that he analysed—is it on that account to be assumed that all grey powder is similarly adulterated? I believe that in ninety-nine out of a hundred specimens of the Hydrargyrum cum Creta, of commerce, Dr. Thudichum would fail to detect even a trace of the poisons alluded to; mercury, nor chalk, seldom if ever containing them as impurities. If the learned lecturer on Chemistry at the Grosvenor-place School of Medicine can prove that his opinions on this subject are correct, and consequently, that the doses of Hydrargyrum cum Creta, so long and still prescribed, are injurious and unnecessary, he will deserve, and doubtless receive the gratitude of the present and future generations of his Profession. Taking into consideration the many diseases in which this drug is employed, and the fact which has been ascertained, that children are less susceptible of its influence than adults—it will be admitted, that this is a subject of no trivial importance; and equally applying, as it undoubtedly does, to the other preparations of mercury, deserves the serious consideration of the Profession; for we cannot but presume that Dr. Thudichum would not so publicly have given expression to such remarks, without having important reasons for believing them to be correct.

I suspect that I am not the only one who will feel anxious to hear what he has to say on the subject; and also to know whether he believes all bismuth to contain such a quantity of arsenic, as to render it advisable to expunge it, another of our most useful and valued remedies, from the list of *Materia Medica*. I am, &c. J. P.

WHAT IS A LEGAL QUALIFICATION TO PRACTISE MEDICINE?

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I have read the report of the Committee of the Medical Council appointed to consider the communication made by the Poor-Law Board to the General Council as to the exact extent and nature of the qualifications obtained by the holders of certain Medical Degrees and Licences, but am greatly disappointed to find so little information upon the subject. I have been unable to satisfy myself what qualification is conferred by a Degree in Medicine, and am very desirous of having some authoritative statement upon this important point. On asking a legal friend, he tells me, in the words of the King's Bench in *West's case*, "testimonials from the Universities upon taking the Doctor's Degree have the nature of a recommendation, they may give a man a fair reputation, but they confer no right." And he says that the same language has been adopted by the judges in Scotland, who have said "that there is no reason to hold that the law of Scotland differs from that of England with regard to the privileges of the Universities, at least as to the effect of Degrees." Now, if such be the case, what qualification has the holder of a Degree of Medicine conferred by an English or a Scotch University? I wish very much some of your readers would answer this question. Parliament has, no doubt, enabled the holder of such a degree to register, and has also declared that he may, according to his qualification, practise Medicine in any part of her Majesty's dominions; but until his rights to practise medicine are ascertained and defined by some authorised declaration upon the subject, the Profession cannot know what value to attach to a Medical degree as a legal qualification to practise Medicine.

August 23.

I am, &c.

NOT AN "M.D."

COMMUNICATIONS have been received from:—
PROFESSOR SIMPSON; DR. COPLAND; DR. TAYLOR; DR. BABINGTON; DR. JULIUS; MR. BIRD; DR. RICHARDSON; DR. THUDICHUM; MR. BARWELL; DR. TYLER SMITH; DR. WEBB; MR. RODGERS; MR. CAUDLE; MR. P. CHAVASSE, Birmingham; DR. GILLESPIE, Edinburgh; DR. DRUITT; DR. BARKER, Bedford; DR. MORRIS; MR. USSHER; MR. LALLEMAND; MR. DONOVAN; MR. PEARSON; MESSRS. A. THOMPSON AND CO.; MR. BELCHER; MR. VERNON; MR. WRIGHT; MR. PHILIPS; MR. TIFFEN. Letters by DR. MORRIS, MR. USSHER, and DR. GILLESPIE, shall appear next week.

APPOINTMENTS FOR THE WEEK.

August 27. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

29. Monday.

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

30. Tuesday.

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

31. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m.; Orthopaedic Hospital, 2 p.m.; Middlesex, 12½ p.m.

September 1. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; London, 1½ p.m.; Great Northern, 2½ p.m.

2. Friday.

Operations, Westminster Ophthalmic, 1½ p.m.

Grosvenor Place School of Medicine.

No. 1, GROSVENOR PLACE (Adjoining St. George's Hospital).
WINTER SESSION, 1859-60.

LECTURES.

The INTRODUCTORY LECTURE will be delivered on MONDAY, OCTOBER 3rd, at Three o'clock, p.m., by Dr. COCKLE.
General Anatomy and Physiology—Dr. Richardson.
Descriptive and Surgical Anatomy—Dr. Halford and Mr. Lawson.
Chemistry—Dr. Thudichum.
Principles and Practice of Medicine—Dr. Cockle.
Principles and Practice of Surgery—Mr. Spencer Wells & Mr. Adams.
FEES.—General Fee to all the Lectures required by the Universities of London and St. Andrews, the Royal College of Surgeons of England, and the Society of Apothecaries, 35 Guineas.
Special arrangements may be made for any one of the Examining Boards.

Prizes and Honorary Certificates will be awarded for general proficiency at the termination of the Session.

The Microscope is used to illustrate the Lectures and Demonstrations.
The Dissecting Room and Museum of Anatomy are open to the Students during day-light, where their Studies are superintended by the Lecturers on Anatomy and Mr. Pittard.

The Lecturer on Chemistry has a Private Laboratory, where Students are instructed in Analytical and Physiological Chemistry.

Instruction in Pathological Anatomy is given by the Lecturer on Physiology.

Further information may be obtained at the School, 1, Grosvenor-place; or Dr. Richardson, 12, Hinde-street, Manchester-square, W.; or at the Residences of the different Lecturers.

Westminster Hospital School of

MEDICINE.—The INTRODUCTORY ADDRESS of the Session 1859-60 will be delivered by Dr. RUSSELL REYNOLDS, on MONDAY, the 3rd of October, at 8 p.m.; and after the Address a CONVERSAZIONE will be held, and the PRIZES of the past Session distributed.

The Westminster Hospital was Instituted A.D. 1719, and Incorporated by Act of Parliament A.D. 1836. It contains 175 Beds, and affords relief to about 20,000 Out-patients annually.

HOSPITAL PRACTICE.

Physicians—Dr. Basham, Dr. Fincham, Dr. Radcliffe.
Assistant-Physicians—Dr. Marcet, Dr. Reynolds.
Surgeons—Mr. Barnard Holt, Mr. Brooke, Mr. Holthouse.
Assistant-Surgeons—Mr. Hillman, Mr. Power.
Surgeon-Dentist—Mr. Clendon.

LECTURES.

Descriptive and Surgical Anatomy—Mr. Holthouse.
Practical Anatomy—Mr. Heath and Mr. Gray.
Dental Surgery—Mr. Clendon.
Chemistry—Dr. Marcet, F.R.S.
Surgery—Mr. Barnard Holt, and Mr. Brooke, M.A. F.R.S.
Physiology and Physiological Anatomy—Mr. Power.
Medicine—Dr. Basham.
Botany—Mr. Syme, F.L.S.
Comparative Anatomy and Zoology—Mr. Power.
Natural Philosophy—Mr. Brooke, M.A. F.R.S.
Materia Medica and Therapeutics—Dr. Radcliffe.
Forensic Medicine—Dr. Fincham and Dr. Reynolds.
Practical Chemistry—Dr. Marcet, F.R.S.
Midwifery—Dr. Frederic Bird.

Clinical Lectures.—In addition to the instruction given by all the Medical Officers during their visits, courses of Lectures on Clinical Medicine and Surgery, in accordance with the new regulations of the Examining Boards, will be delivered during the Winter and Summer Terms by the Physicians and Surgeons.

Clinical Assistants, Physicians' Clerks, and Surgeons' Dressers, are selected from the most qualified Students, without additional Fee.
The Entire Course of Study (including Hospital Practice and Lectures) required by the College of Surgeons and the Society of Apothecaries, may be attended on payment of Seventy Guineas.

Further information may be obtained on application to
F. J. WILSON, Secretary to the Hospital.

Queen's College, Birmingham.—

FACULTY OF MEDICINE.—The WINTER SESSION will open OCTOBER 3rd, 1859.

Anatomy—Professor Furneaux Jordan, M.R.C.S.
Physiology—Professor Waller, M.D., F.R.S., Physician to the Queen's Hospital.

Surgery—Professor Sands Cox, F.R.S., F.R.C.S., Senior Surgeon to the Queen's Hospital.

Practice of Medicine—Professor W. F. Wade, M.B., B.A., T.C.D., Physician to the General Dispensary.

Chemistry—Professor Bond, M.B., B.A. Lond., F.C.S., Physician to the Queen's Hospital.

Practical Anatomy—Under the superintendence of Professor Jordan and Dr. Walker.

Resident Medical Tutor—T. J. Walker, Esq., M.B. Lond., University Medical Scholar.

Clinical Medicine at the Queen's Hospital by Professors Alexander Fleming, M.D., Augustus Waller, M.D., and Francis Bond, M.B.

Clinical Surgery at the Queen's Hospital by Professors Sands Cox, Langston Parker, J. S. Gamgee, and J. F. West.

The College is situated midway between the Queen's and General Hospitals, and is open to the students of both.

The Junior Department in Medicine is open to students about the age of sixteen, and its studies are specially devoted to preparation for the Preliminary Examinations of the various Universities and Medical Boards, and to the acquisition of a knowledge of the elements of Anatomy, Chemistry, Botany, &c.

The Faculties of Arts, Law, Engineering, Agriculture, and Theology, will also resume at the same period.

For further information and Prospectuses, application may be made to the Honorary Secretary to the Medical Faculty, Dr. Bond, Queen's College.

King's College, London.—Medical

DEPARTMENT.—The WINTER SESSION, 1859-60, will commence on SATURDAY, OCTOBER 1, 1859, on which day all Students are expected to attend the Introductory Lecture, at Two o'clock.

The following Courses of Lectures will be given:—

Anatomy—Professor Richard Partridge, F.R.S.
Physiology; General and Morbid Anatomy—Professor Lionel S. Beale, M.B.
Chemistry—Professor W. A. Miller, M.D. F.R.S.
Principles and Practice of Medicine—Professor George Budd, M.D.
Principles and Practice of Surgery—Professor William Fergusson, F.R.S.

KING'S COLLEGE HOSPITAL.

Physicians... { George Budd, M.D. F.R.S.
R. B. Todd, M.D. F.R.S.
George Johnson, M.D.
W. A. Guy, M.B. F.R.S.
Lionel S. Beale, M.B. F.R.S. } With care of In-Patients.
With care of Out-Patients.

Physician for Diseases of Women and Children and Physician-Accoucheur—Arthur Farre, M.D. F.R.S.

Assistant-Physicians—Charles Murchison, M.D.; Conway Evans, M.B.

Surgeons... { W. Fergusson, F.R.S.
Richard Partridge, F.R.S.
William Bowman, F.R.S.
Henry Lee, F.R.C.S. } With care of In-Patients.
With care of Out-Patients.

Assistant-Surgeons—John Wood, F.R.C.S.; John W. Hulke, F.R.C.S.

Surgeon-Dentist—S. Cartwright, jun.

The Hospital is visited daily. Clinical Lectures are given every week, both by the Physicians and by the Surgeons. The Physicians' Assistants and Clinical Clerks, the House-Surgeons and dressers, are selected by examination from the Students of the Hospital.

SCHOLARSHIPS.—New Students will have the privilege exclusively of contending, in October, 1859, for five Warneford Scholarships—viz., two of £25 per annum, for three years, and three of £25 per annum, for two years. The Examination will commence on the 29th of September, in Divinity, Classics (subjects the same as for the Matriculation Examination this year at the University of London), Mathematics, History, and the Modern Languages.

One Scholarship of £40, tenable for two years; one of £30, for one year; and three of £20 each, for one year, will be filled up in April next, the subjects of the Examination being exclusively Medical.

Further particulars may be obtained from J. Harley, Esq., Sub-Dean of the Department; and a detailed Prospectus will be forwarded by application to J. W. Cunningham, Esq., Secretary.

R. W. JELF, D.D., Principal.

St. Thomas's Medical Session.—

A GENERAL INTRODUCTORY ADDRESS will be delivered by Dr. R. DUNDAS THOMSON, on SATURDAY, 1st October, 1859, at Three o'clock p.m., after which the Distribution of Prizes, &c. will take place.

Gentlemen have the option of paying £40 for the first year, a similar sum for the second, and £10 for each succeeding year; or £90 at one payment, as perpetual.

PRIZES AND APPOINTMENTS FOR 1859-60.

Voluntary Matriculation Examinations are held early in October, and Prizes are given in each of the three following divisions:—

1st. In Mathematics, Classics, and Ancient History. The President's Prize of 20 Guineas.

2nd. In Physics and Natural History. A College Prize of £20.

3rd. In Modern Languages and Modern History. A College Prize of £20.
To the three most distinguished Pupils for General Proficiency in each year, the following Prizes are awarded:—

FIRST YEAR'S STUDENTS.

1st. The Treasurer's Prize of 30 Guineas. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

SECOND YEAR'S STUDENTS.

1st. A College Prize of £30. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

The Dressers and the Clinical Clerks are awarded to merit, after examination.

THIRD YEAR'S STUDENTS.

1st. A College Prize of £30. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

Clinical Assistants, a Prize of £10, and £5 to the two most meritorious.

Mr. Geo. Vaughan's Cheselden Medal. The Treasurer's Gold Medal.

Mr. Newman Smith's Prize of £5 for the best Essay on "Neuralgia."

The two House-Surgeons, the Resident Accoucheurs, and the Dressers, are periodically selected, and are provided with rooms and commons in the Hospital, free of expense.

A Hospital Registrar, at an annual salary of £80.

Students of each year are classed according to their respective total merits in the examinations, and all of the First Class receive Certificates of Honour

MEDICAL OFFICERS.—Dr. Roots, Consulting Physician; Mr. Green Consulting Surgeon; Dr. Barker, Dr. J. Risdon Bennett, Dr. Gooden,

Mr. South, Mr. Mackmurdo, Mr. Solly, Mr. Le Gros Clark, Mr. Simon, Dr. Peacock, Dr. Bristowe, Dr. Waller, Mr. Whitfield.

Clinical Instruction is given at stated times by the Medical and Surgical Officers; and a systematic Course of Medical Clinical Lectures, by Dr. Barker.

Ophthalmic Surgery, Mr. Mackmurdo; Midwifery, Dr. Waller and Mr. H. Gervis; Dental Surgery, Mr. Patient; Medical Tutor, E. Clapton, M.D.

Lecturers on Clinical Medicine—Dr. Barker. Medicine—Dr. J. Risdon Bennett. Surgery—Mr. South. Physiology—Mr. Grainger and Dr. Brinton.

Descriptive and Surgical Anatomy—Mr. Le Gros Clark and Mr. S. Jones.

Chemistry and Practical Chemistry—Dr. R. Dundas Thomson. Midwifery—Dr. Waller. Practical Midwifery—Mr. H. Gervis. General Pathology—Mr. Simon. Botany—Dr. Bristowe. Comparative Anatomy—Mr. W. M. Ord. Materia Medica—Dr. Peacock. Forensic Medicine—Dr. Brinton. Public Health—Dr. Headlam Greenhow. Anatomical Demonstrations—Mr. Rainey and Mr. W. M. Ord. Demonstrations Morbid Anatomy—Dr. Bristowe and Mr. S. Jones. Microscopical Anatomy—Mr. Rainey.

Students can reside with some of the Officers close to the Hospital.

The Patients are admitted daily at Half-past Nine a.m., and the Out-Patients seen at the same time.

To enter, or to obtain Prospectuses and further information, apply to Mr. Whitfield, Medical Secretary, resident at the Hospital.

St. George's Hospital Medical School.

SESSION 1859-60.—The WINTER COURSE of INSTRUCTION will commence on SATURDAY, October 1st, with an INTRODUCTORY ADDRESS by Mr. H. C. JOHNSON, at 2 p.m., at the Hospital.

Physicians—Dr. Page, Dr. Bence Jones, F.R.S., Dr. Pitman, and Dr. Fuller. Assistant-Physicians—Dr. Barclay and Dr. John W. Ogle. Obstetric Physician—Dr. Robert Lee, F.R.S.

Surgeons—Mr. Caesar Hawkins, F.R.S., Mr. Cutler, Mr. Tatum, and Mr. H. C. Johnson.

Assistant-Surgeons—Mr. Prescott Hewett and Mr. George D. Pollock.

Dentist—Mr. Vasey.

Lecturers—Medicine—Dr. Pitman.
Surgery—Mr. Tatum.
Anatomy—Mr. Pollock and Mr. Gray.
Physiology—Mr. A. Johnson.
Chemistry—Dr. H. M. Noad.

The Hospital contains 350 beds.

Clinical Lectures are given by the Physicians and Surgeons of the Hospital during the Winter and Summer Sessions, and Clinical Instruction is given in the Wards by the Physicians and Surgeons, and on the Diseases peculiar to Women by the Obstetric Physician.

A Maternity Department, for the delivery of married lying-in women at their own homes, is established at the Hospital, under the superintendence of the Obstetric Physician.

The Surgeons' Perpetual Pupils are eligible to be Assistant House-Surgeon for Six Months, and House-Surgeon for Twelve Months (without additional Fee), when properly qualified for the office. Pupils of the Hospital are eligible to the office of Obstetric-Assistant, when duly qualified, at a salary of £100 per annum.

Pupils entering to St. George's Hospital Medical School are free to all Lectures and Hospital Practice necessary for the Examination of the College of Surgeons and Society of Apothecaries, by the payment of FORTY GUINEAS the first year, FORTY GUINEAS the second year, and TWELVE GUINEAS the third year. But Pupils have the option of entering to the different courses of Lectures and Hospital Practice by separate payments.

EXHIBITIONS AND PRIZES.

"The William Brown Exhibition," of Forty Pounds per Annum, tenable for Three Years, may be held by any Pupil, perpetual to the Medical or Surgical Practice, who has commenced his third, but not completed his fourth Winter Session. Pupils entering to the Hospital Medical School in the Session 1859-60 will be entitled to compete for this Exhibition.

A Prize of Twenty Guineas, for general proficiency in Medical Studies, will be offered to Students who enter to the Hospital Medical School for the Session 1859-60. The Examination will take place in July.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Royal College of Physicians of EDINBURGH.

At an EXTRAORDINARY MEETING of the ROYAL COLLEGE of PHYSICIANS of EDINBURGH, held on Friday, the 19th of August, the following Resolution was unanimously agreed to—

"That, in accordance with the opinion expressed by the General Council of Medical Education and Registration, on the 8th August, the Royal College of Physicians of Edinburgh do institute an Examination in Practical Medicine, to be undergone by Candidates, other than University Graduates claiming exemption under the Charter of the College; and that the College agree to alter Law 8 of the Regulations for the admission to the Licence, in accordance with the preceding Resolution."

The opinion of the General Medical Council, as expressed on the 8th August, is as follows:—

"That the General Medical Council is of opinion, that for the future no Licence or Degree should be given by any of the bodies in Schedule (A) to the Medical Act, without Examination."

The eighth Regulation, regarding the conferring of the Licences of the College, ran thus:—

"For one year after the passing of those Regulations (20th April, 1859), Licentiates of any of the existing Licensing Boards may be admitted Licentiates of the College without Examination, provided that they do not derive any profit from the sale of Drugs or Medicine, and that they produce certificates of character and professional qualification satisfactory to the College."

In conformity with the above Resolution, all Applicants under Regulation 8, for the Licence of the Royal College of Physicians of Edinburgh, with the exception of Graduates of British Universities, will in future be required to appear before the Examiners of the College, and to pass an Examination in the Practice of Medicine.

The Stamp-duty on the Diploma having been remitted, the Fee payable by Licentiates is now Ten Pounds.

In name and by authority,

Edinburgh, August 19, 1859. D. R. HALDANE, M.D., Hon. Sec.

Society for Relief of Widows and ORPHANS of MEDICAL MEN in London and its Vicinity.

Instituted 1788.

The Members are reminded that a QUARTERLY COURT of DIRECTORS will be held on the 7th day of SEPTEMBER next, at which Candidates for Admission into the Society can be proposed. It is desirable that the Form of Proposal be filled up and forwarded to the Secretary a few days before the Meeting. The Forms of Proposal may be obtained of the Secretary. The benefits of the Society are restricted to the Families of deceased Members of not less than two years' standing.

The Secretary attends at the Office every Wednesday and Friday, from Four to Five o'clock.

53, Berners-street, W. S. W. J. MERRIMAN, M.D., Secretary.

Sydenham College Medical School,

SUMMER-LANE, BIRMINGHAM, (opposite the General Hospital).—The SESSION 1859-60 will COMMENCE on TUESDAY, the 4th of October next, with an INTRODUCTORY ADDRESS by W. C. ORFORD, Esq., at Three o'clock in the afternoon.

Anatomy and Physiology—John White Keyworth, M.D.

Pathology—James Russell, M.D. L.R.C.P.L., Physician to the General Hospital.

Practical Anatomy and Demonstration—Messrs. George Elkington, Frowd Jones, and D. Johnson.

Principles and Practice of Medicine—Bell Fletcher, M.D. F.R.C.P.L., Physician to the General Hospital.

Principles and Practice of Surgery—Alfred Baker, F.R.C.S., Surgeon to the General Hospital.

Surgical Pathology—Oliver Pemberton, M.R.C.S., Surgeon to the General Hospital.

Chemistry—Alfred Hill, M.D. F.C.S., and F. Wrightson, Ph.D.

SUMMER SESSION.

Midwifery and the Diseases of Women and Children—Francis Elkington, M.D. Consulting Accoucheur to the Lying-in Hospital; and V. W. Blake, F.R.C.S., Medical Officer to the Lying-in Hospital.

Therapeutics—J. Russell, M.D. L.R.C.P.L.

Material Medica and Pharmacy—J. Bassett, M.R.C.S.E.

Practical Chemistry and Toxicology—Alfred Hill, M.D. F.C.S.

Botany—Frederick Westcott, Assoc. L.S.

Forensic Medicine—W. C. Orford, Medical Officer to the Lying-in Hospital; and G. Vernon Blunt, M.D.

This College was established for the purpose of affording a complete Medical Education. It is presided over by a Council composed of more than fifty of the most eminent Medical Practitioners of the midland counties. It is situated opposite to the General Hospital, and the hours of Lectures are so arranged as not to interfere with attendance upon Hospital Practice. Attendance upon the Lectures will qualify for examination at all the Royal Colleges, the Army, Navy, and India Boards. Clinical Courses will be given by those Lecturers who are attached to Public Institutions in the town. The Laboratory is fitted up with every convenience, so as to enable Students to obtain a practical knowledge of Chemistry. Care will be taken to instruct the Students in Practical Midwifery, and, under suitable regulations, they will be allowed to avail themselves of the Museum of the Lying-in Hospital. Prizes will be awarded in each Class, and one will be given by the Council for general proficiency.

Further particulars may be obtained on application to the Principal, Dr. Bell Fletcher, Waterloo-street; to the Treasurer, Dr. Russell, Newhall-street, who is authorised to receive Students; or to the Secretaries, Mr. F. Jones, 43, Newhall-street, and Mr. Bassett, 1, St. Paul's-square, Birmingham.

Sydenham College, Summer-lane, BIRMINGHAM.—MEDICAL TUTOR.

The Committee of Sydenham College are desirous of APPOINTING a MEDICAL TUTOR, to superintend the Education of the Students. Salary, £100 per annum.

Further particulars may be learned from the Principal, Dr. Bell Fletcher, 7, Waterloo-street, Birmingham, to whom applications must be addressed, not later than 1st September.

Manchester Royal School of Medicine

and SURGERY, Grosvenor-street, Piccadilly. SESSION 1859-60.

The WINTER TERM will commence on MONDAY, October 3rd, when the Introductory Address will be delivered by Dr. THOMAS H. WATTS, at Twelve o'clock.

WINTER LECTURES.

Physiology—Mr. Turner and Mr. Smith.

Descriptive Anatomy and Dissections—Mr. Lund and Mr. F. A. Heath.

Chemistry—Mr. Stone.

Principles and Practice of Medicine—Dr. Watts and Dr. Browne.

Principles and Practice of Surgery—Mr. Dumville and Mr. Southam.

SUMMER LECTURES.

Obstetric Medicine—Mr. Heath and Dr. Whitehead.

Pathology—Dr. Roberts.

Material Medica—Mr. Somers.

Forensic Medicine—Mr. Greaves and Mr. Morley Harrison.

Botany—Mr. Grindon.

Anatomy, Physiology, and Pathology of the Eye—Mr. Hunt and Mr. Lund.

Practical Chemistry—Mr. Stone.

Hospital Practice at the Royal Infirmary, where Clinical Lectures on Medicine and Surgery are regularly delivered by the Physicians and Surgeons of the Institution.

SCHOLARSHIPS.—In addition to Prizes for general proficiency and Certificates of Honour, three Scholarships for Perpetual Students will be offered for competition: one of £20, for third-year's Students; one of £15, for second-year's Students; one of £10, for first-year's Students.

Further particulars may be obtained from Mr. Southam, 21, Lever-street August, 1859.

Hospital for Diseases of the Skin,

25, NEW BRIDGE-STREET, BLACKFRIARS.—800 Patients attend here weekly. The Out-patients are seen every Monday, Wednesday, and Friday, at Four o'clock p.m.

Gentlemen desirous of attending the Practice can learn particulars by applying to the Dispenser, at the Hospital; or to the Surgical Officers, at their residences, GEORGE BURT, F.R.C.S., Hon. Sec. ALFRED S. RICHARDS, Secretary.

Evening Demonstrations of Anatomy.

—Mr. CHRISTOPHER HEATH, Demonstrator of Anatomy at the Westminster Hospital, will resume his Evening Course of DEMONSTRATIONS and EXAMINATIONS upon the DISSECTED SUBJECT on Wednesday, the 5th of October. The Demonstrations take place on Monday, Wednesday, and Friday evenings, during the Winter Session, from Seven to Nine o'clock, at the Westminster Hospital. Entrance Fee (perpetual) Five Guineas.

St. Mary's Hospital Medical School.—

The WINTER SESSION will commence on MONDAY, October 3rd, at Eight o'clock p.m., with an INTRODUCTORY ADDRESS by Mr. URE.

It is a distinctive characteristic of St. Mary's Hospital that the following Medical Appointments are annually conferred upon the Pupils free of very expense. The advantages of FIVE OF THESE APPOINTMENTS are exceed in money value as many SCHOLARSHIPS of Fifty Pounds each. There are four Resident Medical Officers who board (free of all expense) in the Hospital, three of whom are appointed for twelve months, and one (the Obstetric Officer) who is appointed for six months; four Non-Resident Medical Officers; a Medical and a Surgical Registrar; all of whom are appointed by the Weekly Board of Governors on the recommendation of the Medical Committee. Clinical Clerks and Dressers are selected from the best qualified Students. All the above offices are awarded after competition among the qualified Perpetual Pupils of the Hospital.

Physicians—Drs. Alderson, Chambers, Sibson, H. Jones, Sieveking, and Markham. Surgeons—Messrs. Coulson, Lanc. Ure, Spencer Smith, Walton, and J. Lane. Physician-Accoucheur—Dr. Tyler Smith. Ophthalmic Surgeon—Mr. White Cooper. Aural Surgeon—Mr. Toynbee. Surgeon-Dentist—Mr. Sercombe.

Further information may be obtained on application to the Dean of the School, who will also furnish the names of Gentlemen in practice in the vicinity of the Hospital willing to receive Pupils to reside with them.

SPENCER SMITH, Dean of the School.

St. Mary's Hospital, August, 1859.

Radeliffe Infirmary, Oxford.—Wanted

a DISPENSER to this Institution to enter on his duties on the 23rd of September next. Candidates must send to the Secretary on or before September 6th, satisfactory testimonials of their character and fitness. Assistance is allowed for Dispensing on Out-patient days; but no Laboratory-man is kept. The Salary is £40, with Board, Washing, and Lodging.

August 10, 1859. S. TRASH, Secretary.

Sudbrook Park, contiguous to

Richmond-hill, and with permitted communication between its own grounds and the Terrace Range of the Royal Park.—The Proprietor of this noble and highly popular HYDROPATHIC ESTABLISHMENT, for many years past the favourite resort of the Nobility and Gentry, and of foreign families of distinction temporarily residing in this country, is at the present moment desirous to meet with a Gentleman to enter upon the same just as it is, without the slightest disarrangement. Dr. ELLIS proposing to withdraw from the management of the Institution, after seventeen years' assiduous and successful attention to his professional engagements; or Dr. E. will receive, as a Partner, a Gentleman of suitable qualifications, who, sharing the labour and investment, will equally participate in all the advantages. Apply to Messrs. John Dawson and Son, Agents and Auctioneers, Marlborough Chambers, 49, Pall-mall.

Pepsine.—M. Boudault begs to state

that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr. PETER SQUIRE, her Majesty's Chemist, 277, Oxford-street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on "Pepsine," with Remarks by English Physicians. Edited by W. S. SQUIRE, Ph. D., published by J. Churchill, London, may be also had of the Author, 277, Oxford-street, price Sixpence.

H. Silverlock's Medical Label Ware-

HOUSE, Letter-Press, Copper-plate, and Lithographic Printing Offices, Wardrobe-terrace, Doctors'-commons, London, E.C.

H. SILVERLOCK'S stock of Labels for Dispensing purposes having been recently revised and enlarged, now consists of upwards of 800 different kinds. Yellow and Green Labels for Drug Bottles, Drawers, &c., at per book or dozen: a Book, containing a selection in general use in Surgeries or Dispensaries, 10s. 6d. Priced Catalogues of the above may be had, post free, on application. Printing of every Description at Moderate Prices.

Crosse and Blackwell, Purveyors in

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloaters Pastes, Strassbourg and other Potted Meats, and Calf's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of

CROSSE and BLACKWELL, 21, Soho-square.

Best Iron Wire, prepared expressly by

COCKER BROTHERS, NURSERY-STREET, SHEFFIELD, for SURGICAL PURPOSES, as supplied to Professor Simpson, Edinburgh; Dr. Churchill, Dublin; Mr. T. Spencer Wells, London; Dr. Bozeman, Montgomery, U.S.; and many others.—See Professor Simpson's Lecture in Medical Times, January 1st, 1859.

PURE SPIRITS FOR THE FACULTY.**S. V. R. 56 o.p., 17s. net Cash.—**

This quotation admits of neither credit nor discount, and 1s. per gallon must be added for packages, to be allowed on their return.

THE LANCET.
THE MEDICAL TIMES AND GAZETTE.
THE BRITISH MEDICAL JOURNAL.
THE MEDICAL CIRCULAR.
EDINBURGH MEDICAL JOURNAL.
THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate skin (whether arising from disease or otherwise), and is admirably adapted for nursery use. May be had of all respectable Chemists, Perfumers, &c.

SOAP-WORKS, CLERKENWELL, LONDON, E.C.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 23, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

First-class Provincial Practice for

DISPOSAL, with a Lengthened Introduction by Partnership. A year and a-half's purchase of the cash receipts in 1858 is the fixed price, half down, and the remainder on the retirement of the vendor. The command of between £2000 and £3000 is indispensable.

Apply to Messrs. LARA and WALTERS, 6, Pump-court, Temple, E.C.

One, Two, or Three Years' Introduction

by PARTNERSHIP, will be given to a Practice of over £700 per annum, nearly twenty years established, by the Vendor in a pleasant and rising suburb of London. For the first named term, £800 will be accepted.

Apply to Messrs. LARA and WALTERS, 6, Pump-court, Temple, E.C.

In a favourite Midland Town, a

PRACTICE of from £300 to £400 a-year, can be obtained for £400, half cash, and the rest at the end of a six months' Partnership Introduction. The connexion is an old-established and compact one.

Apply to Messrs. LARA and WALTERS, 6, Pump-court, Temple, E.C.

Medical.—Wanted, an Out-door

ASSISTANT, to Dispense, Visit, and attend Midwifery. Qualifications not requisite, but preferred. Salary for first year, £90. Address, B. J. Messrs. Corbyn and Co. 300, High Holborn.

As Out-door Dispensing Assistant, or

ACCOUNTANT. The Advertiser is open to an Engagement. Neighbourhood of STOKES-NEWINGTON, HIGHBURY, or ISLINGTON preferred. First-class References. Well up in Chemical and Microscopic Examination of Urine. Can Cup. Address, L.A.C., 3, Caroline-place, Milton-road, Stoke Newington, N.

Assistantship.—An M.D. and Surgeon

(Registered) of Edinburgh, 1851, who has had experience in Hospitals, and for some years in the Indian Army, is willing to become Assistant for a time to a Medical Man in good practice. Particulars can be stated in correspondence. Address to M.D., care of Messrs. Cay and Black, 65, George-street, Edinburgh.

A Private Asylum for the Insane of

the HIGHER CLASSES, situated twelve miles from London, is to be DISPOSED OF. For particulars, address to X. X., Hatchett's Hotel, Dover-street, Piccadilly.

To Parents and Guardians.—A Married

Medical Man, residing close to Guy's and St. Thomas's Hospitals, will have VACANCIES, in October next, for ONE or TWO HOSPITAL PUPILS to reside with him. Every advantage afforded for study, and every domestic comfort guaranteed. Terms moderate. Apply by letter, or personally, to M.D., 12, Wellington-street, London-bridge, S.E.

To Medical Men.—A comfortable

HOME is required for a YOUNG GENTLEMAN in his nineteenth year, who has recently entered as a Student at the University College Hospital. The neighbourhood of Russell-square preferred. Address, with full particulars and terms, to F. W. G. 25a, Bucklersbury, City.

Medical Pupils.—A Physician to one

of the Metropolitan Hospitals, residing at the West End of London, at a convenient distance from most of the Medical Schools, is prepared to receive into his family TWO MEDICAL PUPILS, and to superintend their Studies. The highest references will be given and required. Address to S. N., care of John Ferring, 251, Regent-street.

Medical.—Wanted, a Practice, or a

PARTNERSHIP in a PRACTICE, where the Advertiser's share would not be less than £400 to £500 per annum, with a prospect of increase; if a Partnership, one with Succession in a few years would be required. The Advertiser prefers a Town Practice, with a chance of an Hospital Appointment; but he has no objection to a Country Practice in a good district, where the Railways are easily accessible. Address, Medicus, care of H. Brandon, Esq., Solicitor, 15, Essex-street, Strand, London.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Obstetrical Society of London.—The

next ORDINARY MEETING will be held on WEDNESDAY, Oct. 5, at 8 p.m.; the President, Dr. RIGBY, in the Chair.

The First Session of the Society will terminate in December, up to which time no Entrance Fee will be demanded. The Council beg to intimate their intention of recommending the Society to require the payment of an Entrance Fee of One Guinea, in addition to the Annual Subscription, by Fellows elected subsequently to this date.

Gentlemen desirous of becoming Fellows are requested to apply to one of the Honorary Secretaries.

By order of the Council,
53, Berners-street.

GRAILY HEWITT,
THOS. H. TANNER, } Hon. Secs.

The Queen's Hospital, Birmingham.—

A VACANCY has occurred in the Office of RESIDENT MEDICAL OFFICER. He is provided with board, lodging, and washing, and receives a salary of £75 per annum, with an annual increase of £5 the first year, and £10 the second and third year, to £100.

The Candidates, who must be Members of the Royal College of Surgeons, and Licentiates of the Apothecaries' Company, are requested to send in their testimonials of qualification to the Secretary on or before the 1st of November next. The Candidates whose qualifications are not approved will be informed thereof immediately after the 7th of November, whilst those from whom the Committee of Council wish to make the selection will be invited to attend a meeting for that purpose, at their own expense of which information will be sent to them.

The Surgeon elected will be required to enter on the office on the 1st of December next, and to engage for three years.

DAVID MALINS, Jun., Secretary.

Metropolitan Free Hospital,

9, DEVONSHIRE-SQUARE, BISHOPSGATE, N.E.—A VACANCY having occurred by the Resignation of Dr. Ramskill, the Senior Physician, consequent upon his appointment to the London Hospital, Notice is hereby given, that Application for the Appointment, with Testimonials &c., may be addressed to the Committee, at the Hospital, on or before the 6th day of SEPTEMBER, 1859. Candidates must be either Fellows or Licentiates of the Royal College of Physicians of London, or pledged to become such, if elected, within twelve months of the date of such election.

GEO. CROXTON, Secretary.

Devon County Lunatic Asylum.—

WANTED, for this Institution, a MEDICAL ASSISTANT. Salary £100, with board and residence. Candidates must be unmarried, and legally qualified to practise Surgery and Pharmacy.

Applications and Testimonials to be sent to me on or before the 5th day of September next.

T. E. DRAKE, Clerk to the Visitors.

Exeter, August 17, 1859.

Salop Infirmary, Shrewsbury.—

DISPENSER and DRESSER WANTED. The situation of Dispenser and Dresser at this Infirmary being about to become vacant shortly. Candidates for the Office are desired to send in their Testimonials as to character and qualifications on or before Thursday, the 15th of September next. The salary is £50 per annum, with board, washing and residence in the Infirmary.

By order of the Board of Directors,
Board Room, August 20th, 1859.

HENRY BEVAN, Secretary.

Duffield, Derbyshire.—Four miles from

DERBY.—TO BE SOLD (with possession on the 29th September) A very desirable COPYHOLD MESSUAGE or TENEMENT situated in the main Street of the beautiful and important village of Duffield on the high road from Derby to Matlock. The premises contain ample accommodation for a gentleman's family, with Garden, Vinery, Forcing Houses, and fruit trees in full bearing, Stables, Coach House, &c. The premises have for many years been occupied by a Medical Man and contain surgery with private entrance, and would undoubtedly offer a very favourable opening to any Medical gentleman wishing for a highly respectable Country practice. There is a station within three minutes' walk from the house, and railway communications to all parts of the Kingdom. For particulars apply to Messrs. J. and F. Barber & Currey, Solicitors, or Messrs. Moody and Newbold, House Agents, &c. Derby.

London: Printed by CHARLES REED and BENJAMIN PARDON of 1, 2, and 3, Lovell's-court, Paternoster-row, in the City of London, and published by JOHN CHURCHILL, at the Publishing Office, No. 11, New Burlington-street, in the Parish of St. James, in the City of Westminster.—August 27, 1859.

Sketch of the Medical Topography, or
CLIMATE and SOILS, of BENGAL and the NORTH-WEST
PROVINCES. By JOHN MCLELLAND, F.L.S., F.G.S., Surgeon,
General Service.

John Churchill, New Burlington-street.

Just published, fcap. 8vo, cloth, 5s.
An Introduction to Clinical Surgery;
with a Method of Investigating and Reporting Surgical Cases. By
FURNEAUX JORDAN, Assistant-Surgeon to Queen's Hospital, Professor
of Anatomy at Queen's College, Birmingham.

"Mr. Jordan's work is one likely to prove of great practical utility, and we cordially recommend it to the notice of our Profession."—*Medical Times and Gazette.*
"The publication of this work is very opportune for students now about to commence in our schools the study of Surgery. To them we earnestly recommend it as supplying, in a compact form, all that they require which any book can give for the purpose of becoming competent to analyse, duly value, and correctly register the phenomena of surgical affections, to the literature of which it is a highly interesting addition."—*Dublin Quar. Jour. of Med. Science.*
"The symptoms and phenomena of surgical diseases and injuries carefully arranged."—*Brit. and For. Med.-Chir. Rev.*
"It is written with great care and clearness, and will, without doubt, do its share—not a trifling one—of work in fitting the surgical student for the efficient practice of his art."—*Brit. Med. Jour.*

John Churchill, New Burlington-street.

NEW EDITION OF SKEY'S OPERATIVE SURGERY.

In crown 8vo, with many Woodcuts, price 12s. 6d. cloth,

The Principles and Practice of
OPERATIVE SURGERY. By FREDERIC C. SKEY, F.R.S.,
Member of the Council of the Court of Examiners of the Royal College
of Surgeons of England, Surgeon to St. Bartholomew's Hospital, &c. &c.
Second Edition, revised and enlarged.

"We accept it as the candid record of the experience of one of the foremost amongst us—as the work of a man who has thought deeply and independently, and has honestly endeavoured to make the knife—what, indeed, it ever should be—the last resource of the Surgeon."—*The Lancet.*
"The independence of thought and research which characterises it gives it a peculiar merit, and justifies our recommending it to every earnest student of his profession."—*British and Foreign Medical Review.*
"There is much sound and wholesome doctrine in Mr. Skey's work—his reputation as a good Surgeon cannot fail to be advanced by it."—*Medical Times and Gazette.*

"We are glad to see this Second Edition, and can honestly recommend it as an invaluable guide to operative practice."—*Medical Circular.*

Scammony Manufactured from the
ROOT.—This Pure Resin may be had of all Wholesale Druggists at 25 per cent. under the price of the best Virgin Scammony.

And the superiority of its quality was fully explained at a meeting of the Pharmaceutical Society, and reported at length in their Journal of March last, from which the following are extracts:—
"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frands which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with.

"A. B. GARROD, M.D., F.R.S., F.R.C.P.
Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens.

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs. M'Andrew's scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power.

"GEORGE JOHNSON, M.D., F.R.C.P.
Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

AUDITORS—Rt. Gardner, Esq.; Rt. Hichens, Esq.; H. W. Ripley, Esq.
BANKERS—The Bank of England, and Messrs. Currie and Co.
SOLICITORS—Messrs. Cotterill and Sons, and Messrs. Parke and Pollock.
PHYSICIAN—Geo. Burrows, M.D., F.R.S., 18, Cavendish-square.
SECRETARY—Michael Elijah Impey, Esq.

After the operations of a Quarter of a Century, the Directors invite, with great confidence, the attention of the Public to the marked success which has attended this Society, and to the strong claims it possesses to the confidence and support of all classes desirous of effecting Assurances on Lives. Combining the advantages of a Mutual and a Proprietary Company, and without attempting a rash competition with other Offices, it has pursued a steady, progressive course, affording all the benefits which, consistently with security to Assurers and Assured, can possibly be given.

The amount of the Society's Funds actually Invested exceeds £730,000. Upwards of £997,380 have been already paid in Claims and Bonuses, and the existing Policies amount to £2,214,998.

The Tables of Rates for Residents in Europe have been prepared upon the most approved principles to ensure moderation and security.

Assurances can be effected with or without a Participation of Profits; on ascending or descending scales; and for a limited number of payments. The Society advance money on Mortgage; purchase Reversions and Life Interests; and grant Loans on such Securities and on Policies.

An Annual Division of One-fifth of the Profits is made, 75 per cent. of which is appropriated to Policy-holders, and 25 per cent. to the Shareholders; the remaining four-fifths are set apart towards the average of succeeding years. The Assurers can apply their Profits to the immediate Reduction of their Premiums, or as a Bonus to the sum assured.

All Medical Fees and Stamps are paid by the Society.

INDIAN BRANCH.

The Universal was the first Assurance Society that secured to Residents in India fixed rates and the advantages enjoyed by those in Great Britain. Separate Tables for the Civil and Military Services were originally framed with the utmost care from the Records of the India House, and valuable statistical returns accessible to this Society alone. To test their adaptation to the present time, and to ascertain whether any reduction could be safely made, they have recently undergone a minute and laborious investigation by two eminent London Actuaries, whose Report has established their soundness and accuracy.

Notwithstanding the extraordinary mortality occasioned by the late Mutiny, the Directors were enabled at the last Annual Division of Profits to announce a Reduction of Premiums on all Policies dated prior to 11th May, 1854, of £36 per cent.—a result attributable, in a great measure, to the correctness of the Rates and the judicious management of the Local Committees in India.

The attention of persons proceeding to India, and of residents there, is requested to a peculiar and most important advantage offered by this Society,—that on the return of Assurers to Europe the premiums on their Policies will be reduced to the English scale corresponding with the age when the Assurance was effected, without reference to the state of their health on their return.

Tables of Rates and all further information will be afforded at the Office in London, or by the Agents in India:—

Messrs. BRADDON and Co., Calcutta.
Messrs. LAINBRIDGE, BYARD, GAIR, and Co., Madras.
Messrs. LECKIE and Co., Bombay.

MICHAEL ELIJAH IMPEY, Secretary.
King William-street, E.C., June, 1, 1859.

"PULVIS JACOBI VER, NEWBERRY'S."

Diphtheria, Fevers, Hooping Cough,
&c.—We beg to caution the Profession against imitations of this invaluable Medicine, for so many years prescribed as "Pulvis Jacobi Ver." but to which it is now necessary to add the name "NEWBERRY'S," to secure prescribers against the substitution of articles advertised as James' Powder, BUT WHICH HAVE NOTHING IN CHARACTER, DOSE, OR EFFECT, with the original article, which has been sold by the Newberry Family continuously since its introduction in 1746.

Price, for dispensing: 1 oz. bottles, 9s.; ½ oz. do. 3s. 4d.

45, St. Paul's-churchyard, London. (Signed) F. NEWBERRY & SON.

Mr. Howard, Surgeon-Dentist, 52,
FLEET-STREET, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without Springs, Wires, or Ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR or DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed Teeth stopped and rendered sound and useful in mastication.
52, Fleet-street. At home from Ten till Five.

Wines from the Cape of Good Hope.

W. and A. GILBEY'S SOUTH AFRICAN PORT, SHERRY, &c. &c. 20s. per Dozen. First growths only. Two samples for 12 stamps. Those who cannot swallow Cod-Liver

Oil in its crude state should try NEWBERRY'S COD-LIVER OIL CAKES.—"The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered."—Medical Times, Feb. 12th, 1859. Packets, 1s. 9d. and 3s. F. NEWBERRY and SONS (Proprietors of the "PULVIS JACOBI VER. NEWBERRY'S") 45, St. Paul's Churchyard, London. ESTABLISHED A. D. 1746.

For Infants.—The British Feeding

BOTTLE (registered) may be placed in any position without the Food running out. The supply can be regulated by a stop-cock; being electrplated, it may be instantaneously cleaned. Unlike wood, ivory, or bone, it is impervious to moisture, cannot crack or become sour; there is no possibility of the infant drawing air with the food.

By W. T. COOPER, Pharmaceutical Chemist, 26, Oxford-street, London. Price 7s. 6d., or free to any Railway Station, 8s. 6d.

WINES FROM SOUTH AFRICA.

Denman, Introducer of the South

AFRICAN PORT, SHERRY, &c. 20s. PER DOZEN, BOTTLES INCLUDED. A PINT SAMPLE OF EACH FOR 24 STAMPS.

Wine in cask forwarded free to any Railway-station in England.

EXCELSIOR BRANDY, Pale or Brown, 15s. per gallon, or 30s. per dozen. Terms Cash. Country orders must contain a remittance. Cross cheques "Bank of London." Price Lists, with Dr. Hassall's analysis, forwarded on application.

JAMES L. DENMAN, 65, Fenchurch-st., corner of Railway-place, London.

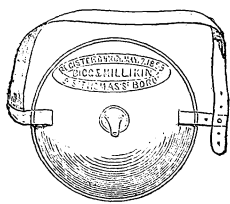

Or SACCHARATED CAPSULES.—Copaiba and Cubebs are, doubtless, the best remedies, but these drugs are of a repulsive taste and odour, and occasion colicky pains, nausea, and gastric disturbance. M. Jozeau has succeeded in rendering these valuable therapeutic agents perfectly innocuous, by increasing, in his Copaine, all the curative properties. This preparation has been adopted by the Paris Academy of Medicine, after more than a thousand trials in Paris, and the different London Hospitals, viz., St. Thomas's, Guy's, and St. Bartholomew's, under the care of Messrs. Lloyd, Poland, and Le Gros Clark. "Lancet," Nov. 6, and Dec. 10, 1852. The Copaine, which is in form of a pretty pink sugar-plum, effects a cure in about six days, either in recent or chronic diseases. 100 Capsules, 4s. 6d., at G. JOZEAU'S, French Chemist, 49, Haymarket, London; 22, Rue St. Quentin, Paris; and all the most important Chemists.

Great Saving in the Purchase of New

MEDICAL GLASS BOTTLES AND PHIALS at the NORTH LONDON GLASS BOTTLE WORKS, ISAACS and SON (Proprietors).—London Warehouses, 24 and 25, Francis-st., Tottenham-court-road, W.C.

begs to call attention to the various improvements in Patent ELASTIC STOCKINGS, BELTS, KNEE-CAPS, SOCKS, and Ladies' and Gentlemen's SPINE SUPPORTERS. A new description of BELT, invaluable for prevention of Cholera and the cure of Rheumatism, Lumbago, &c.

N.B.—Every description of INDIA-RUBBER BANDAGE, vulcanised on the newest principle.

Directions for measurement sent by post.

N.B. A Liberal Discount to the Profession.

A Female to attend on Ladies.

Superphosphate of Iron and Super-

PHOSPHATE OF IRON AND LIME. New Remedial Agents introduced to the notice of the Profession at the Meetings of the Medical Society of London, and now extensively employed by the most eminent members of the Medical Profession. The Syrup is the most eligible mode of administering these valuable Remedial Agents. Mr. GREENISH will be happy to forward a variety of cases which have been furnished to him, where its success has been most marked, and which will serve to indicate where it may be most advantageously employed.—20, New-street, Dorset-square.

TRADE MARK.

Brown & Polson's Patent Corn Flour,

preferred to the best Arrowroot. DELICIOUS IN PUDDINGS, CUSTARDS, BLANCHMANGE, CAKE, &c., and especially suited to the delicacy of CHILDREN and INVALIDS.

The Lancet states—"This is superior to anything of the kind known."

Trade Mark and Recipes, on each Packet, 4, 8, and 16 oz.

Obtain it from Family Grocers, Chemists, &c.

77a, Market-street, Manchester; and 23, Ironmonger-lane, London.

Struve's Seltzer, Marienbad, Vichy,

KISSINGEN, and other MINERAL WATERS.—Under her Majesty's especial Patronage.—ROYAL GERMAN SPA, BRIGHTON, STRUVE'S PUMP-ROOM and PROMENADES, offering every facility for a Course of Mineral Waters, as perfect and beneficial as at the natural springs, are NOW OPEN, for the Thirty-fifth Season. A prospectus, with the highest Medical testimonials, may be obtained gratis, at the Pump-room, or from George Waugh and Co. Chemists to the Queen, 177, Regent-street (west side), London, and other respectable houses in London and the provincial towns, where orders for Struve's Bottled Mineral Waters continue to be executed.

CATION.—The success obtained by Struve's Mineral Waters, owing to their perfect identity with those of the natural springs, has induced several parties to attempt imitations, sold as "Brighton Seltzer," "Brighton Vichy," &c., an analysis of some of which has shown an utter disregard of their true chemical composition. To distinguish Struve's Waters from all others, every bottle has a label and red ink stamp over the cork, each bearing Struve's name, without which name none is genuine, though contained in Struve's old bottles.

Health, Fresh Air, and Pure Water.

—By Her Majesty's Letters Patent.—CONDY'S FLUID contains NASCENT OXYGEN, nature's true and only purifying agent; instantly removes all offensive smells; renders impure water fresh, and the air pure; when diluted for use, is of a beautiful colour, not soiling the finest linen; is harmless, and particularly adapted for toilet use, being both refreshing and exhilarating. The Medical Profession have expressed their unqualified approbation of its merits. One gallon makes 200 gallons adapted for use. The cooling, healing, gently stimulating and invigorating properties of this Fluid render it, when diluted, a lotion possessing peculiar and valuable characteristics, whether for bathing the bodies of invalids, incorporating in poultices, or washing and healing wounds. Patronised by the Board of Health, and most public departments, hospitals, schools, and adopted by the India Council in preference to all other disinfectants. In bottles, 6d. 1s. and 2s.; stronger and purer, 1s. 2s. and 4s.

CONDY'S PATENT HEALTH POWDER also contains NASCENT OXYGEN, is odourless, and destroys all smells; in bottles, 1s. 6d. and 3s., and in casks of 1 cwt. 30s.—Wholesale agents, John Bell and Co. chemists, No. 338, Oxford-st. W.; Butler and Crisp, 5, Cheapside, St. Paul's; Ferris and Co., Bristol.—Chemical Works, Battersea, S.W.

NEPENTHE, OR ANODYNE TINCTURE

(OBTAINED EXCLUSIVELY FROM OPIUM),

PREPARED AT THE LABORATORY OF FERRIS, TOWNSEND, LAMOTTE, & BOORNE,
MANUFACTURING CHEMISTS AND WHOLESALE DRUGGISTS, BRISTOL.

This preparation has now been for many years extensively used by a large number of eminent members of the Medical Profession with the greatest success. It does not produce headache, stupor, giddiness, prostration of strength, constipation, or the usual unpleasant symptoms attending the use of other preparations of opium.

Nepenthe has frequently been found of essential service in cases of Cancer, where every other opiate has failed.

The following Testimonials received from Medical gentlemen in extensive practice will be regarded as satisfactory proof of its efficacy :—

MEDICAL TESTIMONIALS.

"Having prescribed your 'Anodyne Tincture' in many cases, I would strongly recommend its more general adoption. It is especially useful in the wakefulness common after parturition, or other unusual exertion or excitement. It produces a refreshing sleep, and I do not remember any case in which it has caused the objectionable effects of the other opiate preparations.

"8, Wellington-street, London-bridge, August 14, 1856.

"SAML. GRIFFITH, M.D. London, M.R.C.P.
Consulting Physician-Accoucheur to the Farringdon Dispensary,
Physician-Accoucheur to St. Thomas's Hospital, &c."

"Gentlemen,—I have great satisfaction in bearing testimony to the value of your 'Nepenthe,' in relieving suffering from disease, and in procuring sleep where ordinary narcotics fail or disagree. For several months I have found it very effectual in relieving a great sufferer when all the ordinary anodynes had ceased to benefit, and although the dose has not been increased for months, the relief is as complete.

"Nepenthe' is a very valuable addition to our means of relief, and the Profession and the public are greatly your debtors for it.

"I am, Gentlemen, yours obediently,

"EDWD. BECK, M.D. Cantab.
Physician to the East Suffolk and Ipswich Hospital."

"To Messrs. Ferris & Co.

"Gentlemen,—'Nepenthe' has, for some time, been a favourite narcotic with me, and I infinitely prefer it to any preparation of opium now extant. It has proved a remedy of great value in all cases of Neuralgia, Chronic Rheumatism, Hypochondriacism, and indeed all affections where the use of a sedative is indicated; and in Delirium Tremens it is certainly invaluable, performing its operation upon the system, without leaving those distressing feelings consequent upon the use of opiates in general.

"I remain, Gentlemen, your obedient Servant,

"WILL. WOOD BRADSHAW, M.D. M.R.C.P. & F.R.C.S. Lond. &c. &c. &c."

Extract of a Letter from the late G. W. CAINES, Esq. M.R.C.S.

"Please to send me some 'Nepenthe,' as I have a patient with cancer in the breast, with whom no other preparation of opium agrees. I have tried them all."

"Uffculme (Devon), Feb. 16, 1854.

NEPENTHE may be procured direct from Messrs. FERRIS and CO., 4 and 5, Union-street, Bristol; from respectable Dispensing Chemists throughout the Kingdom; and from the following Agents :—

LONDON :—Mr. Thos. Keating, 79, St. Paul's-churchyard; Messrs. Evans, Lescher, and Evans, 60, Bartholomew-close; Messrs. Savory and Moore, 143, New Bond-street; Messrs. J. Bell and Co., 333, Oxford-st.

MANCHESTER :—Mr. James Woolley.

LIVERPOOL :—Messrs. Clay and Abraham; Messrs. Evans, Son, and Co.; Messrs. Clay, Dod, and Case.

BIRMINGHAM :—Messrs. Southall Bros. and Co.

YORK :—Messrs. Butterfield, Clarke and Co.

NORWICH :—Messrs. Smith and Sons.

PLYMOUTH :—Messrs. Balkwill and Co.

EXETER :—Mr. Geo. Cooper; Messrs. A. Evans and Co.

EDINBURGH :—Messrs. Raines and Co.

As many imitations of Nepenthe have been attempted, the signature of FERRIS and COMPANY is placed over the cork of every bottle of the true preparation; and none purchased without this protection can be depended upon.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

CAUTION.

Serious and repeated complaints having been made of a discreditable system pursued by many Chemists and Druggists of intrusively recommending or surreptitiously substituting a pale, yellow, or coarse brown preparation, when Dr. de Jongh's Oil is prescribed, the Medical Profession are respectfully and earnestly solicited to afford their assistance in counteracting and repressing a practice alike injurious to their patients and to the fair repute of a remedy now held in such high and general estimation. In all cases where this Oil cannot be procured from a respectable Chemist, application should be made to Dr. de Jongh's Agents,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

By whom any quantity will be immediately forwarded.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. Mr. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

ORIGINAL LECTURES.

CLINICAL LECTURES

ON

THE DISEASES OF WOMEN.

By J. Y. SIMPSON, M.D. F.R.S.E.

Professor of Medicine and Midwifery in the University of Edinburgh.

LECTURE XXI.

ON SPURIOUS PREGNANCY, OR PSEUDOCYESIS.

GENTLEMEN,—The author of the two remarkable dissertations on “Diseases of Women,” usually published among the Hippocratic treatises, when at one place treating of displacement and stricture of the os uteri, takes occasion to remark that sometimes under such circumstances “the menstrual fluid is determined to the mammae, and produces their enlargement; the abdomen swells, and inexperienced patients believe themselves to be pregnant; in truth,” he continues, “they present all the phenomena usually seen in women at the seventh or eighth month of utero-gestation; the belly attains a proportional degree of enlargement; the breasts swell up, and milk seems to be secreted. But when this period has passed, and the full term of pregnancy should be complete, the mammae shrink up and diminish in size, the abdomen likewise collapses; all trace of the milk disappears, and the abdomen sinks in, and all tumefaction is dispelled.”

The diseased state described in the preceding quotation is that state usually spoken of as the state of “spurious pregnancy.” In his “Nosology,” Dr. Mason Good proposed to describe this peculiar affection under the corresponding Greek name of “Pseudocyesis” from *ψεύδος*, a lie, and *κύσις*, pregnancy. We have lately had two examples of this disease among patients visiting the female ward. One of the patients, who remained in the ward for a short time, suffered from suppression of the menses, continuing for a period of three or four months, and alternating with a state of menorrhagia; she had occasional sickness; the mammae were slightly enlarged, and the abdomen somewhat protuberant. She suffered, in short—but not in a well-marked degree—from this morbid condition of spurious pregnancy. In the other patient, who was under the Medical charge of one of the students of the class, not only were all the usual phenomena of pregnancy well marked for the usual time; but, what is far less frequent, there latterly supervened all the common phenomena of labour; but of labour without any result, as the uterus was quite empty.

There are two varieties of pseudocyesis, or spurious pregnancy, a *local* and a *constitutional*. The former I have already described to you as seen in those cases of dysmenorrhœa where the patient has occasionally, or even at every monthly period, excessive development of the mucous membrane, which becomes vascular and swollen, and is in part shed off in the form of a separate membrane, resembling in every respect the decidua which is formed in the early weeks of every real pregnancy. In such cases the patients usually suffer a great deal of pain during the expulsion of these uterine casts, and they are sometimes affected with some of the ordinary constitutional and sympathetic phenomena of pregnancy. Thus they frequently are troubled with sickness and vomiting; the mammae sometimes become enlarged, and the areolæ darkened for one or two weeks both before and after these dysmenorrhœal membranes are thrown off. The most striking features of the disease in such cases, however, and the most distressing symptoms depend upon the local changes in the uterus; and as I have already discussed these, both as regards their pathology and treatment in my lecture on Membranous Dysmenorrhœa, I need say no more about that subject now, but pass on at once to the consideration of that more frequent form of spurious pregnancy, of which the more striking phenomena are all of constitutional origin, and the disease true, or

CONSTITUTIONAL PSEUDOCYESIS.

In this constitutional or sympathetic variety of spurious pregnancy, then, there may be no appreciable local change

whatever; but the patient suffers from nausea and vomiting, and the other sympathetic phenomena common to pregnant females. The mammae become enlarged, the areolæ are darkened, and the gland gives forth its milky secretion. The abdomen enlarges gradually until it occasionally comes to assume the form, and size too, of an abdomen which contains a gravid uterus, and the patient feels movements in its cavity, which she unhesitatingly pronounces to be movements of a fœtus. Menstruation is usually pretty methodic, but you will occasionally find it altogether suppressed for a time, or only coming on very irregularly, and with a scanty flow. All these symptoms may arise and go on slowly and progressively for a period of nine months, or longer, and the patient may labour under the delusion that she is in the family-way, until, it may be, symptoms set in resembling the ordinary efforts of labour, and then, when a Medical man is sent for to attend at the delivery, it may happen that she first discovers she has never been pregnant at all.

FREQUENCY OF THE DISEASE.

Before I proceed to point out to you more particularly the nature of this disease, and to tell you how it is to be recognised and treated, let me first of all remark that it is a disease which, when you come to practise, you will find to be of far more frequent occurrence than the comparative silence of our obstetric text-books on this malady would lead you to infer. It is not by any means confined to the married, or to those who have borne children, but is seen among the unmarried and childless as well. Among the former, however, it is more frequent; and there are perhaps few women in married life who have not presented more or less marked symptoms of it once or oftener. The disease, as we have seen, was known of old, and is duly noticed in the Hippocratic writings. But in modern times, Medical writers have passed it by in almost complete silence; and the only notice of any importance in regard to it that I know of in the English language, is to be found in the admirable and classical work of my friend Dr. Montgomery on the “Signs and Symptoms of Pregnancy,”—a work which I beg strongly to recommend to your careful perusal, as a volume not less remarkable for its great accumulation of original and collated facts, than for its logical statements and reasoning, and its elegant and classic style. Yet, as I say, cases of spurious pregnancy are constantly occurring in practice, and patients often go about from one Practitioner to another seeking relief, or desiring to obtain some certainty as to the nature of their affection, a point in regard to which they are often in the greatest doubt. They fancy themselves, for the most part, to be pregnant; but sometimes they suppose themselves to be subject to very different kinds of disease, as in the case of a patient from the West Indies, whom I have under my care just now, and who, it was there imagined, had some hydatids in the uterus.

To show you how difficult it is to distinguish cases of simple spurious pregnancy from other forms of disease, let me merely tell you one fact. Six different cases have been put upon record, where patients have been supposed to be labouring under ovarian disease; and in these six cases, when the abdomen was laid open with the view of removing the ovarian tumour, there was found to be no tumour there—nothing unusual or abnormal, except, perhaps, a slight degree of distension of the bowels. Such needless tampering with the lives of patients may suffice to impress upon you the dangers of making a false diagnosis, and teach you not to neglect any means by which you are likely to obtain a clearer insight into the nature of this often obscure and puzzling form of disease.

TIMES OF ITS OCCURRENCE.

As to the period of life when it is most likely to be met with, Dr. Montgomery thinks that it occurs most frequently at the climacteric period, when the catamenial discharges cease to appear, and when the female constitution seems to become more liable to be affected by morbid influences. But I feel pretty certain that the disease occurs at least as often during the first year after marriage as at any later period. At least, you will find, on making inquiries of patients, that they have very often been deceived into the belief that they have become pregnant at the time I refer to, from the temporary suppression of the menses, attended with sickness and some degree of swelling of the abdomen; but probably from the circumstance that the delusion is not usually kept up for such a length of time in these patients, they do not so often come

under the observation of the Practitioner, and are thus very commonly altogether overlooked. Spurious pregnancy, however, may occur at any period during the catamenial life, and it is often enough developed during the intervals between two successive real pregnancies; and a succession of attacks is sometimes seen in the same individual.

MAY THE DISEASE OCCUR IN THE UNMARRIED?

Certainly, and then it constitutes a very delicate class of cases. When occurring in the unmarried, it is usually set down as hysteria: but sometimes all the characteristic phenomena are most distinctly indicated, and it is then a very difficult and delicate matter to answer the patient's inquiries regarding her disease. No one would choose to speak to the patient or her friends of "spurious pregnancy," under such circumstances, as the mere name itself would be sufficiently offensive. Perhaps the descriptive designation proposed by Dr. Good of pseudocyesis would save sometimes the Practitioner from difficulty—when hard pressed, as we sometimes are—to give our patient's affection a proper name. That the affection may occur in the most moral persons, however, and in virgins, is certain; and if any confirmation were needed, it would be found in the fact that it has sometimes been seen among a class of females as to whose morality and state no question can be raised, namely the females of our domestic animals. Harvey pointed out long ago in his celebrated work on "Animal Generation," that "over-fed bitches which admit the dog without fecundation following, are nevertheless observed to be sluggish about the time they should have whelped, and to bark as they do when their time is at hand; also to filch away the whelps from another bitch, to tend and lick them, and also to fight fiercely for them. Others," he goes on to say, "have milk or colostrum as it is called, in their teats, and are, moreover subject to the diseases of those which have actually whelped; the same thing is seen in hens which cluck at certain times, although they have no eggs on which to sit. Some birds also, as pigeons, if they have admitted the male, although they lay no eggs at all, or only barren ones, are found equally sedulous in building their nests." I had a patient in the neighbourhood of Edinburgh, who used to keep a seraglio of female dogs, and was interested in observing their habits and physical characteristics. This person was a careful observer, and told me that every year, and occasionally twice every year, some of these "over-fed bitches" had all the symptoms of pregnancy, although they had been kept secluded from all male society. And the phenomenon so often spoken of, of animals without any offspring of their own, adopting and nursing the young of other animals, belonging sometimes to an entirely different class, is, doubtless, only one of the forms in which this peculiar affection may be manifested.

Mistakes from it among the Married.—But though the disease may thus manifest itself among unmarried females, it is chiefly among the married that the more marked instances of it are met with; and awkward enough are the mistakes into which those sometimes fall, who are affected by it. I have repeatedly known ladies make all the usual preparations for confinement, secure the services of a nurse and Medical attendant, lay in a stock of baby-clothes, and, in short, have everything in readiness for the birth of a child, when they were in reality not pregnant at all. They may sometimes even be put to very great inconvenience in consequence, breaking up their large establishments in the country, and coming into town at most unseasonable periods, in order to be under the immediate care of their usual accoucheur. I have thrice had ladies come into Edinburgh to be confined under my care, leaving establishments, who, when they came to town, proved not pregnant. A striking instance of this kind occurred in the practice of my predecessor, Dr. Hamilton, who was engaged, not very long before his death, to attend a lady in her approaching confinement. As the expected period drew near, a heavy fall of snow came on and blocked up the roads, and the lady, terrified at the idea of being detained in her country house, had a number of labourers set on to cut a driving-path through the snow; but it was unnecessary work and trouble, as the case was only one of spurious pregnancy. Such mistakes oftenest occur in patients pregnant for the first time, and who are inexperienced as to the phenomena and sensations of pregnancy. But the affection is by no means limited to them. You will frequently

enough in practice find women who have previously borne children making such mistakes about themselves, and imagining that they feel every movement of the child just as they have done in real pregnancies. In some cases, but they are much more rare, you may have the phenomena of spurious parturition as well as spurious pregnancy. That is, when the ordinary term of nine months has been completed there may supervene the phenomena of a common labour. The ordinary preliminary symptoms are first seen, the pains set in at first irregular, slight, and resembling the pains characteristic of the first stage of labour, and gradually change into the regular, strong, expulsive pains, characteristic of the second stage. The more complex phenomena of instrumental labours are even occasionally simulated. Dr. Labatt was once called to deliver a child by means of craniotomy, in a case where a Medical Practitioner had been in attendance for two days, and where, when he went, there was found to be no child at all. I myself was once sent for by one of the best Medical students we ever had at this University, to perform the operation of version on a patient on whom he had been some hours in attendance, and which he fancied to be a case of unavoidable hæmorrhage. But turning of the child was unnecessary, as there was, in fact, no child to turn! The patient was suffering from menorrhagia as a termination of spurious pregnancy. There was a striking example of this disease in the Hospital here a few years ago. The patient was sent in from a distance in the country to be delivered of a child, of which she had been supposed to be long in labour. Her Medical attendant had had no doubt as to the reality of the pregnancy and the labour, and her husband, who accompanied her to Edinburgh, had as little. Their belief was grounded chiefly on the distinctness and force of the movements of the supposed fœtus, which were so marked and strong, as to lead the husband to maintain that if there was no child within his wife's abdomen there must be some animal there! The case was seen by Drs. Moir, Weir, and several other Medical men here, and all agreed that the movements were very deceptive; but on close examination they could be distinctly traced to the peristaltic action of the bowels. The uterus was perfectly empty. I have now seen two cases where the propriety of having recourse to the Cæsarean section was proposed in instances of spurious pregnancy. One of these has been fully and ably described by Dr. Keiller, in the *Monthly Journal of Medical Science*. In the other case I was called to perform the operation on a woman who was dying of some chest disease, and who was believed to have in her womb a living child. But there was no pregnancy whatever.

These symptoms of labour may all recur once and again, even in the same patient, and yet her faith in the reality of her pregnancy may remain unshaken. It is, indeed, most curious to witness with what persistence some such patients, but by no means all, will maintain their belief. The idea that she is in the family-way has such a firm hold of the patient's mind, that it looks as if her brain were impregnated and not her womb, and sometimes no kind of argument suffices to make her change her opinion. You may, it is true, succeed in convincing her at times that her hopes are futile, and you may fondly imagine that you have succeeded in utterly dispelling her empty expectations; but two or three weeks, or only days afterwards she will return to you as strongly impressed with the genuineness of her pregnancy as ever. No persuasion or eloquence of yours will almost ever lead her to give up her hope; time alone can prove to her how vain it is, and with some patients it takes a very long time too. I have known the idea obstinately persisted in even for years.

(To be continued.)

THE health of the population has been good during the quarter, being exactly the mean of the corresponding quarter of former years. In a few localities small-pox assumed an epidemic form, and had been fatal in many cases, but in only one case in which the deceased, a child, had been ascertained to be vaccinated. Scarlet fever in several instances had appeared epidemically, sometimes in the form of diphtheria, and had considerably increased the mortality. The weather during the quarter had presented several anomalies, of which the marked deficiency in the rainfall and in atmospheric moisture were the chief. The mean temperature had been slightly below the average.

ORIGINAL COMMUNICATIONS.

ON SYMPATHY BETWEEN THE TONSILS
AND THE OVARIES.

By M. PROSSER JAMES, M.D.

SEVERAL cases of tonsillitis, accompanied by ovarian suffering, coming successively under my care, led me to conjecture that some powerful sympathy between the affected organs may possibly give rise to frequent complications of the kind.

The following case, from notes taken at the time, will show how far such a theory may be entertained, and may also direct the attention of others to the subject. I am prepared to be told that a series of unusual coincidences may have brought these cases under my notice. On the other hand, it seems to me probable that many similar cases may have been overlooked by observant Practitioners through the throat symptoms absorbing their attention. This would be more liable to occur from the ovarian pain so generally extending into the lumbar region and coalescing, so to speak, with pain in the back. Patients might bitterly complain of "back-ache," and this would be readily regarded as a symptom of the pyrexia incident to the tonsillitis, whereas a more searching scrutiny might elicit the fact, previously unmentioned through female modesty, that pain in the inguinal region was equally, if not more, distressing. Since my attention has been directed to this topic, I have met with cases which I feel sure I should at one time have thus looked at, and which have impressed upon me that close attention even to familiar phenomena will not fail to interest and instruct.

On the evening of February 23 I was requested to prescribe for a single young lady, 22 years of age, of sanguine temperament and robust health, who, through imprudent exposure to damp, was reported to have caught a severe cold. On the 21st she was quite well, but yesterday was seized with rigor, followed by intense head-ache, sneezing, and some coryza. To-day, therefore, may date as the second day of the disease, and she now feels quite unable to remain up from excessive lassitude, head-ache, and pain in the back and limbs; in fact, she declares she "aches all over." She is thirsty, her skin hot and dry, pulse 90, tongue coated, fauces injected, and bowels rather confined. I prescribed a diaphoretic anodyne, to be followed by a saline aperient in the morning.

3rd day.—The medicine procured some sleep, but she feels no better. Headache somewhat relieved, but is still confused; throat seems dry and sore, and voice somewhat hoarse. On inspection, the whole fauces are much injected, and the tonsils swollen. Pain in the back and limbs exceedingly distressing; thirst and heat of the skin continue; pulse 95; tongue remains coated; bowels open once since the draught.

Towards evening she got worse, the fever being considerably increased, and she is very nervous and excited. The catamenia appeared to-day—one day before she expected—and were attended with great pain; never suffered such pain with a period before. Several doses of a saline diaphoretic have been given during the day.

4th day.—Tonsils swollen to a great extent, and tender to the touch, but no indication that an abscess has formed. Several minute superficial ulcers on the anterior part of the left tonsil were touched with nitrate of silver. She can swallow nothing but a little cold water.

5th day.—The nitrate was freely applied to the left tonsil, on which two specks remained visible. Respiration more impeded; pulse 100. Tongue more thickly coated with dirty white fur; bowels open once. An attempt to swallow a little thin arrowroot gave much pain, and some returned through the nose. A few grains of nitrate of potass mixed with sugar, to be put on the tongue in fine powder at intervals of three or four hours, so as to dissolve slowly, and come in contact with the throat.

6th day.—All specks have disappeared during the night, and the left tonsil seems somewhat less; at any rate the right is by far the larger. Has had no sleep, and is very excited and anxious. Respiration much impeded; pulse 120, and weaker; has taken no food; tongue getting brown; bowels not open. Catamenia are passing off, but there is a fixed, dull, aching pain in the right ovarian region aggravated

on motion. This was discovered from her dread of moving, on account of the pain in the back, which, on careful questioning, she said seemed to "come right through" to the groin, and when she moved almost made her sick. She lay a little inclined to the left side, with the right leg so drawn up as to take off pressure. On examination the pain is found localised to the ovarian region, which is hot and tender; very gentle, but prolonged manipulation detected a somewhat oval swelling, in which the pain was seated. Slight percussion in this spot was intolerable; but at a short distance could easily be borne, and detected a loaded state of the bowel.

The right tonsil (the larger and on the same side as the affected ovary) was freely scarified; and swallowing being so painful, a powder of calomel and morphia was placed on the tongue, and a black draught advised to be taken as early as she feels able. In the meantime poppy fomentations to the groin.

7th day.—Better. The scarified tonsil much less, so that the draught was taken with less difficulty. The bowels have been thrice freely relieved; but the operation of the medicines the first time greatly increased the ovarian pain, which then amounted to agony. This I attributed to the contact of hardened fæces with the ovary. The pain and tenderness are now much diminished. She is much calmer; pulse, 100; respiration easier; tongue covered with thin white fur; urine depositing sediment; has taken some arrowroot and jelly.

8th day.—The right tonsil continues decreasing; but the left has as rapidly enlarged. The ovarian pain is also gone, but only to reappear in exactly the same form on the opposite side. She is more excited, has lost her little appetite again, her throat feels more sore, is intensely thirsty, with a burning hot skin, has severe pain in the back continuing into the left groin and occasionally down the thigh; feels sick; tongue coated and brown; pulse 130 and weak; "has been wandering a little." Cold water and ices were gratefully taken. Free scarification of the left tonsil; a brisk purge, and warm flannels to the groin were employed with the same benefit as before. In the evening she expressed herself much better, and wanted to have the scarification repeated. She was far more composed, but still apprehensive and low spirited. Had taken by persuasion a little beef-tea. The bowels being quite free, a full dose of morphia was ordered.

9th day.—Slept nearly four hours. Disinclined to swallow anything from the extreme soreness of the throat: but having no repugnance to food, was persuaded to take some beef-tea. The tonsils are exceedingly tender, superficially, as if from the scarification, but are much less. The ovarian pain continues, but is duller in character. Respiration easy; pulse 100; tongue cleaner; a saline aperient, to be followed by an opiate; hop pillows to the groin.

10th day.—Better altogether; more cheerful; tongue clean; urine depositing sediment; pulse 95; complains of pain in shoulder; a dose of calomel and Dover's powder prescribed.

11th day.—During the night the ovarian pain became suddenly worse, and she was nauseated, and at the worst vomited. Still feels sick; pulse 95; weaker effervescing draughts, with one minim of dilute prussic acid in each, to be given at intervals of two or three hours.

12th day.—Much better in every respect; the sickness has left; the throat feels less sore; the pain in the groin is duller; she got up to-day.

From this time she gradually improved; the pain in the groin soon disappeared; and the tonsils slowly diminished under iodide of potassium, tonics, generous diet, and change of air.

Braintree.

CASES OF DIPHTHERIA,

WITH REMARKS ON

THE PATHOLOGY, SYMPTOMS, AND
TREATMENT OF THE DISEASE.

By J. S. BRISTOWE, M.D., F.R.C.P.

(Concluded from page 211.)

In some instances the affection of the throat may be such as of itself to induce dangerous or fatal effects. The inflammation, without being intense, may extend superficially; and,

involving the larynx, trachea, and even bronchial tubes, produce early death, with the usual symptoms of croup; or, extending down the œsophagus, cause serious and possibly fatal dysphagia. Or it may invade subjacent tissues, excite suppuration and sloughing, and hasten death by the superinduction of debility, conjoined probably with a typhoid condition.

It is certain, however, that the greater number of deaths are not produced by the direct operation of any such local causes, but occur, so to speak, as a natural termination to the disease. Thus, many patients sink at an early period, as in the analogous examples furnished by typhus, scarlet fever, and allied affections, not from any tangible cause, but from the degree and intensity of the poison taken into and operating in the system. And again, a still larger number droop and die of sheer exhaustion, after the disease itself appears to have left them, and while congratulations upon their recovery are still ringing in their ears. The progressive loss of strength and deterioration of blood, which lead to this latter termination, are probably in many cases simply due to a tendency inherited with and belonging to the disease itself. It must not be forgotten, however, that these are symptoms likely to accompany albuminuria, which is itself a sequel of diphtheria; and not unlikely to attend that form of lung disease, which was exhibited in two out of four autopsies which I have made or assisted in making. Indeed, I cannot help thinking it highly probable that the condition of lung here alluded to, may frequently, and when least suspected, be an important agent in producing death in the later periods of the disease; for it is scarcely possible that one-half of the substance of the lungs can have its function destroyed without dangerous consequences; and at the same time the condition producing this result is one that creeps on without special symptoms, and without adequate auscultatory phenomena.

Among the occasionally superadded symptoms, (none of which, however, are peculiar to diphtheria,) may be included a measles, I believe essentially purpurous rash, which I have known in two instances to appear shortly before death; paralysis of the soft palate accompanied by a nasal condition of the voice and difficulty of swallowing, which clearly arises from the effects of inflammation on the muscular tissue, and in one instance that came under my observation persisted for some weeks after the throat was apparently healed; deafness; impairment of vision, mainly presbyopia, which in the same case as that last referred to continued for a considerable period; and other imperfectly-developed paralytic symptoms.

(b) The diseases with which diphtheria is most liable to be confounded are scarlatina, tonsillitis, and croup. The chief points of distinction between it and scarlatina, putting the evidence that may be derivable from contagion out of the question, seem to be the more marked febrile symptoms which attend the latter affection, the cutaneous rash with subsequent desquamation, the enlargement of the fungiform papillæ of the tongue, and the usual absence of faucal false membrane; and by weighing these points of difference a correct diagnosis would be probably formed in the majority of cases. Yet it is important to bear in mind that, in some of the most malignant scarlatinal attacks, where the brunt of the affection seems spent upon the throat, the rash may be absent, the characteristic condition of the tongue may be scarcely marked, and febrile symptoms may be replaced by extreme depression and debility; and that if in such a case as this a false membrane be developed on the tonsils, as undoubtedly sometimes occurs, it would be almost, if not quite impossible, to distinguish the case *per se* from one of diphtheria. Simple tonsillitis, however severe in its character, would generally be sufficiently recognized by the presence of high febrile symptoms, so characteristically disproportionate to the danger of the affection; by the absence of false membrane, and by other less important characters, which need not be dwelt upon. There might, however, be some difficulty in distinguishing the ashy surface of the ulcers sometimes arising in such cases from the false membrane of diphtheria. As regards croup, the fact of the false membrane originating in the air passages, and only subsequently and rarely extending to the fauces, is probably an important distinction. Yet I cannot help observing that when one considers that the local inflammation is of exactly the same nature in croup and in diphtheria, and attacks surfaces bordering so closely on one another, that in its progress the boundary line is

constantly being transgressed, it must be often almost impossible to distinguish between them; and it is difficult to avoid suspecting that they have a more intimate relationship than is usually in this country admitted.

Treatment.—(a) It may, I believe, be safely affirmed that we are unacquainted with any specific capable of arresting the course of diphtheria; and, therefore, that our treatment, unless intended to be experimental, must, in the present state of our knowledge, be simply directed to the piloting of the patient in his progress through the disease, to the guarding him from any accidental perils, and, in the event of such befalling him, to the repairing of their ill effects. The main danger in the uncomplicated affection evidently arises from debility, and hence it has been properly insisted on by nearly all Practitioners that stimulants are desirable. And, further, since that debility often manifests itself fatally only at a late period of the disorder, it is obvious that the use of stimulants alone, the action of which can merely be temporary, is not sufficient, and can only be regarded as subordinate to the exhibition of nourishment, the effects of which, if slower, are yet solid and permanent. It is highly probable, I think, that at an early period of the disease antiphlogistics, administered with discrimination, may be useful; but, if so, the period during which they alone should be employed speedily passes away; and on the whole it is manifestly safer to ignore that period, and to adopt from the beginning the stimulant and nutritive line of treatment, than to persist one moment longer than needful in the opposite course. Under these circumstances it seems to me most important that stimulants combined with nourishment, should be commenced with early, and should be systematically persisted in. The amount of both, of course must depend upon circumstances; but in order to insure a sufficiency they should be judiciously varied, administered in small doses, but at regular and frequent intervals, and if rejected by the stomach, then given in the form of enemata.

(b) An important question is that having reference to the mode of treatment of the affection of the throat; and I may here at once state, as may have been inferred from the perusal of my cases, that I for one, disapprove of the application to the diseased surface of strong caustics and escharotics, and should prefer the employment in all cases of mild detergent gargles, or of warm milk, and such-like bland and soothing fluids. The reasons which have led me to discard heroic applications are the following:—1st. That the throat affection is merely a local evidence of a constitutional disease, which is unlikely to be arrested in its progress by any treatment directed to its secondary manifestations only. 2nd. That the throat affection rarely kills except by involving organs, such as the trachea and deeper tissues of the neck, which are beyond the region of the possible influence of such agents. 3rd. That even if the theoretical correctness of such treatment be admitted, the application of remedies to the surface of a thick false membrane, with the hope that they may affect the subjacent mucous tissue, is not only clumsy, but as regards the object intended, practically useless; and that the prior forcible removal of the membrane from the entire surface, in order to their efficient employment, is unjustifiable in the early stage, even if possible, and is likely only to be followed by increased inflammation, and reproduction of false membrane—by more real mischief, in fact, than the benefits presumably to be derived can possibly counterbalance. 4. That the application of such agents around the diseased tract, for the sake of limiting, should such be the intention, the spread of the disease, must, even if its efficiency be allowed, be an exceedingly difficult, and generally impossible operation; and from the tendency which the membrane has to spread from more than one centre, would probably, even if in the first instance thoroughly performed, become ultimately useless. Of course if a gangrenous state of the tonsils, or any other local complication supervenes, such topical applications are as commonly had recourse to in like conditions of the throat, should be employed; and in all cases, even from the beginning, such treatment should be directed to the exterior, as we usually resort to for the sake of allaying inflammation or relieving pain.

(c). As I have purposely refrained from going into details of treatment, even in regard to those two points which alone I have made the subject of remark hitherto, I have little to

add in order to carry out the intentions with which I started. There are still, however, a few considerations to which I may refer. I am not disposed to place much reliance on medicinal treatment during the earlier period of the disease; and, guided by general principles, should use such adjuncts only to the plan of practice sketched above as the condition or tendency of the case under observation might indicate; yet, at the same time, should carefully watch my opportunity for commencing the employment of tonics. Opium will sometimes be needful, and so also purgatives; but I should prefer the administration of the latter in the form of enemata. Lastly, any complications, renal, pulmonary, laryngeal, or whatever other they may be, need not, I imagine, any peculiar mode of treatment, but should be dealt with according to the principles which guide us commonly in our treatment of like affections arising under different circumstances; or, to be more explicit, we should endeavour to cure or obviate by ordinary means any secondary lesion which may arise, yet regulate our special efforts according to the general condition of the patient at the period of invasion of the superadded disease.

3, St. Thomas's-street, Southwark.

THE LONDON AND PROVINCIAL PRACTICE OF MEDICINE AND SURGERY.

REPORT ON

TUMOURS OF THE JAWS AND THEIR OPERATIVE TREATMENT.

DURING the last six years numerous cases have been mentioned in our Hospital Reports (statistical and otherwise) illustrating the pathology and surgery of tumours of the upper and lower jaw. These we now propose to bring together into a concise summary. We will take first those cases requiring severe surgical operations; and these it will be convenient to divide into two classes: first, those requiring resection of the upper jaw; and, second, those in which large portions of the lower jaw were removed. In both of these we of course leave unnoticed cases of necrosis, as the operations required in them are trivial as compared with those in which morbid growths are present. A third series of operative cases will comprise cases of epulis, and after this we shall, under their different heads, briefly review such other affections as occasionally require surgical interference.

Resection of the upper maxilla is emphatically one of the triumphs of modern Surgery. It is but thirty years since its first performance, and during that space of time it has been instrumental in saving many lives. Its victims have besides been very few, experience having proved that it is not really the very formidable procedure which conjecture might suppose. To Mr. Lizars (1827), of Edinburgh, is due the credit of having been the first to suggest and attempt it; and to Mr. Syme (1829) that of having been the first British Surgeon who performed it. In France, however, it would appear to have originated simultaneously, without any knowledge on the part of its proposer, of Mr. Lizars' case. In the same year as the latter was attempted, M. Gensoul, of Lyons, performed it, we believe, successfully. Since then it has been repeated by many Surgeons; among whom we must mention prominently Mr. Syme, Mr. Fergusson, and Mr. O'Shaugnessy. The latter Surgeon, in Indian practice, successfully employed it for the extirpation of an unusually large mass of morbid growth.

The following is a seriatim list of such cases as have been reported in our pages during the last six years:—

RESECTIONS OF THE UPPER JAW.

Case 1.—St. Bartholomew's Hospital, July, 1853.—In this case, Mr. Lawrence, excised the left upper maxilla, on account of malignant disease, commencing in the antrum. The patient recovered well, as far as the operation was concerned, but the disease rapidly returned.

Case 2.—St. Bartholomew's Hospital, October, 1853.—Mr. Stanley extirpated the entire bone with the exception of its nasal and orbital processes on account of a fibroid tumour which had returned after a former excision. The patient recovered well, and the extirpation was, we believe, permanently successful.

Case 3.—Charing-cross Hospital, October, 1853.—Mr. Hancock.—In this instance the excision was a complete one, the disease being suspectedly of a malignant nature. The patient recovered well.

Case 4.—Guy's Hospital, November, 1853.—A man, aged 50, under the care of Mr. Cock, on account of malignant disease involving the antrum and upper maxilla. Almost the entire bone was removed, and with a good result, inasmuch as the man quickly recovered. We believe, however, that the disease recurred within a short period.

Case 5.—St. Thomas's Hospital.—A married woman, aged 53, was admitted into St. Thomas's Hospital on November 29, 1853, under the care of Mr. Le Gros Clark. Her disease was a large malignant growth involving right upper jaw. The growth had been excised by a Provincial Surgeon about five months before, but had rapidly recurred. The whole duration of the disease was two years and a-half. Her general health was still pretty good. Mr. Clark performed excision of the affected maxilla, only the floor of the orbit being left. There was but little hæmorrhage. The woman made an uninterruptedly good recovery. She was still quite well when she came under notice again, six months afterwards, but we believe that eventually the disease returned. (See detailed notes, page 171, August 16, 1856.)

Case 6.—The Derby Infirmary, 1854.—The patient was a man, aged 49, in tolerably good general health. He was under the care of Mr. Fox, of the Derby Infirmary, for a tumour which had distended the antrum, and which had existed for nearly a year. The tumour was believed to be malignant, and it had grown forward, so as to protrude the cheek, and backwards so as to depress the soft palate. The case had been roughly treated by a quack doctor, prior to the man's admission at the Hospital, who had made incisions into it from the mouth, and had applied caustics. As no fungoid growths had followed these measures, it was hoped that the disease was not of the most malignant type. Mr. Fox excised the entire maxilla, adopting the plan of operating advised by Mr. Fergusson. After removal of the bone, such portions of the growth as had passed upwards or backwards were carefully removed by the scoop. The characteristics of medullary cancer were well marked in the tumour. The incisions in the skin soon healed, and the chasm left was rapidly filled by granulations, which were, however, of somewhat suspicious character. At the time the man left the Hospital there was reason to fear that the disease was already returning.

Case 7.—King's College Hospital, 1856.—A girl, aged 13, in good health, was admitted under Mr. Fergusson's care, on account of an osseous growth distending the left antrum. It had been observed to be increasing for three years. Excision of the greater part of the left upper maxilla was performed, the cheek having been dissected up after a single incision through the upper lip. In the osseous mass was one of the incisor teeth. The girl recovered well, and with very little resultant deformity.

Case 8.—King's College Hospital, 1856.—A man, aged 56, under the care of Mr. Fergusson, on account of a very large osteo-encephaloid growth in the left upper maxilla. It was of twelve years' growth, and he was much reduced in health. An incision, which involved the upper lip only, having been practised, the cheek was dissected up, and room enough gained to permit of the removal of the entire maxilla. No great amount of blood was lost. Death, with symptoms resembling those of commencing pyæmia, occurred on the fifth day. At the autopsy pus was found in the glands and cellular tissue of the neck.

Case 9.—King's College Hospital, 1856.—A girl, aged 16, under Mr. Fergusson's care for a large osseous growth, involving the right upper maxillary and malar bones. The whole maxilla and part of the malar bone were removed, the only external incision being through the upper lip. The girl recovered well, and left the Hospital about a month afterwards.

Case 10.—King's College Hospital, 1856.—A girl, aged 10, under Mr. Fergusson's care. The entire right upper maxilla was excised by the usual operation. The disease proved to be tuberculous deposit in the antrum and surrounding bone. The child, we believe, recovered well.

Case 11.—The Liverpool Royal Infirmary, 1856.—A healthy married woman, aged 23, was admitted under Mr. Bickersteth's care, on account of a solid and hard growth under the left cheek, which caused general enlargement of that side of

the face. It was of seven years' growth, and had increased painlessly. In the mouth the left side of the palate was found to be pushed downwards. The case had all the features of an osseous tumour of the antrum and maxilla, and the entire bone was accordingly removed by the usual operation. In extricating the bone, profuse hæmorrhage suddenly occurred, from the tearing of a large artery (probably the internal maxillary), but it was arrested by ligature, the carotid having meanwhile been compressed. The patient had an attack of erysipelas afterwards, but she ultimately recovered well. The tumour when sawn across proved to be a bony growth, occupying the interior of the antrum, the whole of which it filled with the exception of a small space capable of holding a pea.

Case 12.—King's College Hospital, 1857.—A robust-looking man, of middle age, in whose left upper jaw a tumour had been growing for upwards of four months. The growth extended across the mesial line in the palate, and also involved the malar bone of the opposite side. The whole of the involved maxilla and parts of the malar bones were resected in the usual manner. The man recovered quickly, and was discharged well six weeks afterwards, but Mr. Fergusson expressed himself as having grave fears that the disease would recur.

Case 13.—The Leeds Infirmary, 1857.—A woman, aged 22, was admitted under Mr. Teale's care on account of a large fibrous growth, originally developed within the right upper maxilla, but which in its growth had also involved parts of the left. Excision of the entire right bone was performed, a considerable portion of the left being also removed. The operation involved the loss of much blood, and the patient sank exhausted and died the following day.

Case 14.—The Queen's Hospital, Birmingham, 1857.—A woman, aged 55, under Mr. Langston Parker's care, on account of malignant disease of the right upper maxilla. Excision of almost the entire bone was performed on April 21st. The growth was found to occupy the cavity of the antrum. A good recovery resulted, and at the date of report (four months after) there was no evidence of return of the disease.

Case 15.—The Salford Royal Hospital.—A healthy-looking woman, aged 42, under the care of Mr. Thomas Windsor. The right cheek was distended by a firmly-fixed tumour, which had been growing for four months, and had ulcerated through the palate. On April 15, 1857, Mr. Windsor excised the entire bone, which, however, broke into fragments during the removal. There was but little bleeding, and the woman did well for the first twenty-four hours. Subsequently diffuse inflammation of the cellular tissue of the neck followed. From this and from erysipelas of the face she sank on the fourteenth day. The disease was soft cancer, and had begun in the antrum.

Case 16.—St. Thomas's Hospital, July, 1858.—A lad, aged 18, under the care of Mr. Simon, on account of a large polypoid tumour developed in the left upper maxilla. Malignancy was not suspected, but it was evident that the base of the growth could not be got at without extirpation of the bone. The entire maxilla was accordingly resected, and the polypus, which had an exceedingly broad base of attachment to the cranium itself, was got away. The lad recovered well, and, as usual, with but little deformity. (For details, see *Medical Times and Gazette*, July 10, 1858.) (a)

Case 17.—The London Hospital.—In this case a man, aged 43, under the care of Mr. Adams, had his left upper maxilla excised, on account of a polypoid growth filling the antrum. He made a good recovery.

We have arranged the above seventeen cases in the subjoined table.

It will be seen that out of the seventeen only three ended fatally. In several others, there was, however, the disappointing sequel that the disease was malignant, and quickly returned.

(a) We have omitted from this list a case of resection of the entire upper maxilla, performed by Mr. A. G. Field, of Brighton, in June, 1858. It is not clear from Mr. Field's report of it (which appeared as an original communication in the *Medical Times and Gazette* for August, 1858), whether the case occurred in a Hospital or not. The age of the patient is not stated, nothing is said as to the real nature of the disease, as disclosed after the operation, nor is it quite certain whether or not the man recovered. This case is, therefore, too incomplete for our purpose.

TABULAR STATEMENT OF RESECTIONS OF THE UPPER JAW.

Number.	Sex.	Age.	Bone affected.	Nature of Disease.	Result.	Cause of Death.	Remarks.
1	Left	Malignant.	Recovered	..	The disease rapidly returned.
2	Fibroid.	Recovered	..	Believed to be permanently well.
3	Malignant.	Recovered	..	The disease rapidly returned.
4	M	50	..	Malignant.	Recovered
5	F	53	Right	Malignant.	Recovered
6	M	49	..	Malignant.	Recovered	..	The disease was believed to be returning.
7	F	13	Left	Osseous.	Recovered	..	Permanent recovery.
8	M	56	Left	Osteo-encephaloid, 12 years.	Died.	Commencing pyæmia fifth day.	The tumour was very large.
9	F	16	Right	Osseous.	Recovered	..	Permanent recovery.
10	F	10	Right	Tuberculous	Recovered
11	F	23	Left	Osseous, 7 years.	Recovered
12	M	45(?)	Left	Malignant, 4 months.	Recovered
13	F	22	Right	Fibroid.	Died.	Exhaustion 1 day.	The tumour was very large.
14	F	55	Right	Malignant.	Recovered
15	F	42	Right	Malignant.	Died.	Erysipelas, etc. 2 weeks.	In good health at time of operation.
16	M	18	Left	Polypoid.	Recovered	..	The polypus grew by a broad base from the skull itself.
17	M	43	Left	Polypoid.	Recovered	..	The polypi occupied the antrum.

OTHER CASES OF MALIGNANT DISEASE OF THE UPPER JAW.

At page 476 of this Journal, for November 7, 1857, the reader will find some particulars of a case in which there was little doubt that the upper jaw was involved in a cancerous growth. The patient was a healthy-looking young man of 23, under Mr. McWhinnie's care, in St. Bartholomew's Hospital. The performance of excision was declined on account of the growth having advanced too far upwards to permit of it. The right side was affected, and the disease had existed only seven months.

In September, 1854, a man, aged 25, was under the care of Mr. Richard Hey, in the York Hospital, for a malignant tumour occupying the antral cavity. Mr. Hey cut away the front wall of the antrum and scooped out the morbid growths. The parts healed, but we do not know the final result of the case.

An especially interesting case has also been recently under notice, in which a boy from the country, under Mr. Critchett's care at the Ophthalmic Hospital, had cancer of both upper jaws. The disease appeared to have developed itself symmetrically, but from quite distinct points in the two bones. In each instance it grew upwards and displaced the eye. The boy died within a year of its commencement.

RESECTIONS OF PORTIONS OF THE LOWER JAW ON ACCOUNT OF TUMOURS.

Case 1.—The Winchester Hospital, 1853.—In this case Mr. Butler excised the right half of the lower jaw on account of a malignant growth from the periosteum. The tumour had been growing for two months, and after removal presented the characters of epithelial cancer. In the course of a month after the operation, and before the wound was quite healed, the disease had returned. Death resulted three months later.

Case 2.—St. Thomas's Hospital, June, 1854.—A man, aged 28, cachectic, and of very nervous temperament, was under Mr. Mackmurdo's care for malignant disease developed within the bone. It was growing rapidly, and expanding the bone on its exterior. The left half of the jaw was excised; the operation being attended with but little loss of blood. The patient did well for about ten days, when he was attacked by erysipelas, under which he sank about a fortnight after the operation. The tumour after removal proved to be of the fibro-plastic or myeloid class. No examination of the viscera after death was permitted.

Case 3.—A Provincial Hospital, 1854.—A woman, aged 40, in very feeble health had excision of the right half of her lower jaw performed on account of a large fibrous tumour, which had been developed within it, and had been steadily

increasing for upwards of three years. Soon after the operation a severe attack of diarrhoea, with menorrhagia, came on, and occasioned much exhaustion. Symptoms of pyæmia subsequently developed themselves, and death followed on the thirty-third day. At the autopsy pus was found beneath the scalp, and there were deposits in the lungs and muscular substance of the heart.

Case 4.—King's College Hospital, April, 1855.—A healthy man, aged 31, was admitted under Mr. Fergusson's care on account of a large tumour in the left side and front part of the lower jaw, which had been slowly increasing for more than three years. The excision involved the removal of the bone from the anterior edge of the left masseter, as far forwards as the canine tooth on the right side. On dissection the bone was found occupied by cysts which contained a gelatinous fluid, its external layer having been expanded until as thin as parchment. The patient recovered well after the operation.

Case 5.—Addenbrooke's Hospital, Cambridge, 1856.—A healthy-looking man, aged 28, was admitted in November, 1856, under Mr. Humphrey's care, with a large tumour, resembling an epulis growing from the lower jaw. It was of a year's duration, and involved nearly the entire depth of the bone from the first bicuspid to the second molar. In the operation an incision was carried from the angle of the mouth downwards and backwards nearly to the angle of the bone. The saw was next used, and the tumour, with the whole of the tract of the bone involved, excepting a mere rim at its lower border, was removed. The wound quickly healed, and the man was discharged in about three weeks. Under the microscope cells resembling those of cancer were found.

Case 6.—The Liverpool Royal Infirmary, 1856.—A healthy-looking man, aged 25, was admitted, under the care of Mr. Bickersteth, with a tumour growing from the lower jaw of nine weeks' duration. It had during that period been twice excised by a Surgeon under whose care the man had formerly been, but on each occasion a rapid recurrence took place. During the few days he was under Mr. Bickersteth's observation prior to the operation, it increased in size very rapidly. The horizontal ramus of the jaw was excised to within a short distance of the symphysis. The patient recovered well, but a return of the disease was much feared.

Case 7.—The Liverpool Royal Infirmary, 1856.—A spare man, aged 62, for six months the subject of a firm tumour in the left side of the lower jaw. It was about the size of a walnut, and had been painful. Excision of the portion of jaw from which it grew was performed, and the man recovered well. At the time he left the Hospital, however, the disease seemed to be returning.

Case 8.—King's College Hospital, 1857.—The subject of this interesting case was a woman, aged 23. When 16 years old, she had first observed a tumour forming in the right side of the lower jaw. This was excised, together with part of the bone, by Mr. Pettigrew. The disease soon returned, and for some time the patient declined to permit any further surgical interference. When admitted, under Mr. Fergusson's care, into King's College Hospital, she still presented the aspect of good health; but the tumour was of large size, involving the angle and ramus of the bone. Mr. Fergusson resected the whole from the first molar tooth to the articulation. The bleeding at the time was very free, and it returned in the course of the evening. Death from collapse followed the next day. The disease proved to be of myeloid structure, and the fact of its recurrence became therefore of especial interest.

Case 9.—The Leeds Infirmary.—In this case the portion of the lower jaw resected was not very large. The patient was a man, aged 33, who had had an epithelial cancer excised from his lower lip about nine months before. Although the cicatrix remained quite sound, he noticed about four months after the operation that the jaw was enlarging. The tumour slowly increased, and became painful. Excision of the affected part of the bone was performed, and with a good result, as the parts healed soundly.

Case 10.—Charing-cross Hospital.—In this instance no distinct tumour existed; but the operation required was the same. The bone was much enlarged, and carious at parts, as the result probably of constitutional syphilis. The patient was a sailor, aged 32. Mr. Hancock cut away the left half of the bone from its angle posteriorly to near the symphysis in front. The parts healed well.

Case 11.—The "Great Northern" Hospital, June, 1859.—A girl, aged 17, was admitted for the second time under the care of Mr. Lawson. About eight months before, a fibrous-looking tumour growing from the periosteum of the left side of the lower maxilla had been removed. The disease had recurred, and now involved the ramus of the jaw in a tumour of considerable size. The ramus of the jaw was excarticated, and removed together with the tumour, which grew from its surface. It was found impossible to get away the whole of the growth, as it had spread into the adjacent structures. The girl did well afterwards, but Mr. Lawson had but little hope that the disease would not rapidly recur. It appeared to be of fibroid recurrent character.

TABLE OF RESECTIONS OF PORTIONS OF THE LOWER JAW.

Number.	Sex.	Age.	Bone affected.	Nature of Disease.	Result.	Cause of Death.	Remarks.
1	M	..	Right	Malignant, 2 months.	Recovered	..	The disease returned, and he died in four months.
2	M	28	Left	Myeloid.	Died.	Erysipelas, 2 weeks.	The man was in bad health.
3	F	40	Right	Fibroid, 3 years.	Died.	Pyæmia, 33rd day.	The woman was in very feeble health.
4	M	31	Left	Cystic, 3 years.	Recovered	..	
5	M	28	..	Malignant, 1 year.	Recovered	..	
6	M	25	..	Malignant, 9 weeks.	Recovered	..	
7	M	62	Left	Malignant.	Recovered	..	A return was feared.
8	F	23	Right	Myeloid, 6 years.	Died.	Exhaustion, 1 day.	The tumour was very large.
9	M	33	Left	Malignant.	Recovered	..	It was secondary on cancer of the lip.
10	M	32	Left	Syphilitic enlargement	Recovered	..	The bone was enlarged and carious.
11	F	17	Left	Fibroid recurrent.	Recovered	..	The tumour grew from the periosteum of the ramus.

CARTILAGINOUS AND FIBRO-CARTILAGINOUS TUMOURS.

Tumours consisting only of cartilage, and resembling those so often developed in the phalanges of the fingers, occur occasionally in connexion with the jaws. They are, however, decidedly infrequent. Mr. Fergusson exhibited to the Pathological Society, in October, 1854, a specimen of this form of tumour, about the size of a hen's egg, which he had removed from the jaw of a woman aged 39. It had existed most of her life, and occupied the interior of the bone between the symphysis and the mental foramen, being encapsuled by a thin, osseous shell. Mr. Fergusson remarked that the disease was undoubtedly rare, and that he had never before seen so good a specimen of it. The reporters upon this specimen (Dr. Beale and Mr. Gray) considered it to be more of fibrous than true cartilaginous structure, but Mr. Fergusson describes it "as resembling enchondroma, as seen in the phalanges of the fingers." At a meeting of the Pathological Society during its last session, Mr. Hutchinson showed a fibro-cartilaginous tumour, about the size of a pigeon's egg, which he had excised from the canine fossa of the right upper jaw. The tumour had been movable, occupying a depression in the bone, but not growing from it. The tumour consisted largely of true cartilage. The patient was a girl of about 15, under care at the Metropolitan Free Hospital. Mr. Fergusson, who was President of the Society at the time, remarked that such growths in connexion with the jaws were, according to his experience, very unusual. But the best example of cartilaginous tumours growing in the jaws with which we have recently been made acquainted, is one, the particulars of which Dr. Adams, of the Richmond Hospital, Dublin, recorded in this Journal for April 11, 1857. In it "the whole body of the lower jaw was expanded into a bony cyst, or shell which enclosed within it a cartilaginous-like material." The excision required, involved the removal of the articular head as well as the body and ramus. The patient was 36 years of age, and the disease had followed a blow received three years before. These tumours are, of course, perfectly innocent. They usually commence in early life and grow very slowly.

EPULIS.

In the following list of examples of Epulis which have been operated on in our various Hospitals, and recorded from time to time in our statistical reports, we have included several in which there was much doubt as to whether the tumour was not really malignant. But in truth, in respect to these tumours of the gum and alveolus, it is often very difficult to estimate their degree of deviation from the benign standard. The fibrous epulis is certainly not malignant, but it often returns after free excision. The myeloid epulis stands on more questionable ground, will ulcerate and fungate, and now and then may cause enlargement of glands, while a third class presents itself which is more suspicious, whilst yet not by any means possessing clear and positive characteristics of cancer. Our data have not enabled us in the following list to distinguish between Fibrous and Myeloid, but we have mentioned the circumstance, whenever the disease was believed to be malignant.

TABULAR STATEMENT OF TWENTY-EIGHT CASES OF EPULIS.

No.	Sex	Age	Duration.	Position	Result.	Remarks.
1	F	35	..	Upper.	Recovered	
2	M	39	15 months	..	Recovered	
3	F	60	7 months.	Upper.	Recovered	
4	F	50	3 months.	Upper.	Died.	Rigors followed the operation, and death from pyæmia on the 15th day.
5	M	16	3 years.	Lower.	Recovered	
6	F	60	20 years.	Upper.	Recovered	Very large indeed. It had returned after removal 8 years before.
7	F	26	9 months.	Lower.	Recovered	Large, ragged, and fungating. It was fibro-cartilaginous.
8	M	36	..	Upper.	Recovered	It was thought after removal to be of cancerous nature.
9	M	27	7 years.	Upper.	Recovered	The tumour was thought to be cancerous after removal.
10	F	28	6 years.	Lower.	Recovered	The tumour consisted of hardish bone, and had encapsuled completely the stumps of two teeth.
11	F	11	..	Lower.	Recovered	
12	F	36	18 months	Lower.	Recovered	Caused by a decayed tooth.
13	M	24	Recovered	
14	F	30	..	Upper.	Recovered	
15	F	23	14 months	Lower.	Recovered	Two bicuspid teeth were buried in it. It was of myeloid structure.
16	F	22	2 years.	..	Recovered	It involved two teeth.
17	M	16	1 year.	Lower.	Recovered	It involved the last bicuspid and first molar.
18	F	31	..	Lower.	Recovered	The tumour was soft and fungoid.
19	F	30	..	Lower.	Recovered	
20	M	9	Recovered	
21	F	22	..	Lower.	Recovered	
22	M	40	Recovered	
23	M	40	Recovered	It was ulcerated, and considered to be malignant.
24	M	10	..	Lower.	Recovered	As large as a walnut.
25	M	51	..	Upper.	Recovered	
26	F	47	5 months	Upper.	Recovered	
27	F	24	..	Lower.	Recovered	The bleeding which followed required the actual cautery for its arrest.
28	F	73	Recovered	The tumour was pedunculated, and was removed by ligature.

Of these 28 cases in which tumours growing from the gum, were of the character usually designated as "Epulis," we may make the following summary:—In but one instance did the operation cause the death of the patient, whilst in all the others the parts implicated are stated to have healed soundly. It would appear that the female sex is more liable to this disease than males, in the proportion of 5 to 3, the numbers in the list being 17 females and 11 males. This may perhaps be explained by reference to the fact, that stumps of decayed teeth are by far the most frequent exciting causes of these growths. Now, women are, for several reasons, more likely to retain useless stumps of teeth than men. They are far more patient as regards severe, unavoidable pain, such as that of toothache, and at the same time much more afraid of surgical pain, as that of tooth extraction; besides, it must be remembered, that the conditions either of pregnancy or lactation prevent many women from having their decayed teeth taken out at the times when they ache.

As it regards age, we find that the youngest patient was a

boy of 9, and the next to him a girl of 11, whilst the oldest was a woman of 73, and the next to her another woman of 60. Five were under the age of 20; eight between those of 20 and 30; seven between 30 and 40; three between 40 and 50; two between 50 and 60; and three above 60. The average of the whole is 33.

The lower jaw seems rather the more frequent seat of epuloid tumours. In twelve out of twenty-one cases in which we possess information on this point, the growth was from the lower gum, and in nine only from the upper.

It is a curious fact, that epulis tumours are hardly ever seen in the front gum, but almost invariably at one or the other side. Of course, the greater extent of the lateral regions, and the fact that for each central tract there are two lateral ones, explain this to some extent. The increased irritation of the many-fanged molars, as compared with the incisors, must be taken also into the account.

MULTILOCLAR CYSTIC DISEASE.

In Case 4 of the above series of excisions of parts of the lower jaw, the disease is stated to have consisted of numerous cysts filled with gelatinous material, which occupied the body of the bone. The osseous shell was, in many parts, as thin as parchment. A parallel case to this has also been recorded by the Dublin Surgeon just alluded to (Dr. Adams), and will be found (with a good woodcut) at page 485 of this Journal, for May, 1857. The patient was a man, aged 36, and the disease had existed for three years. As in Mr. Fergusson's case, the cysts were developed in the body of the lower jaw, and almost a similar operation was required. In the same report Dr. Adams refers to (and figures the specimen) a third case of cystic disease of the lower jaw, which had been recorded by Mr. Cusack many years before.

FIRM FIBROUS TUMOURS.

In January, 1858, Mr. Cock had under his care, in Guy's Hospital, a boy, aged 9, in whom a tumour was embedded in the left side of the lower jaw, near to its symphysis. The growth had followed a blow received two years before. It was excised, and proved to be a firm fibrous tumour, of about the size of a walnut. It was not encapsuled in the bone at the time of the operation, but occupied a depression in its surface. It surrounded the mental nerve, and had probably been originally developed in its canal. Respecting several of the cases in the above series in which the term "fibroid" has been used, we are at some loss how to class them. Some so described were possibly truly fibrous; others probably of myeloid nature; and others, again, very closely allied to cancer, or, at any rate, to the recurrent fibroids. The above is the only undoubted instance of an ordinary fibrous tumour developed in connection with either jaw, that has recently come under our notice.

EXOSTOSIS FROM THE LOWER JAW.

In one instance Mr. Erichsen removed from near the symphysis of the lower jaw an exostosis of moderate size, which had been increasing several years. The patient was a woman, aged 22. This is, we believe, the only example of exostosis developed in this situation which our lists contain.

RECURRENT FIBROID TUMOUR DEVELOPED IN THE ANTRUM.

The only example which we have to quote of recurrent fibroid tumour developed in connexion with the jaws is one in which the diagnosis of that variety of tumour and true cancer is by no means positive. It is that of a woman, aged 34, under Mr. Cock's care, in Guy's Hospital, at different times for two or three years (1854 and 1856). The growth occupied the right antrum, and extended into the nose; on several occasions Mr. Cock dissected up the cheek in front, laid bare the cavity, and gouged out the tumour and the bone to which it was attached. The parts always healed quickly, but the disease soon returned. The tumour had the microscopic features of a recurrent fibroid, as distinct from those of a true cancer, and the fact that it continued to recur in the same place, but did not cause disease of the glands, is confirmatory of that diagnosis. The woman was very pallid and cachectic, but her cachexia did not exactly resemble that of cancer. We lost sight of her towards the end of 1856, and do not know the final result of her case. Probably she has since died of her disease.

CYSTIC DISTENSION OF THE ANTRUM.

Several good examples of cystic distension of the antrum have been recorded in our pages during the period now under review. In this curious affection the antral cavity becomes filled with a glairy mucous fluid closely resembling that of ranula, the outer wall is distended and thinned, and the cheek becomes visibly full and swollen. Often on touching the cheek, a sensation of crackling as of paper is produced, owing to the extreme thinness of the external osseous wall. On opening the antrum it is found of great capacity, but not containing any morbid growths, either solid or membranous. The disease is, therefore, rather a distension of a natural cavity than a true cystic formation. It would appear that women are more subject to this affection than men.

The following are examples of it:—*Case 1.*—A woman, aged 31, was admitted in October, 1855, into Guy's Hospital, under the care of Mr. Cock. Her right antrum was so distended that the osseous wall in front had been wholly absorbed. Mr. Cock dissected upwards between the cheek and gum, and cut away with strong scissors as much as possible of the front wall of the cyst, which was tough and fibrous. The glairy contents having been evacuated, the cavity was stuffed with sponge and left to suppurate. When the woman left the Hospital the cyst appeared to have been obliterated.

Case 2.—Under the care of Mr. Teale, in the Leeds Infirmary. It was necessary to employ bone forceps in cutting away the front wall of the dilated antrum.

Case 3.—A girl, aged 14, under the care of Mr. Hilton, in Guy's Hospital, on account of a large prominent swelling of the left upper maxilla. Mr. Hilton diagnosed a cyst, either in or connected with the antrum. The operation consisted in dissecting up the gum and soft parts, and then with a strong pair of scissors opening the front wall of the swelling, which consisted of thin and expanded bone. Nearly two ounces of thick glairy fluid escaped. Some lint was afterwards introduced into the wound. After some slight suppuration, during which a lotion of the sulphate of zinc was used as an injection, the cavity filled by granulation, and the wound closed. The cure was complete, and all deformity of the cheek subsequently disappeared.

Case 4.—The patient was a woman of about 35, under Mr. Hutchinson's care in the Metropolitan Free Hospital. The cyst had been opened several times, but always when the puncture closed it refilled. On one occasion, at another Hospital, an attempt had been made to prevent the opening from healing, but unsuccessfully. In front was a thin shell of bone. Mr. Hutchinson laid the cyst freely open, and stuffed it with sponge, which was left in for four days. After the removal of the sponge, injections of chlorate of potash were employed to correct the fetor of the discharge. It is believed that the obliteration was complete.

CYST IN THE UPPER JAW, ENCLOSING A TOOTH.

Of this peculiar class of cases we have but one example, which is as follows:—

A young woman, aged 18, admitted into Guy's Hospital under the care of Mr. Cock, having for some time suffered from a painful swelling of the gum of the left side of the upper jaw, over the incisor teeth. An incision had been made into it by a Surgeon who had previously seen her, and a portion of gum removed, but without benefit. It was found that the permanent lateral incisor tooth of that side had not appeared, and that its position was still occupied by a small deciduous one. Mr. Cock's diagnosis was that the tumour was probably connected with some mal-position of the permanent tooth. Mr. Salter, the Dentist to the Hospital, saw the patient, and extracted the deciduous tooth, which was found firmly fixed, and its fang unabsorbed. No further information as to the nature of the swelling in the jaw was gained by this measure. Mr. Cock determined, accordingly, to open the swelling and examine. This was done by means of small bone forceps, by which, after the gum had been detached, a portion of the anterior part of the jaw, just above the alveolar process, was cut away. A cavity of irregular shape, and about capable of containing a large marble was laid open, and after some search the wanting tooth was found at its further extremity. The tooth was a large, fully-formed, permanent incisor, beautifully white, and complete in every respect, excepting that its fang ter-

minated abruptly in a rounded end at about its middle. The wound was left to heal by granulations, which it rapidly did without any inconvenience. It is intended, by the aid of the Dentist, to have the tooth fixed in the position it should have occupied.

SATURDAY, SEPTEMBER 3.

WHAT IS THE MEDICAL ATTENDANT'S DUTY IN A CASE OF SUSPECTED POISONING?

THE conduct of Dr. Julius and Mr. Bird, and to some degree that of Dr. Todd, in the case of Miss Bankes, has excited much attention and some sharp criticism both from members of their own Profession and in non-professional circles; and a point of very great practical importance in Medical ethics, which was raised in the case of Wooler in 1855, has been again discussed, and must receive from the Profession generally the most attentive consideration.

The various charges against the Medical attendants on Miss Bankes have been put very strongly by Mr. Edmunds, one of the witnesses for the defence, in a very able letter which he has addressed to one of the daily papers. He says:—

"Dr. Julius says his suspicions were aroused more than three weeks before the death, and Dr. Bird says that a week later they were corroborated by his own; yet these two allow their patient to go on for two weeks without taking any step. In a quarter of an hour they might have tested the patient's urine, and without any overt act of suspicion they might have displayed the poison or dispelled their suspicion; yet they do nothing. No, not even introduce a new person into the sick-room, nor even call in another Medical opinion; but after two weeks Dr. Todd is summoned, and not at the instance of these doctors, but at the reiterated request of the prisoner.

"Accepting their statement, was this conduct in accordance with common sense? Common sense repudiates it. Does their treatment bear out their opinions, and prove them to have been the convictions of the time? No; it disproves them. They treated her with metallic medicines, proper for the disease of which (if not poisoned) she died, but aggravatory for a case of poisoning.

"Dr. Todd sees her for a few minutes, notes an expression of countenance in no way associated with poisoning, but distinctly referrible to disease. He says she is suffering from irritant poison, prescribes for dysentery, and leaves for town. Why did he not treat her for poisoning? Why did he not prescribe an antidote?

"Dr. Taylor is the only man who seems to have believed in poison, and he, acting on his belief, naturally prescribes an antidote."

We do not propose at present to enter into the questions here raised as to diagnosis and treatment. In a case of suspected mineral poisoning, it is clearly the duty of the Medical attendant to have the urine analysed by a competent chemist, if he has not the means at hand for applying Reinsch's process or the modification of Marsh's process proposed by Berzelius; and the faecal evacuations should be treated in the same manner. It is equally clear that if poison be detected, the treatment should be modified accordingly. Our attention

now must be directed to the ethical question—What are we to do in a suspicious case—a case where suspicion has not ripened into certainty?

The Judge (Baron Martin) in his charge to the jury at Wooler's trial, not only blamed the Medical attendants of the deceased, but he pointed out what their conduct ought to have been in his opinion. He said that, "when the *idea of poisoning struck them*," if they did not suspect the husband, they ought to have communicated their suspicions to him; but if they did suspect him, "they ought to have gone before a magistrate, and not have gone on from the 8th of June to the 27th, *seeing the woman murdered before their eyes*." Sergeant Wilkins, the prisoner's counsel, had previously indulged in far more bitter, and therefore less telling, censure. In a most scurrilous attack on the Medical attendants, he said their conduct was "infamous in the extreme," and "but for that infamous conduct the poor woman would now be alive."

In the Smethurst case, Sergeant Parry, in the course of his very able argument, animadverted in a more dignified style, but with a similar purport, upon the conduct of Dr. Julius. But the Lord Chief Baron in his charge completely exonerated the Medical witnesses. He said, "he thought they could not have acted otherwise, and that it would have been very wrong to make known their suspicions until they had been confirmed. The expression of an unfounded suspicion might bring the most serious legal consequences upon the incautious Doctor. An action for slander, or, if the charge were written, for libel, might entail heavy damages: while the distress of the patient's family, of the accused person, and the injury to the professional reputation of the suspicious man, would be beyond all calculation." We give these words from recollection, having heard the charge. They have not appeared in any report we have seen, but they express the spirit and very nearly the exact words of the Judge.

Thus, one Judge thinks suspicion should be expressed as soon as "the idea strikes;" another thinks it should not be expressed until it has been "thoroughly confirmed." When two men so learned in the law differ so widely, a poor Doctor surely should not be treated very harshly for differing with either, or with both. But we do not wish to escape from a difficulty on any such plea as this,—let us meet it fairly, and determine the important questions:—1. When are we to declare our suspicions that a patient is being poisoned? 2. To whom are we to declare them? and 3. What steps can we take, in a case of mere unsupported suspicion, to stop the further possible administration of poison, and thus save the life of our patient?

1. When are we to declare our suspicion that a patient is being poisoned?—On this point we must quote a passage from Dr. Christison's admirable commentary on the case of Mrs. Wooler:—

"There are various degrees of suspicion. A Physician being puzzled with the nature, grouping, and course of the symptoms in a case, suddenly the question starts up unbidden before him—*Might not poison produce them?* But, for a time, he thinks no more of it. This is suspicion, in the lowest degree—'the first motion'—but suspicion, nevertheless. Presently the same idea crosses him again, shaped now by the farther progress of the case into the fact, that arsenic might explain all. Natural disease, however, or a combination of natural diseases, might equally supply an explanation; and so he dismisses the idea a second time from his mind, or, for a moment, thinks merely of the fact at which he has arrived as a curious coincidence in the manifestations produced by quite different morbid agents. But he has arrived at suspicion of a deeper shade. By and by, casual observation, which, with his very peculiar opportunities, he cannot elude, forces on his notice non-medical incidents, which point at a guilty agent, probably among those who minister to his patient's wants and helplessness, possibly a relative, and very possibly even the nearest in life. His heart, however, revolts at the supposed atrocity, and for a time he repels the thought

as too odious. Thus at length suspicion truly possesses him; still, however, 'like a phantasma, or a hideous dream,' vague and possibly altogether erroneous. Closer observation, new facts, medical or moral, or both, embody the phantasm into a substantial shape. He is now thoroughly roused; he resolves to turn his fears to certainty, or banish them entirely; he therefore proceeds to examine the urine. Suspicion exists no longer; arsenic is there; and his patient has been positively poisoned."

Such was the situation of the Medical attendants on Mrs. Wooler when Dr. Christison found arsenic in her urine. Such was the situation of Drs. Julius and Bird when Dr. Taylor found arsenic in the evacuation of Miss Bankes. The second question then arose,

2. To whom should the suspicion be declared?—When chemical evidence has confirmed a previous suspicion, there can be no question as to the propriety of applying to a magistrate. This Dr. Julius did. The more delicate question is, how to act before suspicion has become so thoroughly confirmed. According to the Lord Chief Baron Dr. Julius did quite right in "waiting for further evidence." According to Baron Martin he stood inactive while a poor woman was being "murdered before his eyes." The case is one of acknowledged difficulty. Supposing Dr. Julius had divulged his suspicions to Smethurst himself, what might have been the consequence? The purpose might have been abandoned for a time; a monstrous criminal might have escaped for a time without punishment; and the victim might have been removed to some more retired spot, and her end accelerated at some more favourable opportunity. If, adopting the other course, Dr. Julius had applied to a magistrate earlier than he did—if the suspicion had been erroneous, his character and fortune might have been lost; while, if well-founded, as the criminal could not have been imprisoned on mere suspicion, he would have been liberated on bail, or as he actually was when first apprehended, on his own recognizance, and thus have had the opportunity of removing all traces of poison. Neither of the judges, or any of the newspapers, or their numerous correspondents, seem to have thought of a third course which was open to Dr. Julius, and which is always open to a Medical man in a similar difficulty. Dr. Julius might have communicated his suspicion to *Miss Bankes herself*. There might have been some danger of the alarm so excited proving very injurious to her; but in a case where there is so much difficulty on all sides, no course of action can be entirely free from objection. Once her own suspicions had been aroused, the repetition of poisoning would have been most surely prevented. Indeed, as Dr. Christison says in the paper we have previously quoted:—

"In cases of poisoning it will be commonly found that the patient is not unaware of the real state of things, and that he has been concealing his own convictions of poisoning. And not only so. It may farther appear that he suspects the guilty agent, and can fasten the crime upon him, and will do so on finding that his Physician has penetrated his secret. We have an example in the remarkable case of Mr. Blandy. When his Physician, Dr. Addington, had convinced himself that the old gentleman was dying of the effects of arsenic, he broke the truth to his unfortunate patient, who, thereupon disclosed his whole domestic horrors, by fixing the agency on his own guilty daughter."

We think it may be laid down, then, as a general rule, that in all cases of suspected poisoning, the Medical attendant should first communicate his suspicions to the patient.

3. This leads us to say a few words as to other measures which may be adopted to preserve the patient from possible danger. (a) The possibility of all supplies of poison should be cut off. This might be done even before any suspicion is divulged. It would be quite possible to *insist* that a confidential nurse or relative should be placed in attendance on a patient, and that all food, drink, and medicine, should be prepared and administered by this person. Strong objections

to such a course would lead to more or less explicit explanation. It might give the alarm to the guilty person; but the first duty of the Medical man is to protect his patient. (b) Chemical analysis of the excretions should be undertaken without delay, and (c) Any previous treatment should become subordinate to that rendered necessary by the effects of the poison, and the administration of an antidote.

None of us can tell how soon he may be placed in circumstances similar to those which have proved so trying to our brethren at Richmond. Let each one be prepared beforehand to act upon the lessons taught by this case, and to pursue a course of conduct which will protect the patient, and will neither interfere with the course of public justice, nor throw unfounded suspicion upon an innocent person.

THE WEEK.

AN unsophisticated person, who is untrammelled either by official ties, or who is not committed by previous assertion to any one particular course of action, would, after perusing the different facts which have been made public in reference to the purifying of the Serpentine, be necessarily driven to the conclusion, that the only right way of doing the business is to do it thoroughly. It must be clear to every man, who is not already committed to any given course, that the plan proposed by Mr. Hawkesley is a "thing of shreds and patches." It takes no notice of one most grievous defect in the Serpentine—its unfitness as a suitable bathing ground for the multitudes. This part of the subject has been very well exposed by Mr. Chadwick. He shows that a considerable annual income would be saved to the Humane Society, by preventing the necessity of the Society keeping up their establishment in Hyde Park, if bathers and skaters could follow their avocations without danger. Besides, Mr. Hawkesley's plan does not provide for the removal of the animal and other materials, which are dissolved in the water; and what a scheme it is which requires the occasional sprinkling of the banks with lime to keep down the weeds! It is impossible to say what absurdity may not be committed by a man in office, who has not the courage to confess himself guilty of an error; but we do sincerely hope that Mr. Fitzroy will allow his own good plain common sense to prevail in this matter, and not allow such quackery to be practised merely for the sake of keeping up an appearance of governmental consistency.

As the Election of Fellows of the Royal College of Physicians (which, as our readers will remember, has been adjourned for a time) must shortly take place, we would again venture to call the attention of those concerned in the selection of fit and proper men, to a suggestion which has been already made in this Journal. It is, we think, tolerably evident, that, however anxious the Council of the College may be to dispense justice in this matter, they may nevertheless fail in doing so; and for the reason that it is scarcely possible the claims of all the different Licentiate of the College can be fairly brought before them. There may be many gentlemen, whose names are scarcely known to the Council, and who may notwithstanding be men every way fitted for sustaining the honour of the Fellowship. Now how is the Council to be made acquainted with these gentlemen? We would suggest what seems to us a most simple and efficacious means, by which the Council might be greatly assisted in their selections, and the wishes of the great body of the Fellows fully carried out. The suggestion is, that Fellows of the Council should privately and by letter recommend to the Council for selection the names of those Licentiate whom they consider worthy of the honour. If this were done by the body of the Fellows, the Council would be at once surely directed in their choice. A proposi-

tion having no doubt this object in view was proposed as one of the new Bye-laws affecting the Fellows. According to this proposal six Fellows might sign a paper recommending any Licentiate to the Council for the Fellowship. This proposal, however, was rejected, and for the obvious reason that it would have undoubtedly opened the door to the canvassing of Fellows for their signatures by Licentiate; and everybody knows how hard it is to refuse a paper of this kind when placed before him by a friend. Now what we propose gives all the advantages which might be derived from such recommendations by the Fellows; and we may be sure that the recommendations would in this way be a real test of the candidate's merits, for they would be given voluntarily, and not under the pressure of friendship. We cannot but think that the Council would do well to invite the Fellows thus to assist them. It must be remembered that, in the Election of Fellows, the Electing Body of Fellows must take or reject those Licentiate who are proposed to them for election by the Council; no other names can be substituted for those which may be rejected. And for this reason, therefore, it is especially desirable, and above all times during this period of grace, that no Licentiate should be unduly neglected by accident.

The Royal Orthopædic Hospital held its half-yearly meeting of governors last week. The report speaks of immense benefit rendered to the crooked-legged and footed; and tightness and deficiency of funds. The expenditure, in fact, exceeds the receipts; 24,652 patients have received the benefit of the institution since its opening. What good it does, may be judged of from the following report in the *Times*:—

"Patients from all parts of the world entered the wards cripples, and were sent out cured, and many, very many, who had never walked before, had walked out of this Hospital perfectly cured. Among several cases of this description, three adults had been discharged with straight and useful limbs, after having been unable to walk or even stand for more than twenty years. Two of these were country patients."

We are reminded of the days of miracles:

"The Dumb shall sing; the Lame his crutch forego,
And leap exulting, like the bounding roe."

A fortnight ago, we alluded to a "cute Yankee dodge," practised upon the "Britishers." A patient who addressed a letter to the "Institute," in compliance with the terms of the advertisement, sends us the following delicious specimen of benevolence as the reply he received:—

American Botanic Institute, Liverpool,

August 14, 1859.

Sir,—For deafness take two pills every night (as per enclosed recipe), and use as follows:—1 ounce ox gall; $\frac{1}{2}$ ditto pale brandy; $\frac{1}{4}$ ditto essence of wintergreen; well mixed: drop 4 drops into the ear night and morning.

If you cannot get the wintergreen at your chemist's, you can procure it from the Apothecaries' Hall, or from here for fourteen postage-stamps.—Yours obediently,

J. P. HARRISON, Secretary.

DR. BEAUMONT'S SPECIFIC

For all Diseases arising from Indigestion, such as Flatulency, or Wind in the Stomach, Bilious or Liver Complaints, Dimness of Sight, Nervous or Sick Headache, and all Disorders arising from a weak and debilitated state of the Digestive Organs, and Liver.

Extract of gentian, 2 drams; extract of camomile, 2 ditto; extract of dandelion, 4 ditto; extract of the root of vacilla, 5 ditto; powdered Turkey rhubarb, 3 ditto; oil of aniseed, 10 drops; oil of peppermint, 10 drops.

Make the above into 3-grain pills, and take two pills every night at bed-time. They will not interfere with the general routine of business, inasmuch as they do not cause sickness or nausea, and no particular dietary is requisite.

The "Vacilla," which was discovered by Dr. Beaumont while on a tour in the back-woods of America, is little known

to the Medical Faculty or to Chemists, in consequence of which there may be some difficulty in procuring it; and to obviate this, the Directors of "the South Lancashire and Cheshire Botanic Society," at a great cost, procured a quantity direct, which is made into pills as above, a box of which will be forwarded to any address on receipt of an envelope, with two stamps, to cover the postage, and twenty-four stamps, the cost of the pills. To very poor persons, they will be forwarded gratis; but it is hoped that those who can afford, will forward to the Secretary the amount named, that being the first cost of the ingredients used.

Persons also in indifferent circumstances, but not so poor as to require the pills gratis, will, it is expected, forward whatever they can afford, towards assisting the Directors in their humane undertaking. And all classes are requested to make known to the Secretary, by letter, addressed to the Institute, the effect produced by this medicine.

American Botanic Institute, 152, Park-lane, Liverpool.

Two shillings' worth of Vacilica, or one shilling's worth of Wintergreen, may be had at prime cost, by any deaf person, from the kind American Doctor, who is *not registered* in this country!

The glorious 32nd Regiment, of Lucknow celebrity, last week returned to England from India; and on Saturday last were inspected by the Queen at Portsmouth. The regiment came home in charge of Dr. Boyd, who so greatly distinguished himself during the siege. At the inspection her Majesty desired that the Lucknow men should be called to the front, and expressed her wish to see Dr. Boyd, who was accordingly presented to her Majesty by Colonel Bell, commanding the regiment. Her Majesty expressed her gratification at seeing Dr. Boyd again returned to England from India, and also at the appearance of the men in general.

The Medical officers of the East London Union have lately presented to the Board of Guardians a memorial for increased remuneration for their services but the Guardians have peremptorily refused to comply with the demand. The Medical officers consequently issued a circular on the 12th ultimo, calling attention to the facts on which their memorial was based, and expressing a hope that the subject may be reconsidered, and that their request may be ultimately granted. The memorial states that the total amount paid by the Board of Guardians as annual salaries, to the district Medical officers is, both relatively and actually, unremunerative and inadequate, and this assertion is supported by a comparative view of the Medical statistics of the three London Unions. The East London Union is densely crowded, for there are 290 persons to every statute acre, compared with 240 in the West London, and 106 in the City Union. The yearly number of sick poor in the East London Union, on an average of three years, is 7003; while in the City Union the number of sick averages 2939, and in the West London, 3672. Being reduced to proportions, the City furnishes in Medical cases to the Union officers 1 in 19; the West London, 1 in 7½; and the East London, 1 in 6½ of the whole population. It is admitted that this last-named Union pays more than the others to the Medical officers, but it is maintained that the sums paid are not *in proportion* to the duties performed; for that, comparing the salaries with the number of persons attended, the Medical officers of the East London Union receive only 10½d. per case, and each case is said to extend, on an average, to more than fourteen days, and to include both attendance and medicines. A further complaint is, that by the employment of midwives in the East London Union, the amount received as extra fees is proportionately very much less than the similar items received in the other two City Unions. Of these extra fees the City Union pays, on an average, 9d. per case; the West London, 9d. per case; but the East London pays only 2½d.

per case. Thus, by every comparison, the East London Union pays much less than the other two Unions, although the Eastern district is the most densely crowded of the three, and entails consequently much more labour on the Medical officers. Such are the representations which have been made to the Board of Guardians and to the rate-payers, and it really appears that the remonstrances of the Medical officers of the East London Union deserve more consideration than has hitherto been bestowed upon them. The guardians will probably think it expedient to reconsider the question.

FOREIGN CORRESPONDENCE.

FRANCE.

PARIS, AUGUST 15, 1859.

IN your number of July 23rd there appears a letter from Dr. Handfield Jones, containing some remarks on my report of the treatment of a case of acute peritonitis by the sulphate of quinine in large and continued doses as I had seen it carried out by M. Beau at the Hôpital la Charité. The tendency of these remarks is to show that Dr. Jones has no great faith in the medication employed by M. Beau, in the treatment of this formidable disease, particularly as occurring in connection with "English peritoneums." He further hints, that in registering cures following on the quinine treatment, there is just a possibility "that M. Beau may have been deceiving himself" in committing the too common error of confounding the *post hoc* with the *propter hoc*—the invariable stumbling-block in the reasoning of common minds.

As the Correspondent of a leading Journal like the *Medical Times and Gazette*, I do not conceive it my duty to defend every new theory, which I may record, or every new-fangled practice which may by chance come under my observation; it is my part, rather, to give an impartial account of such theory or practice, leaving their merits to be discussed by the Profession, and their defence, in case of need, to those who desire to promulgate them. For these reasons, I do not mean to constitute myself the advocate of M. Beau on the present occasion. But M. Beau, being a foreigner, the remarks of Dr. Jones may never meet his eye; hence I deem it expedient to exculpate him so far from the charge implied in one portion of Mr. Jones's letter, viz. that which refers to the possibility of his having deceived himself in his estimate of the part which the quinine played in the case in question, as recorded in No. 470 of the *Medical Times and Gazette*. I have followed the practice of M. Beau sufficiently long to enable me to form a tolerably accurate judgment, both of his observing and his reasoning powers, and of both I have formed a very high opinion; and if it can in any way enhance the value of his practice, or give weight to his views in the estimation of those who may be disposed to cavil at them, or reject them as absurd, I have much pleasure in recording my conviction that I do not consider him a man likely to seek for the verification of any theory he may hold, in the mere sequence of coincident and unconnected events. On the contrary, although like many of his professional brethren here, he is full of zeal and ardour, leading sometimes almost to hobbyism, I believe him, nevertheless, to be under the influence of a strictly rational logic; basing his conclusions on a careful and conscientious observation of facts.

While watching the progress of the case in which these remarks have originated, I was as incredulous of the efficacy of the quinine treatment as anyone possibly could be, and it was only on remarking the rapid and decided impression made on the disease during the exhibition of the drug, and the ultimate recovery of the patient, that I was constrained to inquire whether the recovery was not a mere fortuitous occurrence, and independent altogether of the medication employed. My first inquiry was addressed to M. Beau's intelligent chef de clinique, and by him I was assured that a similar result, under the same circumstances, was not of uncommon occurrence; and that the powerful curative effects of large doses of quinine in peritonitis, as well as in inflammation of serous membranes generally, are by him too frequently observed to admit of any doubt on the point. This statement was besides amply corroborated by M. Beau himself, in his

lecture, a few days afterwards, in which he stated that he had tried all the different systems of treatment vaunted in the management of peritonitis, and that he had found none so effectual as the exhibition of quinine in large and continued doses, regulated according to the tolerance of the patient and the violence of the malady. For several years past he has employed no other, either in cases connected with the puerperal condition, or apart from that state. With him it is no expectant treatment, but one in which he recognises a powerful instrument for good, and in no case has he seen any ill effects follow it. It may be true, as Dr. Jones remarks, that all, "nerve toners are tissue irritants," and that quinine given in what he styles the sthenic form of peritoneal inflammation might, from its property as a general tonic, prove injurious. This can only hold good, however, when the quinine is given in small doses. If it be given in doses of from one to two grains, or thereabouts, at moderately distant intervals, it produces a tonic influence, imparting vigour to the system generally; but the experience of late years has proved beyond a doubt, that in doses of eight or ten grains administered every eight hours, it produces a very powerful sedative influence on the entire nervous system, and especially on that portion of the ganglionic system which presides over the functions of the circulation and the production of caloric. In this respect, according to M. Briquet, who has experimented largely with the sulphate of quinine, it should be classified with opium and digitals, both of which it resembles in its stupifying and sedative action.

If this view of the physiological action of the sulphate of quinine in large doses be correct, then this medicine must prove, if not useful, at least not injurious, in the treatment of the sthenic form of peritonitis to which, if I have understood him aright, Dr. Jones considers it inapplicable. The object which in all cases of general inflammation should be steadily kept in view, is its subjugation by such means as are least likely to be followed by reaction. Now, we all know that when bleeding has been had recourse to, reaction almost invariably takes place, and the re-establishment of the inflammatory process, which for a moment may have been interrupted, reappears often in an aggravated form. If bleeding be an evil even in the sthenic form of inflammation, a doctrine which is held by not a few in the Profession at the present day, how much more is the practice to be deprecated in those forms known as asthenic?—and it is especially as regards this latter type that the treatment pursued by M. Beau is deserving of attentive consideration. His theory is, that in the great majority of cases of peritonitis, there is found, prior to the outbreak of the disease, an impoverished condition of the blood, manifested in the diminution of its red globules, and in a proportionate increase of its fibrinous element; and that where such a condition of blood exists, there is a manifest tendency or predisposition to peritonitis, or to any of the other phlegmasiæ. A moderately strong exciting cause, such as exposure to cold, or undue fatigue, is under these circumstances calculated to call it into activity. The anæmic condition is, so to speak, according to this practitioner, the almost invariable *cachet* of the phlegmasiæ. By way of more thoroughly understanding M. Beau, and for the purpose of testing the sincerity of his views, I, in the course of conversation with him, asked him whether he believed in the existence of the purely sthenic form of peritonitis. He replied, "If such a form exist, it must be very rare, for I have seldom if ever met with it." "But," I rejoined, "we can imagine peritonitis occurring in the case of an individual strong, vigorous, and healthy, in other words, in a man whose blood is in a perfectly normal condition and abundant in quantity, as the consequence of a bayonet wound penetrating the peritoneal covering, would you not in such an instance expect to find the inflammation assuming the sthenic form?" "In such a case," he replied, "I would hardly expect peritonitis at all, inasmuch as the person receiving such an injury would be in the very best possible condition to resist the inflammatory process; at all events he would not be so liable to it as an individual previously debilitated, and in whose case there is an excess of fibrin as compared with the normal quantity of this material in healthy blood. Let but such an accident happen to the latter, and peritonitis is almost sure to follow." It would thus appear that so far, M. Beau and Dr. Handfield Jones agree, inasmuch as the latter, while attending to the conditions or grades of inflammation, admits that the sthenic form is rare, and that the asthenic, together with a form intermediate between

the two are by far the most common. I have thus given as complete an *exposé* of M. Beau's views as the limits of a letter will admit of. With such views, it is hardly necessary to add that he considers venesection altogether out of the question in the treatment of peritonitis.

The disease being one of debility, such a practice can but tend to increase it, and would really be tantamount to pouring oil on a fire for the purpose of putting it out. His sheet-anchor is the sulphate of quinine, with which the system of the patient must be invaded as near the commencement of the disease as possible. To effect this, from twenty to thirty grains of the drug must be administered in the twenty-four hours, taking care always to proportion it to the sensibility of the patient and the gravity of the symptoms. The state of "quinism," or quinic intoxication, generally follows the second or third dose, and consentaneous with this the heart's action becomes lowered, the heat and other febrile symptoms disappear, and the local pain ceases. M. Beau considers it essential that the patient be apprised of the very peculiar effects which the medicine is likely to produce, in order that he may not be alarmed in mistaking these for an aggravation of the original disease; the deafness and ringing in the ears being in some cases so great, that in the absence of this precaution, a bad moral effect might be the consequence. It sometimes happens that the local symptoms continue after the fever has disappeared, and the case then becomes one of a chronic kind. When this takes place, the treatment of M. Beau is exceedingly simple, consisting in the application to the abdomen of a series of blisters; the quinine, he believes, exercises no influence whatever over the local morbid products. During the stage of convalescence he endeavours to correct the anæmic condition of the patient, not by the administration of iron, but by supplying the system with nutritious food. In closing my remarks on this subject, I may mention that M. Beau treats all cases of acute rheumatism which come under his care on the same principle, and by the same medications. The treatment is purely substitutive in its character, consisting in the displacement of pathognomonic symptoms by others of a strictly physiological kind, the one class being incompatible with the existence of the other.

For the last three weeks the Profession here has been much occupied with the discussion of a new discovery for the treatment of gangrenous sores, and others characterised by abundant and fetid suppuration. A number of experiments have been made with it on the human subject in the Hôpital la Charité, under the auspices of MM. Velpeau and Manec, as well as on animals at the Veterinary School of Alfort, the results of which have been communicated to the Académie des Sciences, and to the Académie de Médecine, before both of which learned bodies they have been warmly discussed, and, on the whole, very favourably received. The authors of the discovery are MM. Corne and Demeaux, the former a Medical Practitioner in the South of France, the latter a Veterinary Surgeon. This disinfectant, or absorbent, is composed of two very simple substances in given proportions, viz. 100 parts of common plaster of Paris, with from one to five parts of coal tar. These two substances are triturated in a mortar, or by means of some other suitable mechanical apparatus, the result being a greyish powder, having somewhat the appearance of prepared chalk, and possessing a moderately strong bituminous odour. It may be applied to the surface of sores simply in the shape of powder, or it may be used in the form of an ointment produced by combining the powder with a certain quantity of olive oil, the consistency being determined by the greater or less quantity of oil employed in its preparation. The oil (unlike water, which would set the plaster,) causes the particles simply to cohere in such a manner that it, by the gradual elimination of the oil, still retains the property of absorbing the pus so long as it remains in contact with the suppurating sore; a certain portion of the ointment is spread over a piece of rag proportioned to the dimensions of the sore, and is applied to it either directly, or a layer of some thin texture is made to interpose, according to the nature of the case or the object contemplated. Its direct application to a sore does not produce the slightest irritation. According to Velpeau this application, besides absorbing the pus and other morbid products engendered on the surface of sores, possesses the double advantage of disinfecting them, and so favours cicatrization. I have followed

MM. Corne and Demeaux in their experiments at La Charité, and have carefully observed the effect produced on different kinds of sores by their new mode of dressing; and on the whole, I have been very favourably impressed with it. I do not, however, wish to be rash in forming my opinion as to its merit until it shall have been more severely tested. One thing I have remarked, viz., that its application to sores of the most unhealthy and fetid description, is immediately followed by the disappearance of all smell; but whether this is owing to its chemical action on the morbid product, or simply to its absorbent power, or to its bituminous odour predominating over every other, I cannot say, this being a question which remains to be settled by practical chemists. I have seen the powder applied to anatomical specimens in an advanced state of putrefaction, and the consequence has been the apparent arrest of the putrefactive process, together with the destruction of the peculiar odour which accompanies it.

GENERAL CORRESPONDENCE.

THE COLLEGES OF PHYSICIANS.

[To the Editor of the Medical Times and Gazette.]

SIR,—May I venture to offer a few remarks on the proceedings of the two Colleges of Physicians since the passing of the Medical Act, and point out what, according to the views of many well-informed persons, must be the influence for good or ill on the Profession of what has been already done, or what may yet result from the preponderance of the conservative or the reforming spirit in the resolutions which they may adopt for the future? The London and Edinburgh Colleges, though alike in name, and intended to comprise the same class of persons, have stood in very different relations to the Profession and the public, in consequence chiefly of the exclusive privileges conferred on the London College, by which it was penal for any man to practise as a Physician within seven miles of London, except he had received their licence. And although it be true that the penalty has not been inflicted for very many years, that no attempt even has been made to enforce compliance with the statute, yet every man who wished to stand well with his own Profession felt himself bound to submit to the law, and to unite himself to this body. In Scotland there was no such monopoly granted, and consequently no one cared to apply for the licence, or to place himself in the lower grade, except with the certainty of being afterwards made a Fellow. In process of time Licentiates ceased to exist, and that College practically became merely a Fellows' club, exercising scarcely any appreciable influence on the character of the practitioners of medicine in Edinburgh, and maintained simply by the feeling of respectability which attached to the membership of a select body from among one of the best educated classes of Scotland. I think it important to remember this result, when the London College is spoken of, because if they proceeded on the same general plan on which they have acted hitherto, they must as the necessary consequence of their privileges being abolished, become the exact representative in London of their Scotch prototype. It will always be an honour to be a Fellow in common with all the distinguished Physicians of the metropolis; and probably men of a certain calibre will always be found who will submit to the licence examination, however severe, with a view to being ultimately elected Fellows; but with the exception of such persons, the class will almost cease to exist, unless some new motive can be found to induce men to become simple members of the College: and thus its influence will be restricted to a very small section of the Profession.

It is much to be regretted that such a state of things has become law; that the Universities can now confer along with an honorary title a licence to practise, while the Colleges of Physicians can only give the latter, and have no power to create Doctors of Medicine, or allow them to add the mystical letters M.D. to their names. This result was not owing to any want of energy or representation before the law was passed: it was then urged, and not urged in vain, that the honorary title should be kept as distinct from the licence as the M.A., the B.D., or the D.D. were kept from admission to holy orders in the Church.

The Colleges of Physicians had lost their *prestige*, partly perhaps through their own fault, and we cannot now go back to the *status quo* before the Act was passed. It must be accepted by the Profession as the rule by which they are to be guided for the future; and, as it is the duty of every licensing body to require a standard of qualification calculated to fit the man for the place he is to fill, the Universities will make their examinations such as soon to dissipate any distinctions which may still be traced between a Graduate who belongs to a College of Physicians and one who does not. Each year the M.D. will be more and more recognised as the Physician, and what will then be gained by being a Member of the College? It has been the practice with many to find fault with this body, and to speak of their want of liberality, and exclusiveness, and it seems to me impossible for them to act, as they have hitherto done, without a rivalry being set up between their own class and all the discontented spirits who are ever ready to arrogate to themselves the glory of being alone the supporters of liberal views; and such a result is very likely to drive the College ultimately into the very course which they have always sought to avoid, viz., making the Fellowship a mere question of a canvass and a ballot, and, as the College of Surgeons has already done in their department, throwing down to a great extent the barrier which yet exists between the Physician and the General Practitioner. It may be questioned by some whether this barrier ought to be maintained,—whether there is any advantage in the distinctions which now exist,—whether it would not be better that we should be all Physicians, all Surgeons, and all General Practitioners at the same time? My answer to this is very simple:—If the M.D. implied such an education as Oxford, Cambridge, London and Edinburgh combined could produce,—if all Surgeons had passed the London Fellowship Examination,—if all General Practitioners combined these two merits, and such a condition of the Profession could be hoped for or expected here below, by all means have but one Faculty. But if life be too short, and the powers of man too limited, to attain such an ideal standard,—if every examining body admits a different degree of proficiency in conferring their licence to practise, it becomes of importance that a separate race of Hospital Physicians and Surgeons should be encouraged to elevate their respective departments to the highest possible level.

What then constitutes a Physician? The Colleges would find answer, The possession of our diploma. Parliament replied to this with a direct negative; the Executive Medical Council reply, That they cannot sanction such a prerogative; and it is vain for these bodies to endeavour one moment longer to maintain the paradox that they alone can make Physicians, when the only power ever possessed of this kind has been ruthlessly swept away. The name, which through means of the existence of the London College has been better defined here than elsewhere, simply means, one who has applied more than the ordinary time to the study of Medicine; who has very generally had such an education as entitled him to take the degree of M.D. (when it was worth having); who has, or hopes to have, large opportunities of studying disease, and teaching others in a public hospital and school (a Doctor in the true sense); who, moreover, is entitled to and receives larger remuneration for his services than other Practitioners, and from his known acquirements is considered competent to advise them in difficult cases; and for the sake of enabling the public to discriminate between himself and the less distinguished grades, he agrees not to supply, directly or indirectly, medicines to his patients, but to leave them to be provided by the ordinary attendant or to be purchased from the chemist. The more clearly the College of Physicians limit themselves to this class in the selection of Fellows, and the more comprehensive that selection is, so that no creditable Hospital Physician is left out, the better will be their position in the Profession. Except in the details of the mode of election, and the attempt to secure this object more thoroughly than has yet been done, it does not appear to me that any great change is to be expected in the feelings of real Physicians, or the class whom it is desirable to elect as Fellows, in consequence of the late changes in Medical politics. There are a great many so-called Physicians, who are merely costly General Practitioners, and no one wishes to see that class increased, or if they place themselves among the Members of the College by passing the examination, to see them raised to the honour of the Fellowship.

I cannot doubt that the list of "Members" will decrease, and that some changes will need to be made, if it is desirable to keep up their numbers; but what these changes ought to be, I am not prepared to say. At the same time, I cannot help expressing the opinion that the London College acted wisely in determining to call them "Members," to give them certain privileges (which I hope will not be few), and to add to their numbers by admitting, during one year, all who were practising as Physicians in England without their licence. For, by whatever rules this admission may be criticised, the intention of the College is unmistakable; their object was not to confer any honour, not to raise to a new dignity without examination; but merely when this dignity had already been assumed with any show of justice, and no *fama* attached to the man's name, to endeavour to embrace all such persons under one common title, as Members of the College of Physicians.

A far different object has been pursued by the Edinburgh College, and it cannot be denied that the English General Practitioners, who have sent their money to Edinburgh, have done it under the false impression that they would be created Physicians without examination—Physicians belonging to perhaps a less distinguished College, but Physicians all the same. This has been a great misfortune, because it has so greatly complicated the proceedings of the London College. It was evidently recognised as their intention, in the published outline of their proposed new Charter, to provide for a third class, or one corresponding to the General Practitioners at present licensed by the Society of Apothecaries, who should for the future hold a licence from themselves; when suddenly they have found themselves face to face with a body of highly respectable gentlemen no doubt, but gentlemen who, not pretending in any way to be Physicians, have still received a sort of brevet rank from the Edinburgh College, which, according to the provisions of the new Charter of the London College, would be entitled to rank on a level with the best of their "Members" on mere payment of two pounds. In this consists the essential difference between the action of the two Colleges: the one was willing to take into its membership all *bona fide* Physicians; the other sought to confer the dignity of Physician upon General Practitioners. Both have failed in their object, because the purpose of the movement has not been defined or understood. The Physicians of England have grudged ten pounds to place themselves avowedly in a separate class, and have distrusted the management of the self-elected body of Fellows. The General Practitioners do not see that an indiscriminate conferring of the title of Licentiate of the College of Physicians of Edinburgh will add dignity to their position; and they know full well that the appellation of Physician will not be accorded to them,—a name which the Edinburgh College, indeed, never meant them to take, or attached any importance to. It will be a great misfortune for the Profession and the public if this premature step leads to the abandonment of the purpose that the ordinary class of Medical men should receive their licence to practise Medicine from the College of Physicians, as they do that to practise Surgery from the College of Surgeons. In this matter there will be plenty of competition: the M.B. Lond. will especially put in its claim for the second qualification; the Society of Apothecaries do not yet retire from the field,—perhaps they may come forward with increased vigour, and make still further improvements upon the scheme of instruction, which they have already raised much above its original standard. The College of Physicians will only do real good in entering the list of competitors, if they stick to those principles which have always characterised their examinations—viz., the variable nature of the Board of Censors, which renders examining so difficult; the position of the men selected to fill that office,—men still in the prime of life, and yet distinguished by their literary and scientific attainments; and last, not least, the practical character of the study required. Based upon such principles, a licence for ordinary Medical practice emanating from the College of Physicians will do much to elevate the Profession, and will be acceptable to all.

But I must say one word on the opposition which it is known some Physicians make to this innovation. The whole force of the objection resolves itself into this, that it is feared that the distinctions raised between the different grades will be swept away, that all will claim to be on an equality, and so the dignity of the Physician will be lowered, and the rank ultimately disappear altogether. Now, while I fully admit

that it will be difficult for unprofessional people on consulting the new Register to distinguish the relation which each person may hold to the College, it is to be remembered that this state of things has been forced on Physicians by law: they have no legal status as Physicians at all! So far as registration goes, it merely affirms that a man is legally qualified by having certain diplomas, and if the Register is to be made, contrary to the letter and spirit of the Act, a means of distinguishing Physicians from non-Physicians, the only course for the College to pursue, would be to remove all distinction between Fellows and Members, and take upon themselves to register as of their number every practising Physician in England, without payment and without examination! This, of course, they are not prepared to do, and it is perfectly vain for the Fellows to imagine that the public will discern in that mystic name a something which constitutes a Physician, while such a highly-distinguished country Physician as Sir Charles Hastings never belonged to the College in any way, and the eminent adviser of Her Majesty declined the honour of the Fellowship. The standing of every man in public estimation must ever depend upon himself. No respectable Physician has ever felt aggrieved that the General Practitioner whom he meets in consultation has got a St. Andrew's degree, and calls himself Doctor, nor is he lowered one jot in the estimation of the public; how then can it possibly lower him if the same Practitioner, in place of receiving a licence from the Society of Apothecaries, has one from his own College? On the contrary, it appears to me that the higher the standing of the General Practitioner, the higher necessarily must be that of the man whose advice he seeks in consultation. It may be more difficult in such a case to distinguish between the Apothecary G.P. and the Physician G.P.; but the latter is an anomaly which ought not to exist, and if the public cannot see the difference, except in the fees they charge, I do not believe that the science of Medicine will at all suffer from the change. As to the Profession, I think no man will seriously maintain for a moment, that the new grade can in any way be confounded with the Fellowship or the Membership. Let the College but be true to itself; let them be careful that every new Fellow adds lustre and dignity to their body; that the standing of Physician is not lowered by the men on whom they confer the name, and they need entertain no doubt that the Profession will recognise their status in spite of Acts of Parliament, and that as the honour is coveted, so Medical men will strive to obtain it in the only legitimate way by making their own position such that the body of Fellows will gladly hail them as colleagues and fellow-labourers in the same field. We could all of us point to names which have been elected without any such qualifications—to names which have been passed over although they possessed them in an eminent degree; but of this it is not my purpose to speak, any further than to say that the selection of their Fellows is the sheet-anchor on which the fame of the College must rest, and that if they are guided by right principles in this, they may do all that they can to elevate the very lowest grade connected with medicine—the very shop-boy in the Druggist's shop—without any fear of compromising their dignity or lowering their standing.

I am, &c.

A PHYSICIAN.

IMPURITIES OF GREY POWDER.

LETTER FROM S. R. PITTARD, Esq.

[To the Editor of the Medical Times and Gazette.]

SIR,—Nobody who knows Dr. Thudichum can ever doubt his veracity in a matter of fact. At Dr. Smethurst's trial he stated that he had found arsenic and antimony, and other abnormal ingredients in grey powder. Are these frequently present in the grey powder commonly sold in London? In reply to this I beg to state that for several years before I gave up practice (four years ago) I had abandoned the use of grey powder entirely, because I found that it invariably made the patients who took it sick. I tried numerous samples, bought of various druggists, but they all alike produced vomiting. This used not to be an effect of the grey powder of former days, and last winter a friend gave me some manufactured by himself, which I used in the illness of some of my children, and it did not make them sick.

My friend, Mr. Steet, of Myddelton-square, without my having communicated the above to him, informed me that he also had found that all the grey powder which he bought produced vomiting, and that therefore he manufactures it himself.

This goes far to show that antimony and arsenic—one or both—are often present in ordinary grey powder. I have learnt from a person who has often been employed by manufacturing druggists, how, most probably, they get there. The mercury used to make grey powder, etc., is often the refuse of the silvering of looking-glasses—sold at about eightpence the pound. The mercury is used in this “silvering” process in conjunction with a foil,—said to be tin-foil, but really consisting of tin, lead, arsenic, and antimony,—which is dissolved by, and forms an amalgam with, the mercury. The mercury is used in great excess, and the surplus is rapidly squeezed out by pressure. It may be used over and over again several times, but at length it becomes thick (no longer quite fluid), and then it is no longer useable in the process. The thickness is of course due to the foil dissolved in it. My informant tells me that it is often used for making hyd. c. creta thick as received from the looking-glass makers; but it is manifest that even if it were distilled off, the tin and lead, the arsenic and antimony, being volatile, would pass over with it.

I saw Dr. Thudichum a few days ago, and he told me that the twelfth-of-a-grain doses was a mistake of the reporter's. I had believed that to be the case before I saw him.

I have sent the above twice to the *Times* newspaper, in answer to the letter signed “James Bird,” in the *Times* of August 20; but, as I anticipated, it was not inserted. I am on the “Taboo” list of the *Times* on account of a strongly-worded remonstrance against its insertion of “Cholera,” letters in 1854, I am not a little vain of this “Taboo,” because the late Sergeant Talfourd enjoyed the same distinction. For years, whenever he appeared in a law suit, the *Times* was seized with a fit of want of space.

Surely they won't hang Smethurst.

I am, &c.

21, Hans-place, August 31, 1859. S. R. PITTARD.

A HOMŒOPATHIC PRACTITIONER, Mr. W. Rae, has been committed for trial on a charge of manslaughter, with reference to the death of a Mrs. Poole, of Hendon-street, Pimlico, whom he attended in her confinement, and who died from hæmorrhage. It appeared that the friends of the deceased doubted his qualification, and repeatedly requested to see his diploma, which he refused to produce. She died after violent suffering. At the inquest Rae still produced no diploma, and the inference drawn is that he has none.

ANOTHER OF THE WATTERS GANG COMMITTED FOR TRIAL.—William Charles Allen, a young fellow who described himself as a Medical Student, and who appeared in discharge of his bail to meet a complaint preferred against him on a former day of assault and riotous and disorderly conduct in the Westminster-road, at an unreasonable hour of the morning, was charged before the Hon. G. C. Norton with being concerned, with two persons named Watters and Edwards, in defrauding several persons by representing themselves as doctors, and undertaking to cure all conceivable diseases, while, like their former associates, the Bennetts, the stuff they dispensed as medicine was of the most disgusting description. Mr. Benjamin Thomas Jones, of 75, Mount-street, Grosvenor-square, who had been the prosecutor in the case of Dr. Watters and Edwards, his confederate, identified the prisoner Allen as one of the persons he had seen at Dr. Watters's, in Mount-place, Westminster-road, and as the individual to whom he had paid 5s. on his first visit. On the apprehension of Watters and Edwards, the prisoner absconded, and, though Inspector Young had spent much time in endeavouring to trace and apprehend him, he managed to keep out of his reach. He was, however, included in the indictment with his companions, and a true bill was found against all three; and on the 8th of July last Watters and Francis were tried at the Old Bailey, convicted, and sentenced to eighteen months' hard labour each. The prisoner, who offered nothing in defence to the charge, was remanded, to give time to obtain a copy of the bill of indictment, as found by the grand jury, preparatory to his being sent to take his trial at the Central Criminal Court.

THE SMETHURST CASE.

THIS case is so certain to occupy an important position in the annals of poisoning, that we think it will be acceptable to our readers to be put in possession of the letters, or of the more important portions of the letters, which have been addressed either to the Home Secretary, or to some of the daily papers, by Medical or scientific men. As a general rule, we deny the propriety of discussions of Professional subjects in newspapers by Medical men; but in a case where a question of life or death may depend upon the delay of a day, exceptions to all rules must be granted. Under any other circumstances we should protest against the propriety of the appearance of some of the following letters in any but scientific journals.

In arranging the extracts we shall give first those relating to the MEDICAL history of the case, and the question whether the deceased might not have died from natural disease; and then those commenting on the CHEMICAL evidence as to the existence of arsenic in the evacuation, the fallacies of Reinsch's test, and the non-existence of arsenic and the presence of antimony in the tissues of the body. It is also necessary to premise that the observations made by Drs. Richardson, Thudichum, and Webb, form part of a memorial addressed by those gentlemen to the Home Secretary.

I.—THE MEDICAL HISTORY.

DR. TYLER SMITH says:—

First, as regards the actual pregnancy of Miss Banks. This was first discovered at the post-mortem examination by Mr. Barwell, but such little consequence was attached to it that the matter was scarcely heard of until the recent trial. It must be remarked that the duration of the pregnancy corresponded as nearly as possible to the length of the illness of the patient. Mrs. Robinson deposed that Miss Banks was taken ill three weeks before she left her house. She went from Mrs. Robinson's to Mrs. Wheatley's on the 3rd of April, and on the 3rd of May—seven weeks from the commencement of her malady—she died. Mr. Barwell gives seven weeks as the limit which the pregnancy might have reached at the time of death.

Was the illness of Miss Banks such as could possibly have been caused by pregnancy?—Obstinate and irrepressible vomiting, with violent purging, were the chief symptoms detailed at the inquest, and at the trial. It is an undoubted fact, recognised by every obstetric authority, that women are often reduced to great peril, and sometimes killed, by the vomiting of pregnancy. Obstinate diarrhœa is also met with as a disorder of pregnancy, either alone or in connection with vomiting. It is in the early part of pregnancy that vomiting is most severe and dangerous, and it often begins at the very commencement of this state. It is most likely to happen in the case of a woman such as Miss Banks is described to have been, pregnant for the first time in mature age, of bilious temperament, and the subject of previous internal disorder. Stress was laid by some of the witnesses on the burning sensations complained of in the stomach and throat. Pregnancy is constantly accompanied by heartburn, and in certain cases there is an enormous amount of acid secretion and eructation from the stomach.

The sickness of pregnancy is commonly most distressing in the morning on first taking food, or on moving the body. This was spoken to as the fact in the case of Miss Banks by one of the witnesses. In the worst cases, the vomiting is wholly intractable. The remedies which arrest ordinary sickness are of no avail. Food and medicine are alike rejected, and the patient dies of starvation. For the last two days of her life Miss Banks was under the care of her sister and a nurse provided by Dr. Julius. It told very forcibly against the prisoner that at this time, although the stomach rejected medicine, it retained food. In two out of four fatal cases from this kind of vomiting in which I have been consulted the patients were able to take food for a short time before death; the sickness ceased when fatal exhaustion had set in. The same is related to have been the case in the history of Charlotte Brontë. Her biographer states that towards the close

"she begged constantly for food, and even for stimulants. She swallowed eagerly now; but it was too late." Her illness is described as having lasted six weeks.

Is it possible that the Physician in attendance upon Miss Bankes made an error of diagnosis in assigning poison as the cause of her illness and death?—It was strongly insisted on as a proof of poisoning, that Dr. Todd, Dr. Julius, and Mr. Bird, should, either individually or concurrently, have formed the opinion that their patient was suffering from slow irritant poisoning. Against this it is only fair to place the fact that they did concurrently overlook the existence of pregnancy, although it was before them, and marked by one of its most common and distinctive symptoms. It cannot but be considered as remarkable that three Medical men should have been in attendance upon a woman forty-two years of age, living for the first time as a married person, who had been suddenly seized with an illness of which vomiting was a prominent symptom, without detecting pregnancy. They appear to have been misled by the information given to them by Smethurst as to the absence of one of the common symptoms of pregnancy, and they made no examination. Smethurst himself appears not to have suspected pregnancy. As regards Dr. Todd, it may be accounted for by the circumstance that, however undisputed his great eminence as a pure Physician may be, he is not accustomed to treat the disorders of pregnancy. However the fact may be, the Medical attendants certainly formed a conclusion while they were without the knowledge of a very important element of the case.

Do the symptoms of a fatal case of vomiting from pregnancy so far resemble poisoning as to be liable to be mistaken for them?—There is no limit to the reflex irritation which the pregnant uterus may excite in various organs of the body, especially the stomach. In my "Manual of Obstetrics," published in 1858, I state that "an almost poisonous influence seems to be exerted by the gravid uterus in some constitutions." Several years ago I knew of a case of this kind in which poison was actually suspected.

Dr. Todd laid considerable emphasis on an extraordinary expression of Miss Bankes's countenance, such as he had never observed in a case of natural disease. Dr. Paul Dubois, the present Physician-Accoucheur to the Empress of the French, who related that he saw twenty cases of death from the vomiting of pregnancy in thirteen years, refers to "a marked change in the features," as one of the signs indicating a state of danger, and calling for the induction of abortion to save the patient's life.

DRS. RICHARDSON, THUDICHUM, AND WEBB.

After quoting cases corroborating the views advanced in Dr. Tyler Smith's letter, these gentlemen say:—

"On June 3rd, 1857, the prize for the best essay on this subject was awarded to Dr. David Hutchinson, of Mooresville; and the essay, at the request of the Rhode Island Medical Society, was published in 1857. In this essay Dr. Hutchinson has brought together a weight of information which explains all that may appear anomalous in the case of Miss Bankes, and in cases similar.

"We will transcribe Dr. Hutchinson word for word in his recapitulation of the nature, symptoms, and course of the disease:—

"**DIAGNOSIS.**—This affection may be distinguished from other forms of stomatitis by a burning sensation in the mouth, as if it had been scalded, which is greatly aggravated by hot drinks; attended at first with redness of the mouth and tongue, and followed by aphthæ and ulcerations of the buccal cavity. In some cases there is a diffused redness of the mucous membrane of the mouth instead of ulcers. These symptoms are generally attended, and often preceded by a burning sensation in the stomach, pyrosis, indigestion, and occasionally vomiting. The bowels are either constipated, or obstinate diarrhœa attends. The disease is confined to pregnancy and lactation, although it has been said to attack those that were not in those conditions, and even the male subject; yet we have seen it in no other conditions but those of pregnancy and lactation, and would infer that it had been confounded with some other form of stomatitis. In addition to the foregoing symptoms, its migratory character is highly diagnostic, and also the frequent and painful micturition which frequently precedes the affection of the mouth or diarrhœa.

"**PROGNOSIS.**—Always uncertain as to the final result.

Although there is generally not any immediate indications of danger, yet such is the liability of the mucous structures to inflammation that the condition of the patient may always be considered precarious while the disease persists. When the disease extends to the larynx, trachea, or bronchial tubes, the patient may either die from the intensity of the inflammation, or at a remote period consumption ensues, usually in one or two years. But the patient is more apt to perish from the intestinal affection; when the diarrhœa persists, in despite of judicious treatment, and the discharges are mucus, tinged with blood, indicating ulceration of the bowels, a fatal result may be anticipated."

In an essay entitled "*Vomissements incoercibles pendant la Grossesse*," M. Cartaya has collected fifty-eight cases of uncontrollable vomiting, twenty-four of which proved fatal to the mother, without producing the abortion of the embryo, despite the most varied and energetic treatment. Professor Stoltz, of Vienna, records not less than eleven cases in which the vomiting of pregnancy terminated in death. Nay, so important has this disease been considered in Medical science, that in 1855 a discussion took place in the Academy of Medicine in Paris, as to the propriety of producing abortion in extreme cases of this nature. If, then, to a condition in itself so dangerous, dysentery be superadded, what surprise is to be expressed at a fatal termination? For it is not only that the vomiting itself exhausts, but that it insures starvation; and that by such starvation the dysenteric disease and the destruction of the coats of the intestinal canal are of necessity favoured.

DR. HERBERT BARKER, OF BEDFORD, records the following case singularly analogous to that of Miss Bankes:—

"Mrs. C., aged 42, the wife of a respectable tradesman in this town, became for the first time pregnant in the end of May, 1857. Immediately after conception she was attacked with the vomiting of pregnancy, which continued with unceasing violence until the time I was first consulted, August 15. She had already received various medicines, such as magnesia, carbonate of soda, and Gregory's powder, but without any effect in arresting the vomiting; and she was considerably reduced, partly from the vomiting, and partly from the inability to retain food. A few days before I was consulted the symptoms were aggravated by the superposition of diarrhœa.

"When I saw her I found the following symptoms: she was suffering from extreme thirst, emaciation and exhaustion, and was confined entirely to bed. The vomiting was intolerable. Whatever was taken was returned, sometimes with bilious fluid and mucus, while in the intervals between food there was a persistent loathing and nausea. The vomited matter gave an acid reaction with litmus. She was purged seven or eight times each day, and the matter ejected by the bowels contained no true feculent matter, but mucus, tinged with blood. Accompanying this there was painful tenesmus. The tongue was creamy in the centre, with red tip and edge; the pulse small, quick, and feeble. The whole symptoms, in fine, indicated an acute dysenteric attack, coupled with the vomiting.

"Detecting the pregnancy, and believing that all the phenomena of disease had their origin in sympathetic irritation commencing in the uterus, I prescribed, first, an effervescent mixture, with an excess of alkali, to each dose of which were added three minims of the diluted hydrocyanic acid of the London Pharmacopœia. This gave no relief. After trying this for a day or so, I prescribed a mixture containing, in each dose, the trisnitrate of bismuth, five grains; diluted hydrocyanic acid, three minims; and five minims of the solution of hydrochlorate of morphia, in water. This mixture, continued every four hours for four days, produced no alleviation in the symptoms. I therefore moved a point in practice, paying more decided attention to the dysenteric symptoms, which had become more urgent. By this time not only was mucus, tinged with blood, still excreted by the bowel, but false membrane, resembling diphtheritic exudation, began to be thrown off in considerable quantity. I now prescribed chalk mixture, with ten minim doses of laudanum, three times daily, and a pill night and morning containing two grains and a-half each of Dover's powder and hydrargyrum cum cretâ. This treatment, with the addition of catechu to the mixture, suppositories of

opium, and enemata of starch and laudanum, was continued until the last day of August, but with no relief. The case now became of serious import, owing to the extreme exhaustion necessarily induced. On the last day of August my anxiety was somewhat relieved by the discovery of symptoms of threatened abortion. These symptoms continued, and, fortunately for the life of the mother, a fetus was thrown off on September 1st. Immediately afterwards the more urgent symptoms, namely, the vomiting and dysentery, began to subside, but were replaced for a few days by retention of urine, for the relief of which the catheter had to be used at stated intervals."

ANONYMOUS.

A Correspondent, who sends his name and address to the *Morning Star*, says:—

"In the spring of this year I resided with my family, at Richmond, very near to the house lately occupied by Dr Smethurst. During the time, my daughter was seized with dysentery and sickness, accompanied by extreme prostration. The symptoms were, as far as I can judge, similar to those of Miss Bankes. Her life was, at one period, despaired of.

"Dr. Hassall attended her, and attributed the attack to the effect of the impure gases that escaped in the house from imperfect drainage, and also, possibly, to the bad state of the water. In this insidious way poison was conveyed to the system.

"So important a case did Dr. Hassall regard it, that he requested me to memorialise the town authorities on the subject, which I did. I removed from the house as speedily as the state of my daughter's health would permit."

Dr. Hassall's testimony as to the existence of such an epidemic at Richmond during the illness of Miss Bankes might be of the greatest importance.

DRS. RICHARDSON, THUDICHUM, AND WEBB.

Was the death of Isabella Bankes compatible with the hypothesis of poisoning by arsenic, antimony, or by both?—To this question we conceive a negative answer is justified by facts—symptomatic, pathological, and chemical. *

It is justified by the symptoms. While it is true that the symptoms of vomiting and purging, and other symptoms observed in the case of Isabella Bankes, have been also observed in cases of arsenical poisoning, there has been no case known, and we challenge the production of the history of a case, in which death resulting from the administration of arsenic in small and long-continued doses has not been preceded by a train of other symptoms, specific in their nature, but absent altogether in the case before us.

The symptoms thus absent are, moreover, not obscure in character; they are symptoms which must have attracted notice; they are symptoms as peculiar to the effects of arsenic as a poison, as the scarlet rash to scarlet fever, or the pustular eruption to small-pox. These absent symptoms are:—

1. Irritation and inflammation of the conjunctivæ of the eyes. (This symptom is common to men and animals, and is considered by Mr. Hunt, a Practitioner who has had very large experience in the administration of arsenic, as the true criterion of the system being under the influence of that metal.)
2. Irritation, inflammation, and ulceration of the lining membrane of the nostrils.
3. Irritation, inflammation, and ulceration, or excoriation of the lining membrane of the lips.
4. Excoriation of the anus, and of the vagina in the female.
5. Hacking cough and spitting of blood.
6. A cutaneous eruption, called "eczema arsenicale."
7. A train of peculiar affections of the nervous system, viz., tremors of the limbs, tingling of the fingers and toes, spasms of the muscles of the limbs, convulsions, paralysis, delirium, and coma.

We would not state dogmatically that in a case of slow arsenical poisoning every one of these symptoms must needs be present; but we assert that the entire absence of the whole series is decisive against the hypothesis of slow arsenical poisoning.

THE POST-MORTEM.

But the evidence against the arsenic hypothesis is doubly strengthened by the post-mortem inquiry. We have shown

before, that the morbid appearances are acknowledged to have been those of dysentery. We say, as an addendum to this admission, that they were not those of arsenic. In slow arsenical poisoning, the stomach is the organ which first receives and suffers from the local irritant, when it is administered by the mouth; and we can add, that this irritant, however introduced into the system, exerts its primary and specific action on the lining membrane of the stomach. After the stomach, the small intestines are the parts influenced. The large intestines, with the exception of the rectum, either escape, or are the seat of lesions secondary to those of the stomach. In the case of Isabella Bankes these conditions were reversed. The stomach and small intestines, post-mortem results excluded, were scarcely affected; they were firm, and absolutely free from ulceration and abrasion. The large intestines were virtually and admittedly the seats of the disease. Now, as we have no right to assume that the known pathology of arsenical poisoning was in this single example utterly subverted, we are compelled to arrive at the only possible conclusion, viz., that the pathology of the case of Miss Bankes was not that of chronic arsenical poisoning, and in this conclusion we are supported by the records of all experiments and experience.

Again, to take up the hypothesis of antimonial poisoning,—while it is admitted that the symptoms of vomiting and purging are such as characterise poisoning by tartarised antimony, we are convinced that various symptoms specific of this poisoning were absent in the case of Isabella Bankes. These absent specific symptoms are—

1. Sweating and cold clammy condition of skin without febrile excitement.
2. A pustular eruption. The characteristic tartar-emetic pustule occurring on the skin, on the palate, or on both; or a red rash much resembling the eruption of scarlet fever.
3. Symptoms of congestion of the lungs.
4. Watery choleraic discharges from the bowels, alternating with or succeeded by constipation.

The hypothesis of poisoning by a combination of the two poisons, arsenic and antimony, is equally at variance with facts, symptomatic and pathological. It is true, that in regard to this mode of poisoning, we have only the results of experiment on the inferior animals to guide us. But we can speak authoritatively from such results. In four animals, dogs, treated by us with arsenic and antimony, we observed, symptoms and appearances after death, strictly in accordance with the specific effects of both poisons. All the animals had irritation of the conjunctivæ and nervous tremors; one had tartar-emetic pustules of the mouth, while ulceration of the stomach and congestion of the lungs were leading post-mortem results.

II.—THE CHEMICAL EVIDENCE.

MR. HERAPATH.

I find in the *Times* of May 21, that Dr. Taylor deposed that "bottle No. 21 he found half full of a clear fluid," that he tried Reinsch's process on it, and "found that there were seven grains of chlorate of potash in an ounce of it, which was 1 6-10 per cent., and that there was a grain of arsenic to every ounce;" he further said that it was of the sort we call white arsenic, and that he had previously tried the tests (materials) and found them pure. Here was evidence of the most positive and distinct kind; not only was arsenic found, but the weight estimated, and its nature (white) ascertained. Upon the trial this was stated to be a mistake; that, although the former evidence was given so boldly and so particularly, it was now found that there was no arsenic in it, but that the arsenic found was in the copper, although the copper had, with the other materials, been previously proved to be pure. The witness went on to say that he had at first operated upon an evacuation, and found arsenic in that, but admitted that he had used the same copper for many years, consequently all proof of the presence of the poison either in the body, or in the evacuation, or in the bottle in the possession of the prisoner, was destroyed by the witness himself, and the jury must rest upon the symptoms and physiological appearances in the opinions of the Medical witnesses called, which are about equal for and against the prisoner. But the mischief does not end here, for if the same impure copper "has been used for twenty years," and evidence given upon it, what shall be said of the justice of the convictions and executions

which have taken place during those years upon Dr. Taylor's evidence?

But was the arsenic said to be found in bottle No. 21 really in the copper used to prove its presence? Could the copper wire gauze dissolved by seven grains of chlorate of potash and its associated hydrochloric acid deposit one grain of arsenic? In the face of all England I say it could not; the hundredth part of a grain of arsenic in that quantity of copper would render it so brittle that it could not be drawn into wire at all, much less into fine wire fit for gauze; the fact is, the whole set of operations were a bungle. Reinsch's process is not applicable where nitrates or chlorates are present.

Next, where his admirable process is resorted to, the mere discoloration of the copper does not prove the presence of arsenic; it only proves that one or more of the inferior metals—arsenic, antimony, tin, lead, bismuth, mercury, &c., are present.

To individualise arsenic among these, four more experiments are necessary. The first is sublimation in a stream of air, when crystalline arsenious acid is produced from the black deposit. Next, that sublimate must be dissolved in water, and tested by three methods: first, ammonia, sulphate of copper; next, ammonia, nitrate of silver; and, thirdly, sulphuretted hydrogen.

Thus, one separation and four proofs produce a body of evidence which it is impossible to gainsay, and these five proofs should be brought into court so as to be examined by those who are competent to recognise them; and I here warn juries that no evidence short of tangible production of the poison and its tests, ought to be for one moment attended to; any deviation from this rule will convert a convicted criminal into a martyr, and deprive trial by jury of the infallibility which it ought to possess; and, lest it might be imagined that it may not be possible to secure enough of the poison to make the five proofs, I should say that the one-thousandth part of a grain is quite sufficient.

MR. RODGERS.

In the recent trial of Dr. Smethurst errors of the greatest importance, and more or less apparent, have gained publicity. In consequence of the weight attached to them by the Lord Chief Baron Pollock in his charge to the jury their correction has become a matter of the utmost necessity.

The most prominent of these errors is the statement given in evidence by Professor Brande, that it is a new fact in chemistry that chlorate of potash (meaning the mixture of hydrochloric acid and chlorate of potash) dissolves copper, and that he should have committed the same blunder as that acknowledged by Professor Taylor. This statement is untrue, and requires correction, the more so as the learned Judge urged this as a strong point on the consideration of the jury; and, again, I emphatically repeat not true, for this mixture has long been known as one of the most powerful solvents, actually used to dissolve and separate copper from its ores, and, so far from presenting obstacles to the detection of arsenic, it affords the means, as was discovered by Drs. Fresenius and Von Babo, of separating arsenic from the blood organs and tissues of the body (*vide Lancet*, vol. i. for the year 1844). Indeed, by a slight modification of their process, I have been enabled in a great number of instances to separate the minutest trace of any metallic poisons in numerous cases which I have been called upon by coroners to investigate.

It should also be known that the presence of chlorate of potash interferes in no way with the action of the tests by which the presence of arsenic in an aqueous solution can be most incontestably proved, and that Reinsch's process in itself is not a test, but is only a method by which arsenic can be separated from matters that do not admit of the conclusive application of the proper tests.

Again, Reinsch's process was represented as the most efficient known; but it is ill adapted where the blood organs and tissues form the subjects of analysis, and is totally inapplicable in all cases unless copper perfectly free from arsenic be employed. I draw particular attention to the importance of using perfectly pure copper, as Dr. Taylor in evidence emphatically expressed his determination to use the same copper gauze (which he has himself found to contain arsenic) in any future analysis he may be called upon to make where chlorate of potash is not present.

With the conviction of Dr. Smethurst a new era in our jurisprudence commences; for it is certain that cases similar to that of Isabella Bankes have occurred in the practice of our most celebrated accoucheurs from natural causes; that while the morbid appearances observed in her case were not such as our present experience warrants us to expect in a case of antimonial or arsenical poisoning, they were such as might arise from natural disease; that in no other case has poison been found in the blood without, on examination, its presence being most satisfactorily demonstrated also in the various organs and tissues,—a fact on which my own long experience in toxicological analysis entitles me to express a most positive opinion.

I will observe, in conclusion, that in all cases of medico-legal inquiry, it would be well to adopt the course pursued by Mr. Wakley, *i.e.*, that the analyst employed should take only half the suspected matter, the remainder being sealed up by him and left in safe custody, in case his results should be called in question.

DR. SHEARMAN, OF SHEFFIELD.

1. Reinsch's test for arsenic, when properly employed, is not disturbed by the admixture of any quantity of chlorate of potash. The most simple and accurate mode of investigation into the supposed presence of metallic poisons in organic mixtures is by treating such with hydrochloric acid, subsequent boiling, and free addition of the chlorate of potash in fine powder. During the decomposition which occurs free chlorine is developed and a rapid oxydation of the organic matter takes place, rendering the subsequent examination simple and free from complex substances. This is the plan adopted by the most accomplished analytical chemists systematically; yet in Dr. Taylor's case, from ignorance of the presence of the chlorate, it led to most serious and dangerous erroneous opinion.

2. Reinsch's test, tried in the presence of free chlorate of potash, dissolves the copper as stated by Dr. Taylor; but this is evident immediately to the eye by the green tint produced, and Dr. Taylor should at once have observed the change. If he had then removed the chlorate he would not have obtained a deposit of arsenic from his own copper gauze.

3. Other substances besides chlorate potash produce the same solution of the copper; and some of these substances are the peculiar salts which occur in large quantities in the evacuations of dysentery, the intestinal disease following typhoid fever and severe diarrhoea.

4. Lehmann, Güterbock, and Schmidt, men of the very highest position as physiological chemists, have pointed out in the evacuations of the above diseases the presence of large quantities of the phosphate of ammonia and magnesia and chloride of sodium; and Dr. Taylor can easily prove, as other chemists have done, that these salts, when present in evacuations or other mixed fluids, will cause the solution of the copper gauze; if that gauze contain arsenic, the arsenic will be freed and deposited on other portions of the gauze.

5. Miss Bankes had most of the symptoms of dysentery; her evacuations were such as to dissolve the copper from the presence of the above salts. Dr. Taylor's gauze, as he acknowledges, contained arsenic; which would be deposited again on the copper, and account for the presence of that poison in the evacuation.

6. This was the only arsenic found. In other words, it was only found where the chemical constitution of the matter examined was such as to lead to the same error as that Dr. Taylor acknowledges to have committed in the case where he subsequently found the chlorate of potash.

7. There is no more ground for the suspicion of arsenic in the evacuation than there was in the substance contained in the bottle, pronounced by correct analysis, free from the arsenic it was first stated to contain.

8. No sound chemist, in an ordinary case of suspected impurity, would certify to the presence of arsenic by such an analysis. He would at once, so soon as the copper dissolved, find out the error of the analysis; and, in the case in question, have totally removed the dissolving substance before giving an opinion as to the presence of that metal.

9. Should copper gauze, containing arsenic, be used in Reinsch's test, the evacuation in any case of dysentery, severe diarrhoea, and that resulting from typhoid disease of the bowels would give as distinct evidence of the presence of arsenic, as that in Miss Bankes's case. Under such

circumstances death, from natural diarrhoea, might at any time involve a suspected person in a crime of which he was totally innocent.

I know no other conclusion to be derived from the chemical investigation in this case than that there is not a trace of evidence of the existence of arsenic but in the copper gauze.

DRS. RICHARDSON, THUDICHUM, AND WEBB.

There is not a case on record of slow arsenical poisoning, in which, on subjecting the tissues to modern chemical research, arsenic has not been indubitably discovered. We have searched, in pursuing our inquiries, all the scientific records of poisoning since the year 1808, the year when Rose first introduced an analytical proceeding for the discovery of arsenic in tissues and organic mixtures; and the fact above stated is the result of that labour. We further state, from repeated experiments on animals, that it is impossible for arsenic to be administered in small and long-continued doses, in any way or combination whatever so as to destroy life and yet leave behind in the dead body no evidence of its presence.

An attempt has been made to show that as in one out of three evacuations passed by Isabella Bankes arsenic in minute proportion was found, together with copper; therefore arsenic must have been feloniously administered.

We will first consider the question of the safety of this analysis. In regard to this statement of the finding of arsenic, the broad fact stands out that the analysis was made by means of a specimen of copper which admittedly contained arsenic. Considering the many existent chances by which the copper in such analysis may be oxidised and dissolved, we consider it a sacred duty incumbent on us to entirely repudiate an analysis made with such impure materials. The analysis may be true, it may be false,—it may be a mixture of truth and falsity. Certainly, an attempt was made to show that copper in some experiments did not dissolve in the presence of organic substances. But to prove this, months, we may say years of research, must be employed, and the effects of every organic substance, healthy and diseased, must be tested. So that in our present state of knowledge the inference is natural that the copper yielded to the evacuation the arsenic found, as it was proved to have yielded arsenic to a solution of chlorate of potash in which (as it was confessed) no arsenic originally existed.

But even if we were to admit that the arsenic was not introduced by the arsenical copper, but was deposited on it from the evacuation, there is afforded a direct interpretation of the circumstance, in the consideration of the nature and the impurities of medicinal substances taken by the deceased.

Three remedies were administered to Isabella Bankes, two of which were proved to have contained arsenic. These were sulphate of copper and grey powder. Trisnitrate of bismuth, also administered to the deceased, is a drug, in every specimen of which, as we can ascertain, arsenic is present. Trisnitrate of bismuth, obtained from the same wholesale house as that from which Isabella Bankes was supplied, we have proved to contain arsenic by abundant experiment. It was stated by a witness for the prosecution that a portion of Dr. Julius's bismuth, supplied by that house, did not contain arsenic. We affirm, from experiment, that the analytical proceeding adopted by that witness for the detection of the arsenic in the bismuth, was entirely unadapted for the purpose of such detection. Had the simple and strictly chemical method of separating the two metals, bismuth and arsenic, in the form of sulphides, been adopted, the arsenic would have been infallibly found. Here, then, are sources for the introduction of arsenic into the body of Isabella Bankes. But now the question of quantity is brought into conflict. The prosecution affirmed that the quantity discovered in the evacuation was more than could be accounted for, by the supposition that the metal found its way through the medium of medicines containing it as an impurity.

Upon this we feel constrained to examine the mode by which the quantity of arsenic assumed to have been in the evacuation was determined. A minute ring of microscopical crystals of arsenious acid was obtained from the evacuation. The ring was never weighed, but a comparison by sight was instituted with another portion of arsenic first weighed and then sublimed into a tube. The hundredth of a grain was hereupon guessed at as the weight of poison derived from two grachms of the evacuation.

We need not stay to expose the fatal fallacy of this mode of determination of quantity. Comparison of weight by mere sight, can give but an imperfect knowledge of relative weight, even when large objects are in question. What, then, of comparisons made on a number of microscopical crystalline particles undefinable by the unaided eye, and amounting altogether to the assumed weight of 1-100th of a grain? We are content, whatever our wonder at the assumption, to say that the quantity of arsenic in the evacuation was entirely undetermined, and that the accidental introduction of arsenic into the body by the means we have pointed out is amply sufficient to account for the undetermined trace of the poison said to have been discovered in the evacuation.

We have put the correctness of this view to the test of experiment. Having obtained a specimen of urine from a patient who had for six days been taking bismuth in small doses, we found arsenic in the urine, and thus proved the fact that bismuth administered by the mouth will yield arsenic to the excretions.

In the same terms as those in which we have spoken of arsenic and its detection, we would speak of antimony.

There is no known instance of slow poisoning by this agent, either in man or a lower animal, in which, after death from the agent, the poison has not been found in the liver. In the evidence given for the prosecution, amidst discrepancy and hesitation, it was stated that traces and indications, and less than traces and indications, of antimony were found in the blood, in portions of the intestines, and in one kidney, but not elsewhere.

To us it is incomprehensible that antimony should be found in the blood in any case, and not be found in the liver; the organ which, according to all experimental history, is the chief depôt of the poison. This contradiction of all foregone experiments throws a doubt over the validity of the peculiar experiments by which antimony was presumed to have been determined in the tissues of Isabella Bankes; a doubt strengthened by the circumstances that the mode by which the antimony was sought for is unknown to all but the experimenters. But granting, once more, that undefined and undefinable traces and indications of antimony were derived, the detection is explainable with perfect consistency, irrespective of the hypothesis of felonious administration. Antimony is so slow to leave the body, that it may be detected in animal tissues three months after it has ceased to be administered. It exists, moreover, as we have proved, as an impurity of grey powder, of which the deceased took thirty-two grains. It exists in bismuth, another substance administered medicinally to the deceased. With these facts before us, which admit of direct demonstration, we offer no exaggeration in saying that an hypothesis of felonious administration based on the finding of traces and indications of antimony in the tissues of Isabella Bankes, falls to the ground, bereft alike of ingenuity and probability.

HUNTERIAN SOCIETY.—The meetings of this Society will recommence on Wednesday, October 5th. The chair is taken at eight o'clock. Officers for the Session 1859-60. *President*—D. Henry Walne, Esq. *Vice-Presidents*—Herbert Davies, M.D.; John Jackson, Esq.; Thomas Brown, Esq.; W. W. Gull, M.D. *Treasurer*—William Cooke, M.D. *For the Oration of 1860*—Stephen Ward, M.D. *Librarian*—Nathaniel Ward, Esq. *Secretaries*—S. W. Devenish, M.B.; H. I. Fotherby, M.B. *Council*—W. J. Little, M.D.; W. M. Cooke, M.D.; G. C. Dale, Esq.; J. S. Ramskill, M.D.; Miles Beale, Esq.; W. S. Saunders, M.D.; T. M. Daldy, M.D.; Robert Barnes, M.D.; Robert Fowler, M.D.; W. B. Langmore, Esq.; Joseph Reid, M.D.; Buxton Shillitoe, Esq.

RHEUMATISMAL PAINS IN SCARLATINA.—M. Trousseau has recently asserted that rheumatismal pains are present in one-third of all cases of scarlatina. The reason persons do not observe the fact is that they don't look for it. During seven years at the Hôtel-Dieu, although he had noted every case of scarlatina, he had himself never observed the fact; the patients do not complain of pain in the joints; the pains must be sought for. It is just the same with the orchitis of variola, as pointed out by M. Bérard. Sydenham, who had seen so many cases of small-pox, had never observed it, nor had he. M. Trousseau, however, in speaking of these pains, wishes it to be understood that he is referring only to cases of scarlatina in the adult.

CURIOSITIES OF MEDICAL EVIDENCE.

At the recent Lunacy Commission at Exeter, of which we gave a short account in our last number, there were some amusing discussions between the Medical witnesses and the counsel. We append a few examples. Dr. Bucknill was the first subject. It appears that he had tested the "calculating powers" of the old lady whose sanity was the subject of the inquiry. When he asked her how much she would have to pay per week for her lodgings, at £100 per year, she could not answer the question. Mr. Collier: Will you be kind enough, Dr. Bucknill, to say how much that is a week? Witness (hesitating): I cannot tell in a moment (laughter). Mr. Collier: Come, £100 a-year, how much is that per week? Don't be nervous; take time (laughter). Witness: I decline to tell you. Mr. Collier: You won't, or you cannot? Witness: I decline to tell. Mr. Collier: Can you tell without taking out your pencil and going through the figures? Witness: No (laughter). The Commissioner: I don't think the learned counsel can (laughter). Mr. Collier (reading from his brief): It is just thirty-eight shillings, and five-twelfths of a penny (laughter). Then Dr. Tuke had deposed that the general answers of the lady "evinced a want of power to comprehend a subject." He asked: Who is the present reigning sovereign? She did not seem to understand it. She did not answer. He said: Don't hurry yourself; who is the head of the constitution, who administers the law? He put it many ways, but she seemed not able to understand. The young lady interposed the question: Who is the present Queen? Miss Ewings said immediately "Queen Victoria." The Commissioner: She beat you in the question, doctor; yours was rather philosophical (laughter). Witness avoided leading questions (laughter). This was "nuts" for the cross-examination, especially when as an additional proof of insanity, Dr. Tuke said the old lady seemed "constantly puzzled." Then the lawyers had the best of it. The examination was continued thus:—I asked her who was the head of the constitution; who administered the law. I wanted to give her a question that should make her think, but not to puzzle her. Q. So it was to make her think that you asked her who administers the laws. Now, Dr. Tuke, who does administer the laws? (Laughter.) Witness: I decline to answer. Mr. Collier: Why it is your own question. Witness: Yes, I put it to the lady gently and kindly (laughter). Mr. Collier: Oh very well, I will put it to you gently and kindly: Dr. Tuke, who administers the laws of this country? (Laughter.) Witness: If I were to answer at once—Mr. Collier: Oh, take time; consider of it. Witness: I should say the King or Queen. I see the dilemma, but when I put the question to Miss Ewings, I was "talking down" to her. Mr. Collier: Now, on consideration, should you say the Queen, or the Lord Chief Justice of England? Witness: On consideration I think it might be the Lord Chief Justice. The Commissioner to the witness: Who is the Chief Magistrate? Is it not the Sovereign? Witness: That was my impression; I wanted to ascertain if the lady understood a proposition. If I had asked, Who is the King or Queen reigning? I have no doubt she would have answered rightly. But my question may have puzzled her, although I put it in every possible way not to puzzle her. I could get no answer. Q. How could you expect one? A. She might have said "What do you mean?" "Put it clearer," and that would have been an answer. She gave no answer, and that is one ground on which I formed my opinion, although it is a weak one. I think it possible that the failure in getting an answer may have been the fault of my question. Mr. Collier seems to have done the low comedy of the case. The intellectual sparring was left to Mr. Karlake, whose cross-examination of Dr. Paterson is a masterpiece of forensic subtlety. Q. What is the difference between a delusion and an unfounded belief? A. (hesitatingly.) It is very difficult to say. Q. There certainly must be words in the coinage of the English language to express it. What is the difference between an unfounded belief and an unfounded impression? A. Many sensible people may labour under a delusion. Q. Supposing that a man was to tell you to-morrow that I am Oliver Cromwell, and nothing on the earth would prevent my belief in it, is that the effect of a delusion or not? A. Certainly. Q. Supposing that you had been with me an hour, and I told

you that a man had come into the room, and had attempted to strangle me, and that nothing of the sort had occurred, is that a delusion? A. Yes, I suppose it is. Q. It would not be an exaggerated belief? A. No; if there had been no foundation for it. Q. You would admit that was, strictly speaking, a delusion? A. Yes. Q. Are you aware that by the law of the land a person believing in delusions is a madman? A. Of course it is entirely a matter of meaning of words. Q. No, no, it is not. Are you aware that a person having a persistent delusion of a thing that does not exist, is insane and incapable of making a will? A. Yes; that is an insane delusion. Q. I am talking of a delusion as the persistent belief in a thing which does not exist, nor never did exist, would you call that an insane delusion? A. It is an insane delusion. Q. Then putting the adjective insane, is that the mere putting a vituperative expression to a delusion? A. I think almost all people may persuade themselves in the existence of something that does not exist, nor never did exist, and not be mad. Q. I grant you that, but is it not an insane delusion? A. Of course. Q. You recognise a distinction between a mistaken fact and a delusion? A. Yes; because a person may believe he is attacked by three persons when it is only one. Q. But supposing you had ascertained from Miss Ewings, or she had told you that at Warrington, before she went to the asylum, a woman with one arm had thrown her down in her lap, and had clasped her round her neck, and you knew that it was not a fact, would not that be a delusion? A. I say that I do not believe that a mistaken belief as to what occurred in paroxysms of mania is a delusion. Q. Do you believe that delusions engendered during delirium or mania are not delusions? A. It is only the memory of a delusion. Q. Is it not a continuing delusion? A. Certainly not. Q. Will you explain the difference between the memory of a delusion, and a delusion? A. One is an impression on the mind, and the other arises from a false conception. Q. Very well; but supposing that a madman had a delusion that he was told by an angel to murder his father, would you believe that to be a past or existing delusion? A. I should say it would be both a past and existing delusion. Q. Will you draw the distinction between the two? A. It is impossible, because a man would not, in the nature of things, be told such a thing by an angel. Q. But suppose that he was told by a gipsy; would that be a delusion? A. No, an erroneous belief. Q. Define the difference between a delusion and an erroneous belief, taking my premises. A. It is a belief arising from a false impression of the mind; a totally unfounded impression of the mind. Q. Is not that a delusion, as I said before? A. I draw a distinction in my own mind as to what, in my own judgment, is an erroneous belief, or an unfounded belief, or a delusion. I should think that which you mentioned about an angel is the memory of a delusion. Q. Give us the definition of a delusion. A. It is difficult to say. Q. Is the present belief in a non-existent thing a delusion? A. Certainly, if you prove to the mind of an individual who holds that belief that the thing never did exist. That is a delusion. Q. I assume that one evidence would be, that the more you attempt to persuade him that it was a delusion, the more he would persist in believing it? A. Certainly. Q. Has it occurred to you in your practice to find that a common symptom of mania is the continuing to believe in an exaggerated thing, as distinguished from delusion? A. Certainly.

A QUESTION IN MEDICAL ETHICS.—A discussion took place a short time since at the New York Academy of Medicine on the question, Whether the Academy should pass an opinion on surgical instruments and apparatus which have been patented? Dr. MacNulty contended that it was contrary to the spirit of the Code of Ethics of the National Medical Association for Physicians to obtain patents, and consequently that they should not act on other people's patents. This sentiment met with much opposition, and the general opinion was, that surgical appliances should come under a different rule from nostrums, being usually invented, at least in part, by mechanics, who could not do without the patent. A resolution by Dr. MacNulty, to the effect that the consideration of no patented article should be entertained by the Academy, was lost; but the vote was afterwards reconsidered, and the resolution laid on the table.

MEDICAL NEWS.

APOTHECARIES' HALL.—Names of gentlemen who passed their examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 25th August:—

BIRD, JOHN DUNHAM, Stretford, Manchester
FALEVASSER, FRANCIS, Sherborne, Dorset
FENNELL, EDWARD HENRY, Ramsgate
HAYES, ROBERT HULME, Longton, Stafford
HERBERT, BENJAMIN HEYWOOD, Francis-street, Edgbaston
HICKS, ROBERT
KIRBY, THOMAS CHARLES, Bodicott, Oxfordshire
KNIGHT, THOMAS, Brill, Bucks
LLEWELLYN, DAVID HERBERT, Malmesbury, Wilts
MILLARD, WILLIAM JOSEPH, Whitchurch, Monmouthshire
PLATT, THOMAS, Oldham, Lancashire
VAN, ARTHUR FERDINAND, Northfleet, Kent

The following gentlemen also on the same day passed their First Examination:—

CALDWELL, WILLIAM T. D., Harleyford-place, Kennington
LANGTON, JOHN, Denmark-hill, Surrey

DEATHS.

ADAMS.—August 25, at Kingtown, Neason Adams, M.D., in his 84th year.
ATKINSON.—August 3, at Castlebar, John Atkinson, M.D. aged 68.
BENNETT.—Thomas Wainwright Bennett, Assistant-Surgeon in the army, stationed at Gambia.
BOURNES.—July 28, at Belmullet, County Mayo, Matthew Bournes, M.D.
BURNAND.—August 22, near Chichester, William Burnand, many years head of the late firm of Burnand and Newland, of Chichester.
BURNETT.—August 1, at North Shields, William Burnett, aged 41.
CLELAND.—August 18, suddenly, Allen Cleland, L.S.A., of No. 4, Norway-place, Limehouse.
COLSTON.—August 2, at Bishop's Stortford, John Colston, native of Port Glasgow, N.B., aged 52.
FORBES.—August 15, at Kennoway, Fifeshire, George Forbes, M.D. St. Andrew's, and L.R.C.S. Edin. 1806.
FALCON.—August 19, at Weymouth, Robert Falcon, M.D., formerly of Whitehaven, and late of Cheltenham, aged 71.
GARRINGTON.—July 5, at Benares, East Indies, William Archibald Garrington (eldest son of Wm. Hawkins Garrington, of Portsea,) M.R.C.S. and L.S.A.
HAGYARD.—August 13, at Hovingham, Yorkshire, very suddenly, of apoplexy, Robert Hagyard, M.R.C.S. Eng., and L.S.A. 1848, aged 38.
HALL.—August 22, at Old Swan, Liverpool, Richard Hall, aged 54.
JAMES.—August 16, at North-street, Cheltenham, Samuel James, aged 65.
KAYE.—July 16, at the Sanatorium, Bombay, Assistant-Surgeon Kaye, 2nd extra Battalion.
MITCHELL.—August 6, at Nether Inver, Monymusk, Aberdeenshire, Robert Mitchell, M.R.C.S. Eng. 1813, formerly Assistant-Surgeon H.E.I.C. Maritime Service, aged 68.
STEWART.—Recently, David Stewart, Surgeon (7th January, 1853), 92nd Foot.
WHITE.—August 16, at Shanganagh, Ireland, Francis White, F.R.C.S. Ireland, late Inspector-General of Lunatic Asylums in Ireland, etc., etc.

WE are assured that the profits from the Festival, which are to be devoted to the Bradford Infirmary and Hospital, will amount to something like 1000*l*.

THE first drinking-fountain in Marylebone has at length been opened. It is situated near the ancient gate in front of the Infirmary of the Marylebone Workhouse.

THE Duke of Marlborough has paid £135 to the account of the Oxford Radcliffe Infirmary, being balance of moneys received from visitors to Blenheim Palace and gardens during this season.

THE Prince Consort, who is to preside this year at the Annual Meeting of the British Association, to be held at Aberdeen, will deliver the inaugural address on the evening of Wednesday, the 14th of September.

LORD HENRY SEYMOUR, we learn from the *Globe*, has left a rent-roll equal to £36,000 sterling per annum to the Hospitals, and nearly an equal sum to a number of the "*femmes galantes*," of Paris.

THE Library of Humboldt, which had been left to his old valet, has this week been sold to Lord Bloomfield for the sum of about £6,000. It is said to be destined for the British Museum.

M. TARDIEU has been elected by a large majority to the place vacant in the Section of Hygiene at the French Academy. His opponents were MM. Bouchut, Boudin, Becquerel, Duchesne, and Réveil.

DURING the second quarter of 1859, the births, deaths, and marriages in Scotland were, in reference to the estimated population, at the annual rate of one birth in every 27, one death in every 50, and one marriage in 152 persons.

THE will of Colin Campbell, Esq., formerly Physician-General in the Hon. East India Company's Bengal Establishment, has been proved in London by one of the executors. The personality in England is sworn under £12,000.

A MEMORIAL is projected by many of the Army Medical Officers and others, in appreciation of the services of the late Sir James Macgregor, who for so many years presided over the Medical Department of the Army. A subscription has been opened for the purpose.

MORTALITY AMONG EMIGRANTS.—During the last five years the mortality on board emigrant ships which have proceeded to North America has been as follows:—1854, '74 per cent.; 1855, '33 per cent.; 1856, '22 per cent.; 1857, '36 per cent.; and 1858, '19 per cent.

THE Social Science Association has proposed the following special question for its next annual meeting at Bradford, in October:—"How far, and in what way, can the national census of 1861 be made available for procuring information on the moral, material, and social condition of the country?"

A GENTLEMAN living at Bow, in the midst of the smokiest suburb of London, has produced abundant crops of the rarest fruits for many years. He has glass houses erected on the leads of his house; he stretches over the openings made for free circulation of air, woollen netting with $\frac{3}{4}$ -inch meshes to entangle the blacks and keep out slight frosts.

WE some time since referred to the fact of the very defective condition of the Barracks in Trinidad. It now appears, that even up to this time no fit place for soldiers' dwellings has been found. What a satire this on the *system*, which has for years past sacrificed so many valuable lives through inattention to the simplest laws of Hygiene!

THE advent of a new Red-Tapeism is announced with the termination of the Indian war. An "Old Soldier" informs us "That the Commander-in-Chief in India expresses his regret at the 'irregularities' caused by the late active service, and desires commanding officers to immediately order a new supply of shakoes, and all the rest of it."

IT should be recorded, that during the past week 20 persons, "including 14 unhappy children under 5 years of age," died of small-pox in London; 28 persons died by accident or negligence; namely, 12 by mechanical injuries, 4 by burns, 1 by poison, 10 by drowning, and 1 by suffocation; 1 person was murdered, 5 committed suicide, 3 died suddenly without stated cause.

BRITISH MUSEUM.—The experiment of opening this institution in accordance with the Saturday half-holiday movement has been eminently successful, and it is intended by the trustees that the same plan shall be adopted next summer. Since last Wednesday the institution has been entirely closed to the public, but will be reopened on September 7, as usual at this period of the year.

MORTALITY IN THE ARMY.—The Commander-in-Chief has informed the Registrar-General that in 1857, 3220 officers and men died in the army abroad, against 2580 in 1856, 20,315 in 1855 (Russian War), and 7383 in 1854. The annual rate of mortality in Great Britain, including the deaths of soldiers abroad, was (in 1857) 2157 in Great Britain and 2178 in England and Wales, and 2323 in France. The rate was also higher in France in 1855 and 1856.

OPPOLZER relates (in the *Wien Med. Woch.*) a well-marked case of angina pectoris. The man, the subject of the disease, died in a fainting-fit, after suffering repeated attacks. Here again, as in so many cases, the muscular substance of the heart was found far gone in fatty degeneration, the origin of the aorta highly atheromatous, and the calibre of the coronary arteries (particularly the left) very much narrowed through a similar deposit of atheroma. In this case Oppolzer considered that the deposit in the aorta, by compressing the coronary arteries had prevented the due nutrition of the heart's structure.

M. CAGNIARD DE LA TOUR's name is well known to our Profession in connexion with sound and the sense of hearing. He was the author of the instrument called the *Sirène*, by which the number of sonorous vibrations, which constitute a note, is measured. He died suddenly a few weeks ago in Paris. He was born in 1777; in 1794 he entered the Polytechnic School. In 1811 he was attached to the Council of State and Ministry of the Interior. In 1815 he was decorated, obtaining the title of Baron in 1818, and the Cross of St. Michael in 1823, and in 1851 he succeeded Gay Lussac at the Academy of Sciences.

PRIZE QUESTIONS OF THE FISKE FUND FOR 1860.—1. Diphtheritis, its nature and treatment, with an account of the history of its prevalence in different countries. 2. The morbid effects of the retention in the blood of the elements of the urinary secretions. For the best dissertation on either subject a premium of 100 dollars is offered. Essays are to be sent post free to S. A. Arnold, M.D., Secretary of the Trustees of the Fiske Fund, Providence, Rhode Island, before May 1, 1860; and the successful candidates will be announced at the meeting of the Rhode Island Medical School, at Newport, on the second Wednesday in July.

ILLEGITIMATE BIRTHS IN SCOTLAND do not diminish. Of the 28,556 births registered in the second quarter of 1859, 2455, or 8·5 per cent, were illegitimate, a proportion slightly higher than the corresponding quarter of last year. The table showing the proportions of illegitimate births in the different divisions of Scotland continues, as formerly, to exhibit the highest proportions in the north-eastern and southern districts. Banffshire, in the north-east division, still figures at the head of the ignominious list, showing 17 per cent.; the southern county of Selkirk follows at 16·3 per cent.; and the north-eastern county of Aberdeen succeeds at 14·8 per cent. The smallest proportions are in the extreme north and in the western counties. The proportion as between town and country is respectively 8·4 and 8·7.

NATIONAL ASSOCIATION FOR THE PROMOTION OF SOCIAL SCIENCE.—The third annual meeting of the Association is announced to take place at Bradford on the 10th of October, and two following days. A programme of the proceedings has been issued, from which it appears that the meeting will be presided over by the Earl of Shaftesbury; that Sir W. Page Wood will be President over the department of Jurisprudence, Mr. C. B. Adderley over that of Education, Mr. Monckton Milnes over that of Punishment and Reformation, and the Right Hon. W. Cowper over Public Health; and lastly, that Sir James Kay Shuttleworth will be President over the department of Social Economy. Lord Brougham has accepted the office of permanent President of the Council, and will in that capacity deliver an address at the Bradford meeting.

PINEL ON MAGNETISM.—"I must say one word to you about magnetism, although it be on its decline,—especially among people of sense,—since the Report of the Academy. Replies have been made, and pamphlets have been published, but unfortunately for their authors they are not read. The Government has long been desirous that the public should be enlightened concerning this species of mania. I fancy that it has just received its last stroke through being put on the stage. A piece has lately appeared at the '*Italiens*,' entitled

the '*Modern Doctors*,' in which Mesmer and Delon—the two heads of the sect—are introduced in a most charmingly pleasant and gay manner; every one bursts with laughter, and if you were there you would find in it an excellent remedy for your melancholy. Nothing has so astonished the *Mesmerians* as this last hit. Still, however, there is amongst women an extreme zeal for the new medicine. They find it very *gentil*, there being certain necessary touchings, and a certain development of trickery on the part of the magnetiser. I, myself, wishing to become instructed in the secret, attended M. Delon for two months. This has led to some pleasant adventures; and when reason sleeps, I find no little pleasure in prescribing for ladies the charming manœuvres of magnetism."

A MEDICO-MILITARY FUNERAL.—The funeral of Assist.-Surgeon Arthur Henry Taylor, attached to the Medical Staff of the Royal Horse Artillery, has just been performed at Woolwich with the full military honours due to his rank. The death of the deceased occurred at Chelsea, whence his body had been removed to Woolwich for sepulture, in fulfilment of his own request. The distinguished career of the deceased during his period of service in the Russian campaign was on various occasions notified, in his despatches to Government, by Major-General Sir Richard Dacres, at present commanding the garrison of Woolwich. On Wednesday a general notification in garrison orders was issued for the arrangement of the funeral, at which the whole of the officers were invited to attend. At eleven a.m. the coffin was brought forth by six gunners of the Royal Artillery, heroes of the Crimean war, who had solicited that duty as a doleful tribute to him to whom, under Providence, they impute their recovery from severe and dangerous wounds incurred at Inkermann. The remains of the deceased were conveyed to the place of interment on the usual military bier, a gun-carriage, covered with a union-jack. On a small black cushion, placed on the bed of the coffin, were laid the decorations won by the deceased, together with his busbie and sword; and at his head and feet a garland and wreath of *immortelles*. The whole of the Artillery and Engineer troops not otherwise engaged were in attendance. The full band of the Royal Artillery headed the procession, and the two bands of the Royal Marines and the Royal Horse Artillery followed the bier. Major-General Sir Richard Dacres, K.C.B., accompanied by a numerous body of his own officers and those of other corps in garrison, attended as a mark of especial respect to the deceased.

CRIMINAL ABORTION IN THE UNITED STATES.—To so great a pitch has this practice arrived in the States, that the American Medical Association has found it necessary to take it up, and in 1857 appointed a committee, with Dr. Storer, of Boston, as its reporter. At the meeting at Louisville, in May of the present year, an elaborate report has been presented, which we shall notice on its publication. In the meantime, the following resolutions of the committee have been unanimously adopted:—"Resolved, 1. That while Physicians have long been united in condemning the act of procuring abortion at every period of gestation, except as necessary for preserving the life of either mother or child, it has become the duty of this Association, in view of the prevalence and increasing frequency of this crime, publicly to enter an earnest and solemn protest against such unwarrantable destruction of human life. 2. That in pursuance of the grand and noble calling that we profess—the saving of human life—and of the sacred responsibilities thereby devolving on us, the Association presents this subject to the several Legislative Assemblies of the Union, with the prayer, that the laws by which the crime of attempted abortion is sought to be controlled may be revised, and that such other action may be taken in the premises as they in their wisdom may deem necessary. 3. That the Association request the zealous co-operation of the various State Medical Societies in pressing the subject upon the Legislatures of their respective States." The Editor of the *Boston Medical Journal* recently notices the conviction of the "notorious Dr. David Brown" for this crime. He also stigmatises the inconsistency of the verdict of manslaughter, the crime being murder or nothing. This has arisen from the disinclination of juries to convict for a crime attended with the penalties of murder, the culprit indeed, generally, escaping altogether. "Under the present state of feeling on the subject, it strikes us that it would be almost worth while to mitigate the severity of the penalty, rather than allow so many criminals to escape 'scot free.'"

VITAL STATISTICS OF LONDON.

Week ending Saturday, August 27, 1859.

BIRTHS.

Births of Boys, 840; Girls, 870; Total, 1710.
Average of 10 corresponding weeks, 1849-58, 1523.2.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	629	588	1217
Average of the ten years 1849-58	634.4	642.3	1276.7
Average corrected to increased population	1120
Deaths of people above 90
Deaths in 15 General Hospitals	34	18	52

DEATHS IN SUB-DISTRICTS FROM EPIDEMICS.

	Popula- tion, 1851.	Small pox.	Mea- sles.	Scar- latina.	Diph- theria	Whoop- ing- Cough.	Dia- rrhœa.	Ty- phus.

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29.861 in.
Mean temperature	66.6
Highest point of thermometer	81.0
Lowest point of thermometer	54.6
Mean dew-point temperature	56.2
General direction of wind	N.W.S.W.
Whole amount of rain in the week	0.25
Amount of horizontal movement of air in the week	380 miles.

TO CORRESPONDENTS.

Mr. Humphreys.—Cases received.

Alpha.—The General Council is not likely to meet again until next year.
We have published the minutes of their last meeting.

M.R.C.S. and L.S.A. of Fifteen Years' standing does not seem to have observed the last advertisement of the Edinburgh College. An examination is now necessary to obtain the licence.

Dr. Cregeen.—The rule only to admit one address on the Register is clearly a bad one, and there can be no justification for registering two addresses for one Practitioner, and refusing to do so for others.

Mr. Hazard.—The Act was not meant to be retrospective, but it is quite clear that no one who is not a Member of a College of Surgeons can legally call himself Surgeon. The duties named by our correspondent may be undertaken by any registered Practitioner.

FOREIGN GRADUATES.

We are requested to state that a Petition to the Privy Council from unregistered Foreign Graduates may be had of Dr. Thorn, 87, Harrow-road, W.

REGISTER! REGISTER! REGISTER!

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—You would do a service by calling the attention of qualified but unregistered men, who are very numerous, to the serious inconvenience they may occasion others by their not being able to perform any legal act,—especially that all their lunacy, pension, invaliding, and other Medical certificates are waste-paper; and they leave to unqualified persons the argument—"Well, if I am not registered, no more is Dr. A. or Mr. B., yet no one denies that they are entitled to practise." Under the Thirty-seventh Section a curious question as to the continued validity of lunacy certificates signed by unregistered men (even though signed before the Act was passed) might be raised!

DIPHTHERIA.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Should you think the following notes on the pathology of Diphtheria of any use, they are at your service; they are founded on the personal observation of about sixty or seventy cases.

Diphtheria has a period of incubation, attended by premonitory symptoms, both subjective and objective; and if it falls under proper treatment during this period, it seems never to become severe, much less fatal. Some of the objective symptoms are pathognomonic. These pathognomonic prodromata are a punctiform and stellate redness on the soft palate, alone or combined with minute vesicles, like military vesicles, and in some cases erythematous (?) patches on the hard palate. (These are oblong patches of about half-an-inch square of mucous membrane, raised about a tenth to the twentieth of an inch above the surrounding tissue, of a lake purple colour and middle tint,—briefly, congested patches.)

When exudation takes place, the colour of the membranes surrounding the exudation (so far from having the dusky colour usually described, and which belongs properly to the middle and last stage), is of a florid or vermilion red. There being very often a vermilion line surrounding the exudation, at about a line distant from it; the line being of about the same width; and sometimes giving off a bright arterial vessel, to lose itself apparently in the exudation. In one case there was a dark red soft-looking patch, on the right posterior wall of the pharynx, and a lighter red streak on each anterior arch of the palate.

Having thrown out these suggestive hints to show that there is need for further independent investigation, I leave the subject in the hands of those who have better opportunities for such observations.

I am, &c. Thos. F. O'Donovan, M.R.C.S.L.
University College, London, August 23, 1859.

GREY POWDER, ITS USE AND ABUSE.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—The question now propounded in your columns as to the true value of "grey powder," (hyd. c. crota) is of the utmost importance to the health of the public, as well as to the scientific reputation of the Medical profession.

The opinion on this subject put forward in a letter which appeared in the *Times* of the 20th inst., signed "James Bird," is likely to mislead the public mind, and to produce mischief, by increasing a confidence—already too much abused—as to the efficacy of this dangerous drug.

The writer of the aforesaid letter states that "Grey powder is a valuable remedy in extensive use." I presume he means in ordinary use.

It is unfortunately too commonly resorted to, especially in the case of young children, being prescribed for the smallest ailment, the most simple derangement of the stomach and bowels; indeed, it is very common for mothers, through their blind faith in this drug, to apply to chemists for "a grey powder for the baby," and administer it to the infant, without the advice or sanction of a Medical man, taking all responsibility upon themselves as to the child's need, and the effects of this potent medicine upon the little delicate constitution. Although grey powder may not contain any proportion of an active poison, such as arsenic, it undoubtedly has the effect of a slow poison, therefore the sooner the General Practitioner and the public are enlightened on the subject the better. I believe all thoughtful liberal-minded members of the Profession will agree with me in pronouncing grey powder a very dangerous medicine to administer repeatedly, and one which it is very ill-judged to give at all in ordinary ailments; nothing but an obstinate condition of the liver, or other extreme case, demanding a bold treatment, could justify its employment and I will venture to state my belief that the habitual use of this drug produces more serious and permanent disorders than any which it is employed and presumed to cure.

I hope the challenge offered by your correspondent "J. P." in the *Medical Times and Gazette* of to-day will induce Dr. Thudichum to give your readers the benefit of his experience and views, which, as those of a Doctor of Medicine, a Lecturer on Practical and Experimental Chemistry, and a pupil of Professor Liebig, must possess some considerable weight and value.

I do not hesitate to say that, if hyd. c. crota (mercury with chalk) were to be struck off the list of *Materia Medica* to-morrow, the public—the infant portion more particularly—would benefit, not suffer, by its disuse.

I am, &c. MATER.
London, August 27.

COMMUNICATIONS have been received from:—

Dr. SIMPSON; Dr. MOREHEAD; Dr. HILLIER; Dr. MACPHERSON, Calcutta; Mr. PHELAN; Mr. CROSKERY, Jamaica; Mr. GILLARD; Mr. WHITFIELD; Mr. ELLIOT; Mr. PEET; Mr. HUGHES; Mr. DILK; Mr. DENT; Dr. HATCHAM; Dr. THORN; Mr. DUFEN; Mr. PITTARD; Mr. CHEVASSÉ; Mr. RIVERS; Mr. CARVER.

APPOINTMENTS FOR THE WEEK.

September 3. *Saturday (this day).*

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

5. *Monday.*

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

6. *Tuesday.*

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

7. *Wednesday.*

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopædic Hospital, 2 p.m.; Middlesex, 1½ p.m.

8. *Thursday.*

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m. London, 1½ p.m.; Great Northern, 2½ p.m.

9. *Friday.*

Operations, Westminster Ophthalmic, 1½ p.m.

EXPECTED OPERATIONS.

King's College Hospital.—The following operations will be performed this day (Saturday):—

By Mr. Lee—For Radical Cure of Hernia (new operation); Contraction after Burn; Varicose Veins (two cases); Strabismus.

On Monday the 5th.—By Mr. Partridge—For Club Foot.

Grosvenor Place School of Medicine,

No. 1, GROSVENOR PLACE (Adjoining St. George's Hospital).
WINTER SESSION, 1859-60.
LECTURES.

The INTRODUCTORY LECTURE will be delivered on MONDAY, OCTOBER 3rd, at Three o'clock, p.m., by Dr. COCKLE.

General Anatomy and Physiology—Dr. Richardson.
Descriptive and Surgical Anatomy—Dr. Halford and Mr. Lawson.
Practical Anatomy—Mr. Pittard.
Chemistry—Dr. Thudichum.

Principles and Practice of Medicine—Drs. Cockle and Leared.
Principles and Practice of Surgery—Mr. Spencer Wells & Mr. Adams.

FEES.—General Fee to all the Lectures required by the Universities of London and St. Andrews, the Royal College of Surgeons of England, and the Society of Apothecaries, 35 Guineas.

Special arrangements may be made for any one of the Examining Boards.

Prizes and Honorary Certificates will be awarded for general proficiency at the termination of the Session.

The Microscope is used to illustrate the Lectures and Demonstrations.

The Dissecting Room and Museum of Anatomy are open to the Students during day-light, where their Studies are superintended by the Lecturers on Anatomy and Mr. Pittard.

The Lecturer on Chemistry has a Private Laboratory, where Students are instructed in Analytical and Physiological Chemistry.

Instruction in Pathological Anatomy is given by the Lecturer on Physiology.

Further information may be obtained at the School, 1, Grosvenor-place; or Dr. Richardson, 12, Hinde-street, Manchester-square, W.; or at the Residences of the different Lecturers.

London Hospital Medical and Surgical

COLLEGE, Mile-end.—1859-60.—The next WINTER SESSION will commence on MONDAY, October 3, 1859, when the INTRODUCTORY LECTURE will be delivered by Mr. CRITCHETT, at Three p.m.

Nicholas Parker, M.D.—Medicine.

Thos. Blizard Curling, F.R.S., George Critchett—Surgery.

John Adams—Descriptive and Surgical Anatomy.

Andrew Clark, M.D.—Physiology and General and Morbid Anatomy.
Practical Histology.

John Sharman, John Couper—Practical Anatomy.

Henry Lethaby, M.B. Lond.—Chemistry; Practical Chemistry.

H. J. Barrett—Anatomy and Pathology of the Teeth and Dental Surgery.
F. H. Ramsbotham, M.D.—Midwifery and Diseases of Women and Children.

F. H. Ramsbotham, M.D., Henry Lethaby, M.B. Lond.—Forensic Medicine.

Herbert Davies, M.D.—Materia Medica and General Therapeutics.

George Critchett—Ophthalmic Surgery.

Robert Bentley, F.L.S.—Botany.

J. Langdon H. Down, M.B.—Comparative Anatomy.

General Fee for attendance on the Medical and Surgical Practice, qualifying for the examinations at the London University, Royal College of Surgeons, and Apothecaries' Hall, and for perpetual attendance on all the Lectures, 84 guineas, payable in two instalments of 42 guineas each, at the commencement of the two first Winter Sessions of attendance.

Perpetual Fee to the Lectures alone, £50.

Students can make special entries to Lectures or Hospital Practice.

Further particulars and prospectuses can be had on application to Dr. Parker, Hon. Secretary, 22, Finsbury-square, E.C.; or at the College.

Westminster Hospital School of

MEDICINE.—The INTRODUCTORY ADDRESS of the Session 1859-60 will be delivered by Dr. RUSSELL REYNOLDS, on MONDAY, the 3rd of October, at 8 p.m.; and after the Address a CONVERSATION will be held, and the PRIZES of the past Session distributed.

The Westminster Hospital was Instituted A.D. 1719, and Incorporated by Act of Parliament A.D. 1836. It contains 175 Beds, and affords relief to about 20,000 Out-patients annually.

HOSPITAL PRACTICE.

Physicians—Dr. Basham, Dr. Fincham, Dr. Radcliffe.

Assistant-Physicians—Dr. Marcet, Dr. Reynolds.

Surgeons—Mr. Barnard Holt, Mr. Brooke, Mr. Holthouse.

Assistant-Surgeons—Mr. Hillman, Mr. Power.

Surgeon-Dentist—Mr. Clendon.

LECTURES.

Descriptive and Surgical Anatomy—Mr. Holthouse.

Practical Anatomy—Mr. Heath and Mr. Gray.

Dental Surgery—Mr. Clendon.

Chemistry—Dr. Marcet, F.R.S.

Surgery—Mr. Barnard Holt, and Mr. Brooke, M.A. F.R.S.

Physiology and Physiological Anatomy—Mr. Power.

Medicine—Dr. Basham.

Botany—Mr. Syme, F.L.S.

Comparative Anatomy and Zoology—Mr. Power.

Natural Philosophy—Mr. Brooke, M.A. F.R.S.

Materia Medica and Therapeutics—Dr. Radcliffe.

Forensic Medicine—Dr. Fincham and Dr. Reynolds.

Practical Chemistry—Dr. Marcet, F.R.S.

Midwifery—Dr. Frederic Bird.

Clinical Lectures.—In addition to the instruction given by all the Medical Officers during their visits, Courses of Lectures on Clinical Medicine and Surgery, in accordance with the new regulations of the Examining Boards, will be delivered during the Winter and Summer Terms by the Physicians and Surgeons.

Clinical Assistants, Physicians' Clerks, and Surgeons' Dressers, are selected from the most qualified Students, without additional Fee.

The Entire Course of Study (including Hospital Practice and Lectures) required by the College of Surgeons and the Society of Apothecaries, may be attended on payment of Seventy Guineas.

Further information may be obtained on application to

F. J. WILSON, Secretary to the Hospital.

King's College, London.—Medical

DEPARTMENT.—THE WINTER SESSION, 1859-60, will commence on SATURDAY, OCTOBER 1, 1859, on which day all Students are expected to attend the Introductory Lecture, at Two o'clock.

The following Courses of Lectures will be given:—

Anatomy—Professor Richard Partridge, F.R.S.

Physiology; General and Morbid Anatomy—Professor Lionel S. Beale, M.B.

Chemistry—Professor W. A. Miller, M.D. F.R.S.

Principles and Practice of Medicine—Professor George Budd, M.D.

Principles and Practice of Surgery—Professor William Fergusson, F.R.S.

KING'S COLLEGE HOSPITAL.

Physicians...	George Budd, M.D. F.R.S.	} With care of In-Patients.
	R. B. Todd, M.D. F.R.S.	
	George Johnson, M.D.	
	W. A. Guy, M.B. F.R.S.	
	Lionel S. Beale, M.B. F.R.S.	} With care of Out-Patients.

Physician for Diseases of Women and Children and Physican-Accoucheur—

Arthur Farre, M.D. F.R.S.

Assistant-Physicians—Charles Murchison, M.D.; Conway Evans, M.B.

W. Fergusson, F.R.S.

Richard Partridge, F.R.S.

William Bowman, F.R.S.

Henry Lee, F.R.C.S. ... With care of Out-Patients.

Assistant-Surgeons—John Wood, F.R.C.S.; John W. Hulke, F.R.C.S.

Surgeon-Dentist—S. Cartwright, jun.

The Hospital is visited daily. Clinical Lectures are given every week, both by the Physicians and by the Surgeons. The Physicians' Assistants and Clinical Clerks, the House-Surgeons and dressers, are selected by examination from the Students of the Hospital.

SCHOLARSHIPS.—New Students will have the privilege exclusively of contending, in October, 1859, for five Warneford Scholarships—viz., two of £25 per annum, for three years, and three of £25 per annum, for two years. The Examination will commence on the 29th of September, in Divinity, Classics (subjects the same as for the Matriculation Examination this year at the University of London), Mathematics, History, and the Modern Languages.

One Scholarship of £40, tenable for two years; one of £30, for one year; and three of £20 each, for one year, will be filled up in April next, the subjects of the Examination being exclusively Medical.

Further particulars may be obtained from J. Harley, Esq., Sub-Dean of the Department; and a detailed Prospectus will be forwarded by application to J. W. Cunningham, Esq., Secretary.

R. W. JELF, D.D., Principal.

St. Thomas's Medical Session.—

A GENERAL INTRODUCTORY ADDRESS will be delivered by Dr. RT. DUNDAS THOMSON, on SATURDAY, 1st October, 1859, at Three o'clock p.m., after which the Distribution of Prizes, &c. will take place.

Gentlemen have the option of paying £40 for the first year, a similar sum for the second, and £10 for each succeeding year; or £90 at one payment, as perpetual.

PRIZES AND APPOINTMENTS FOR 1859-60.

Voluntary Matriculation Examinations are held early in October, and Prizes are given in each of the three following divisions:—

1st. In Mathematics, Classics, and Ancient History. The President's Prize of 20 Guineas.

2nd. In Physics and Natural History. A College Prize of £20.

3rd. In Modern Languages and Modern History. A College Prize of £20.

To the three most distinguished Pupils for General Proficiency in each year, the following Prizes are awarded:—

FIRST YEAR'S STUDENTS.

1st. The Treasurer's Prize of 30 Guineas. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

SECOND YEAR'S STUDENTS.

1st. A College Prize of £30. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

The Dressers and the Clinical Clerks are awarded to merit, after examination.

THIRD YEAR'S STUDENTS.

1st. A College Prize of £30. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

Clinical Assistants, a Prize of £10, and £5 to the two most meritorious.

Mr. Geo. Vaughan's Cheselden Medal. The Treasurer's Gold Medal.

Mr. Newman Smith's Prize of £5 for the best Essay on "Neuralgia."

The two House-Surgeons, the Resident Accoucheurs, and the Dressers, are periodically selected, and are provided with rooms and commons in the Hospital, free of expense.

A Hospital Registrar, at an annual salary of £80.

Students of each year are classed according to their respective total merits in the examinations, and all of the First Class receive Certificates of Honour.

MEDICAL OFFICERS.—Dr. Roots, Consulting Physician; Mr. Green, Consulting Surgeon; Dr. Barker, Dr. J. Risdon Bennett, Dr. Gooden, Mr. South, Mr. Mackmurdo, Mr. Solly, Mr. Le Gros Clark, Mr. Simon, Dr. Peacock, Dr. Bristowe, Dr. Waller, Mr. Whitfield.

Clinical Instruction is given at stated times by the Medical and Surgical Officers; and a systematic Course of Medical Clinical Lectures, by Dr. Barker. Ophthalmic Surgery, Mr. Mackmurdo; Midwifery, Dr. Waller and Mr. H. Gervis; Dental Surgery, Mr. Patient; Medical Tutor, E. Clapton, M.D.

Lecturers on Clinical Medicine—Dr. Barker. Medicine—Dr. J. Risdon Bennett. Surgery—Mr. South. Physiology—Mr. Grainger and Dr. Brinton. Descriptive and Surgical Anatomy—Mr. Le Gros Clark and Mr. S. Jones. Chemistry and Practical Chemistry—Dr. Rt. Dundas Thomson. Midwifery—Dr. Waller. Practical Midwifery—Mr. H. Gervis. General Pathology—Mr. Simon. Botany—Dr. Eristowe. Comparative Anatomy—Mr. W. M. Ord. Materia Medica—Dr. Peacock. Forensic Medicine—Dr. Brinton. Public Health—Dr. Headlam Greenhow. Anatomical Demonstrations—Mr. Rainey and Mr. W. M. Ord. Demonstrations Morbid Anatomy—Dr. Bristowe and Mr. S. Jones. Microscopical Anatomy—Mr. Rainey.

Students can reside with some of the Officers close to the Hospital.

The Patients are admitted daily at Half-past Nine a.m., and the Out-Patients seen at the same time.

To enter, or to obtain Prospectuses and further information, apply to Mr. Whitfield, Medical Secretary, resident at the Hospital.

St. George's Hospital Medical School.

SESSION 1859-60.—The WINTER COURSE of INSTRUCTION will commence on SATURDAY, October 1st, with an INTRODUCTORY ADDRESS by Mr. H. C. JOHNSON, at 2 p.m., at the Hospital.

Physicians—Dr. Page, Dr. Bence Jones, F.R.S., Dr. Pitman, and Dr. Fuller.
Assistant-Physicians—Dr. Barclay and Dr. John W. Ogle.
Obstetric Physician—Dr. Robert Lee, F.R.S.
Surgeons—Mr. Caesar Hawkins, F.R.S., Mr. Cutler, Mr. Tatum, and Mr. H. C. Johnson.

Assistant-Surgeons—Mr. Prescott Hewett and Mr. George D. Pollock.
Dentist—Mr. Vasey.

Lecturers—Medicine—Dr. Pitman.
" Surgery—Mr. Tatum.
" Anatomy—Mr. Pollock and Mr. Gray.
" Physiology—Mr. A. Johnson.
" Chymistry—Dr. H. M. Noad.

The Hospital contains 350 beds.

Clinical Lectures are given by the Physicians and Surgeons of the Hospital during the Winter and Summer Sessions, and Clinical Instruction is given in the Wards by the Physicians and Surgeons, and on the Diseases peculiar to Women by the Obstetric Physician.

A Maternity Department, for the delivery of married lying-in women at their own homes, is established at the Hospital, under the superintendence of the Obstetric Physician.

The Surgeons' Perpetual Pupils are eligible to be Assistant House-Surgeon for Six Months, and House-Surgeon for Twelve Months (without additional Fee), when properly qualified for the office. Pupils of the Hospital are eligible to the office of Obstetric-Assistant, when duly qualified, at a salary of £100 per annum.

Pupils entering to St. George's Hospital Medical School are free to all Lectures and Hospital Practice necessary for the Examination of the College of Surgeons and Society of Apothecaries, by the payment of FORTY GUINEAS the first year, FORTY GUINEAS the second year, and TWELVE GUINEAS the third year. But Pupils have the option of entering to the different courses of Lectures and Hospital Practice by separate payments.

EXHIBITIONS AND PRIZES.

"The William Brown Exhibition," of Forty Pounds per Annum, tenable for Three Years, may be held by any Pupil, perpetual to the Medical or Surgical Practice, who has commenced his third, but not completed his fourth Winter Session. Pupils entering to the Hospital Medical School in the Session 1859-60 will be entitled to compete for this Exhibition.

A Prize of Twenty Guineas, for general proficiency in Medical Studies, will be offered to Students who enter to the Hospital Medical School for the Session 1859-60. The Examination will take place in July.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Guy's Hospital.—The Medical Session

commences in OCTOBER. The INTRODUCTORY ADDRESS will be given by Dr. HABERSHON on SATURDAY, October 1, at Two o'clock.

MEDICAL OFFICERS.

Physicians—Thomas Addison, M.D.; G. H. Barlow, M.D.; Owen Rees, M.D., F.R.S.; W. W. Gull, M.D.
Assistant-Physicians—S. O. Habershon, M.D.; S. Wilks, M.D.; F. W. Pavy, M.D.
Surgeons—Edward Cook, Esq.; John Hilton, Esq., F.R.S.; John Birkett, Esq.
Assistant-Surgeons—A. Poland, Esq.; C. Forster, Esq.; T. Bryant, Esq.
Obstetric Physician—Henry Oldham, M.D.
Assistant Obstetric Physician—Braxton Hicks, M.D.
Surgeon-Dentists—T. Bell, Esq., F.R.S.; J. Salter, Esq.
Surgeon of the Eye Infirmary—John F. France, Esq.

LECTURERS.—WINTER SESSION.

Medicine—Owen Rees, M.D., F.R.S.; W. W. Gull, M.D.
Surgery—John Hilton, Esq., F.R.S.; John Birkett, Esq.
Anatomy—Alfred Poland, Esq.; Cooper Forster, Esq.
Physiology—F. W. Pavy, M.D.
Chemistry—Alfred Taylor, M.D., F.R.S.
Demonstrations on Anatomy—Mr. Durham and Mr. Moxon.
Experimental Philosophy—Mr. Durham.

Gentlemen desirous of becoming Students must give satisfactory testimony as to their education and conduct. They are required to pay £40 for the first year, £40 for the second year, and £10 for every succeeding year of attendance, or £100 in one payment entitles a Student to a Perpetual Ticket.

Dressers, Clinical Clerks, Ward Clerks, Obstetric Residents, and Dressers in the Eye Wards, are selected according to merit from those Students who have attended a second year. A Resident House-Surgeon is appointed every six months from those Students who have obtained the College Diploma.

Six Scholarships, varying in value from £25 to £40 each, will be awarded at the close of each Summer Session for general proficiency.

Two Gold Medals will be given by the Treasurer—one for Medicine and one for Surgery.

A Voluntary Examination will take place at entrance, in Elementary Classics, and Mathematics. The three first candidates will receive respectively £25, £20, £15.

Mr. Stocker, Apothecary to Guy's Hospital, will enter Students, and give any further information required.

Guy's Hospital, July, 1859.

Evening Demonstrations of Anatomy.

—Mr. CHRISTOPHER HEATH, Demonstrator of Anatomy at the Westminster Hospital, will resume his Evening Course of DEMONSTRATIONS and EXAMINATIONS upon the DISSECTED SUBJECT on Wednesday, the 5th of October. The Demonstrations take place on Monday, Wednesday, and Friday evenings, during the Winter Session, from Seven to Nine o'clock, at the Westminster Hospital. Entrance Fee (perpetual) Five Guineas.

University College, London.—Faculty

OF MEDICINE.—The SESSION 1859-60 will open on MONDAY the 3rd October. At 3 o'clock, p.m. a Meeting will be held for the Presentation to Students of the Faculty, of the Medals and Certificates of Honour awarded at the Class Examinations for the Winter and Summer Terms of the last Session. At 8 o'clock p.m. the Professors of the Faculty will receive the Students and their friends at a Conversazione, in the General Library and New Museum of the College. Gentlemen who may be disposed to favour the Professors with their company, are requested, if they have not received invitations, to leave their names and addresses in the office of the College, under cover to the Dean, in order that cards may be sent to them.

The Lectures to the Classes of the Winter Term will commence as follows:—

On TUESDAY, October 4.

Anatomy—Professor Ellis, at 9 o'clock, a.m.
Anatomy and Physiology—Professor Sharpey, M.D., at 10 a.m.
Chemistry—Professor Williamson, at 11 a.m.
Comparative Anatomy—Professor Grant, M.D., at 3 p.m.
Surgery—Professor Erichsen, at 4 p.m.
The Principles and Practice of Medicine—Prof. Walshe, M.D., at 5 p.m.

On MONDAY, October 17.

Practical Physiology and Histology—Dr. Harley, F.C.S., at 4 p.m.
In January—Dental Surgery—Mr. G. A. Ibbetson, at 6 p.m.
Hospital Practice daily throughout the year with Clinical Lectures by the Physicians and Surgeons, also Lectures on Ophthalmic cases.
Prospectuses may be obtained at the Office of the College.

A. W. WILLIAMSON, Dean of the Faculty.
CHAS. C. ATKINSON, Secretary to the Council.

September 20, 1859.

The Middlesex Hospital, Session

1859-60.—The Session opens on MONDAY, October 3rd, with an Introductory Address by Mr. HENRY, at Eight o'clock, p.m.

The Hospital, from recent enlargements, contains upwards of 300 beds, of which 185 are for Surgical and 120 for Medical cases. The Cancer Establishment receives 33 patients. Wards are specially appropriated to cases of Uterine Disease and of Syphilis. 2109 in-patients were admitted during the past year; the number of out-patients during the same period amounted to 16,469.

MEDICAL OFFICERS.—Dr. Stewart, Dr. Goodfellow, Dr. H. Thompson, Dr. Frere, Dr. F. Weber, Dr. Charles Coote, Mr. Shaw, Mr. De Morgan, Mr. Moore, Mr. Henry, Mr. Nunn, Mr. Flower.

Post-mortem Examinations are conducted by Dr. Coote.

LECTURERS.—Clinical Medicine: the Physicians to the Hospital.—Theory and Practice of Medicine: Dr. Stewart and Dr. Goodfellow.—Clinical Surgery: the Surgeons to the Hospital.—Surgery: Mr. Shaw.—Physiology: Mr. De Morgan.—Anatomy: Mr. Moore.—Practical Anatomy: Mr. Nunn and Mr. Flower.—Pathological Anatomy: Mr. Sibley.—Chemistry: Mr. Taylor and Mr. Heisch.—Midwifery: Dr. Frere.—Materia Medica: Dr. H. Thompson.—Medical Jurisprudence: Mr. Henry and Dr. Coote.—Practical Chemistry: Mr. Taylor and Mr. Heisch.—Botany: Mr. Bentley.—Histology: Dr. W. Woodham Webb.—Comparative Anatomy: Mr. Flower.

General Fee for attendance on the Hospital Practice and Lectures required by the College of Surgeons and Apothecaries' Company, £81. This sum may be paid by instalments of £35 at the beginning of the first session, £35 at the beginning of the second session, and £11 at the beginning of the third session. For every additional session, £10.

This fee admits the Students to the Practical Chemistry course, and to all other Lectures delivered in the College except Comparative Anatomy.

All general Students are required to perform the duties of Clinical Clerks and of Dressers during each winter and summer session, except the first winter session.

RESIDENT CLINICAL ASSISTANTSHIPS.

For the encouragement of Clinical Study, and for the promotion of Clinical Instruction in the Hospital, the Governors have instituted Three Clinical Assistantships, to be awarded on competition to Students who have completed their education in the School. It will be the duty of the Clinical Assistants to observe and record the cases in the Hospital, and generally in the absence of the Medical Officers, to carry out the treatment directed by them. They will reside and board in the Hospital for one year free of expense.

Two House Surgeons are elected by competition from among the Students who have completed their curriculum, and reside and board in the Hospital free of expense. Fee, Twenty Guineas.

Prizes and Certificates are also awarded to the Students who have most distinguished themselves, at written periodical Class Examinations, in all the subjects of study embraced in the Session.

The Governor's Prize of Twenty Guineas will be awarded to the Student who, having distinguished himself generally by conduct and acquirements in the College, shall present the best joint Clinical Reports in Medicine and Surgery.

Parents and Guardians who propose sending Pupils to the Hospital may communicate with the Dean, or with Mr. De Morgan, Treasurer, to the College at the Hospital, daily from One to Three o'clock. Information may also be obtained on application to any of the Lecturers, or to Dr. Corfe, the Resident Medical Officer.

All students on entering will be required to sign an undertaking to conform to the laws relating to the discipline of the Hospital and College.

T. W. NUNN, Dean.

Anderson's University, Glasgow.—

The MEDICAL SESSION begins on TUESDAY, NOVEMBER 1st.

Anatomy and Practical Anatomy, by Drs. M. S. and George Buchanan.
Chemistry and Practical Chemistry, by Dr. Penny.
Materia Medica, by Dr. Morton.
Institutes of Medicine, by Dr. E. Watson.
Surgery, by Dr. Hunter.
Midwifery, by Dr. Paterson.
Practice of Medicine, by Dr. Anderson.
Military Surgery, by Dr. M. Leod.

In SUMMER—Botany, by Dr. Bell; Medical Jurisprudence, by Dr. Cowan.
Fee for each Class, £2 2s. The Fees for all the Classes required for Diploma amount to £30. A Syllabus of the Lectures and particulars may be obtained from

ANDREW ANDERSON, M.D., Secretary.

St. Bartholomew's Hospital and

MEDICAL COLLEGE.—The WINTER SESSION will commence on OCTOBER 3rd, with an INTRODUCTORY ADDRESS by Mr. HOLDEN, at Seven o'clock p.m.

LECTURES.

Medicine—Dr. Burrows and Dr. Baly.
Surgery—Mr. Lawrence.
Descriptive Anatomy—Mr. Skey and Mr. Holden.
Physiology and General Anatomy—Mr. Savory.
Chemistry—Dr. Frankland.
Superintendence of Dissections—Mr. Callender and Mr. Smith.

SUMMER SESSION, 1860, Commencing May 1.

Materia Medica—Dr. F. Farre.
Botany—Dr. Kirkles.
Forensic Medicine—Dr. Black.
Midwifery, &c.—Dr. West.
Comparative Anatomy—Mr. M'Whinnie.
Practical Chemistry—Dr. Frankland.

HOSPITAL PRACTICE.—The Hospital contains 650 Beds, and relief is afforded to more than 90,000 Patients annually. The In-patients are visited daily by the Physicians and Surgeons, and Clinical Lectures are delivered—On the Medical Cases, by Dr. Burrows and Dr. Farre; on the Surgical Cases, by Mr. Lawrence, Mr. Stanley, Mr. Lloyd, and Mr. Skey. The Out-patients are attended daily by the Assistant-Physicians and Assistant-Surgeons.

COLLEGIATE ESTABLISHMENT.—Students can reside within the Hospital Walls, subject to the rules of the collegiate system, established under the direction of the Treasurer and a Committee of Governors of the Hospital. Some of the Teachers and other Gentlemen connected with the Hospital also receive Students to reside with them.

SCHOLARSHIPS, PRIZES, &c.—At the end of the Winter Session, examination will be held for two Scholarships of the value of £45, for the year. The Examination for Prizes and Certificates of Merit will take place at the end of the Winter and Summer Sessions.

Further information may be obtained from Mr. Paget, Mr. Holden, or any of the Medical or Surgical Officers or Lecturers; or at the Anatomical Museum or Library.

Sydenham College Medical School,

SUMMER-LANE, BIRMINGHAM (opposite the General Hospital).—The SESSION 1859-60 will commence on TUESDAY, the 4th of October next, with an INTRODUCTORY ADDRESS by W. C. ORFORD, Esq., at Three o'clock in the afternoon.

Anatomy and Physiology—John White Keyworth, M.D.

Pathology—James Russell, M.D. L.R.C.P.L., Physician to the General Hospital.

Practical Anatomy and Demonstration—Messrs. George Elkington, Frowd Jones, and D. Johnson.

Principles and Practice of Medicine—Bell Fletcher, M.D. F.R.C.P.L., Physician to the General Hospital.

Principles and Practice of Surgery—Alfred Baker, F.R.C.S., Surgeon to the General Hospital.

Surgical Pathology—Oliver Pemberton, M.R.C.S., Surgeon to the General Hospital.

Chemistry—Francis Wrightson, Ph.D.

SUMMER SESSION.

Midwifery and the Diseases of Women and Children—Francis Elkington, M.D., Consulting Accoucheur to the Lying-in Hospital; and V. W. Blake, F.R.C.S., Medical Officer to the Lying-in Hospital.

Therapeutics—J. Russell, M.D. L.R.C.P.L.

Materia Medica and Pharmacy—J. Bassett, M.R.C.S.E.

Practical Chemistry and Toxicology—Alfred Hill, M.D. F.C.S.

Botany—Frederick Westcott, Assoc. L.S.

Forensic Medicine—W. C. Orford, Medical Officer to the Lying-in Hospital; and G. Vernon Blunt, M.D.

This College was established for the purpose of affording a complete Medical Education. It is presided over by a Council composed of more than fifty of the most eminent Medical Practitioners of the midland counties. It is situated opposite to the General Hospital, and the hours of Lectures are so arranged as not to interfere with attendance upon Hospital Practice. Attendance upon the Lectures will qualify for examination at all the Royal Colleges, the Army, Navy, and India Boards. Clinical Courses will be given by those Lecturers who are attached to Public Institutions in the town. The Laboratory is fitted up with every convenience, so as to enable Students to obtain a practical knowledge of Chemistry. Care will be taken to instruct the Students in Practical Midwifery, and, under suitable regulations, they will be allowed to avail themselves of the Museum of the Lying-in Hospital. Prizes will be awarded in each Class, and one will be given by the Council for general proficiency.

Further particulars may be obtained on application to the Principal, Dr. Bell Fletcher, Waterloo-street; to the Treasurer, Dr. Russell, Newhall-street, who is authorised to receive Students; or to the Secretaries, Mr. F. Jones, 42, Newhall-street, and Mr. Bassett, 1, St. Paul's-square, Birmingham.

Sydenham College, Summer-lane,

BIRMINGHAM.—MEDICAL TUTOR.—The Committee of Sydenham College are desirous of appointing a MEDICAL TUTOR, to superintend the Education of the Students. Salary, £100 per annum.

Further particulars may be learned from the Principal, Dr. Bell Fletcher, 7, Waterloo-street, Birmingham, to whom applications must be addressed, not later than 1st September.

Pepsine.—M. Boudault begs to state

that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr. PETER SQUIRE, her Majesty's Chemist, 277, Oxford-street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on "Pepsine," with Remarks by English Physicians. Edited by W. S. SQUIRE, Ph. D., published by J. Churchill, London, may be also had of the Author, 277, Oxford-street, price Sixpence.

St. Mary's Hospital Medical School.—

The WINTER SESSION will commence on MONDAY, October 3rd, at Eight o'clock p.m., with an INTRODUCTORY ADDRESS by Mr. URE, after which a CONVERSAZIONE will be held in the Museum.

It is a distinctive characteristic of St. Mary's Hospital that the following Medical Appointments are annually conferred upon the Pupils free of every expense. The advantages of FIVE OF THESE APPOINTMENTS far exceed in money value as many SCHOLARSHIPS of Fifty Pounds each. There are four Resident Medical Officers who board (free of all expense) in the Hospital, three of whom are appointed for twelve months, and one (the Obstetric Officer) who is appointed for six months; four Non-Resident Medical Officers; a Medical and a Surgical Registrar; all of whom are appointed by the Weekly Board of Governors on the recommendation of the Medical Committee. Clinical Clerks and Dressers are selected from the best qualified Students. All the above offices are awarded after competition among the qualified Perpetual Pupils of the Hospital.

Physicians—Drs. Alderson, Chambers, Sibson, H. Jones, Sieveking, and Markham. Surgeons—Messrs. Coulson, Lane, Ure, Spencer Smith, Walton, and J. Lane. Physician-Accoucheur—Dr. Tyler Smith. Ophthalmic Surgeon—Mr. White Cooper. Aural Surgeon—Mr. Toynbee. Surgeon-Dentist—Mr. Sercombe.

Further information may be obtained on application to the Dean of the School, who will also furnish the names of Gentlemen in practice in the vicinity of the Hospital willing to receive Pupils to reside with them.

SPENCER SMITH, Dean of the School.

St. Mary's Hospital, August, 1859.

Mental Disorders.—Wye House,

BUXTON, DERBYSHIRE.—PRIVATE ESTABLISHMENT for the Care and Treatment of a select and limited number of persons Mentally affected.

Resident Proprietor—T. DICKSON, L.R.S.C.E.

Late Medical Superintendent of the Manchester Lunatic Hospital. Wye House is delightfully situated in its own grounds of twelve acres at Buxton, and forms part of the magnificent scenery of Wye Dale. The well-known salubrity of Buxton, and the hygienic effects of its waters and baths, renders it a desirable locality for Invalids Nervously or Mentally affected. Ample means are provided for the occupation and amusement of the Patients, including carriage and garden exercise.

PURE SPIRITS FOR THE FACULTY.

S. V. R. 56 o.p., 16s. 6d. net Cash.—

This quotation admits of neither credit nor discount, and 1s. per gallon must be added for packages, to be allowed on their return.

HENRY BRETT and CO., Old Furnival's Distillery, Holborn.

Crosse and Blackwell, Purveyors in

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloaters Pastes, Strassbourg and other Potted Meats, and Cal's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for Mr. Sayer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of CROSSE and BLACKWELL, 21, Soho-square.

Williams and Son's Pure Glycerine

SOAP. Analysed by Dr. Hofmann, F.R.S., and Professor Redwood, Ph.D., strongly recommended by many eminent members of the Medical Profession, and favourably noticed by the following Medical Journals:—

THE LANCET.
THE MEDICAL TIMES AND GAZETTE.
THE BRITISH MEDICAL JOURNAL.
THE MEDICAL CIRCULAR.
EDINBURGH MEDICAL JOURNAL.
THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate skin (whether arising from disease or otherwise), and is admirably adapted for nursery use. May be had of all respectable Chemists, Perfumers, &c.

SOAP-WORKS, CLERKENWELL, LONDON, E.C.

The Bitter-Water of Friedrichs Hall

enjoys deservedly a very high reputation amongst Medical Men on the Continent, and in directing the attention of the Medical Profession in this country to the extraordinary virtues of this water, we can mention here only a few of the chief diseases in which it has been prescribed with the most beneficial results—viz., Diseases of the Stomach and Bowels, especially Indigestion, Loss of Appetite, and habitual Constipation; Enlargement and Inflammation of the Liver, with or without Jaundice or Dropsy; Diseases of the Kidney, including Albuminuria, Affections of the Sexual Organs, and the numerous accidents which so many women are subject to at their critical age, and the inconveniences resulting from pregnancy; also Hypertrophy of the Heart, Determination of Blood to the Head and Lungs, Hypochondriasis, and Gout, must be mentioned. One peculiar advantage which this water possesses over most other bitter waters is, that it is given only in small quantities—viz., a wineglassful, either before breakfast or on going to bed; that it may be taken at all seasons, and requires neither a particular diet nor exercise in the open air. Further information, with cases, will be found in Dr. Eisenmann's Monograph of this Water, which may be had gratis at Messrs. A. and E. THWAITES and CO.'S, 147, Regent-street, London, and 57, Upper Sackville-street, Dublin, who have just received a fresh supply of this Bitter-water.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

Obstetrical Society of London.—The

next ORDINARY MEETING will be held on WEDNESDAY, Oct. 5, at 8 p.m.; the President, Dr. RIGBY, in the Chair.

The First Session of the Society will terminate in December, up to which time no Entrance Fee will be demanded. The Council beg to intimate their intention of recommending the Society to require the payment of an Entrance Fee of One Guinea, in addition to the Annual Subscription, by Fellows elected subsequently to this date.

Gentlemen desirous of becoming Fellows are requested to apply to one of the Honorary Secretaries.

By Order of the Council, GRAILY HEWITT, } Hon. Secs.
53, Berners-street. THOS. H. TANNER, }

Mr. James Robinson, Dentist, has

REMOVED from No. 7 to No. 5, GOWER-STREET, Bedford-square, London.

Dr. E. E. Barron will resume his

MEDICAL and SURGICAL TUITION, adapted to Gentlemen preparing for PROFESSIONAL EXAMINATIONS, on SEPTEMBER 19th; but the Winter Course will not commence until October 4th.

A VACANCY for a HOUSE-PUPIL.

15, St. Thomas-street, Borough, S.E.

Private Establishment for the Insane,

CHURCH STRETTON, near SHREWSBURY. This Establishment is conducted by the Resident Proprietor, Dr. S. G. BAKEWELL, Son of the late Mr. Bakewell, of Spring Vale, Staffordshire.

The Ladies occupy a separate residence, and are under the immediate care of Mrs. Bakewell.

The neighbourhood of Church Stretton is very picturesque and healthy. Its similarity to Malvern is often noticed.

A Carriage is kept for the use of the Inmates.

References can be given to Medical Gentlemen and others in Shrewsbury, Birmingham, Hereford, and throughout Staffordshire.

Church Stretton is a first-class Station on the Shrewsbury and Hereford Railway, twelve miles from Shrewsbury.

Pillischer's Achromatic Microscopes.—

To meet the daily increasing demand for his Microscopes, M. PILLISCHER has recently completed extensive alterations in his workshops to enable him to manufacture MICROSCOPES and their Object Glasses upon a more expeditious and extensive scale. M. P. has the pleasure of informing the Profession that he is now able to furnish Microscopes of the very greatest perfection; possessing every modern improvement; and with Object Glasses of a quality unsurpassed by any other maker, on the shortest notice, and at very moderate prices.

PILLISCHER'S £7 7s. STUDENTS' MICROSCOPE, for which a prize Medal was awarded to him at Paris Exhibition, 1855, deserves particular notice. It consists of a well-constructed Stand, with coarse and fine adjustments, a capital Stage, with Diaphragm and Large Mirror, one Eye-glass, one and one quarter inch Object Glasses, 16" and 75" angular aperture, and a neat Mahogany Case about 7 in. square. The above, Microscope when further completed with the addition of a Second Eye-glass, Condenser for Opaque Objects, Live Box, Stage Forceps, large Glass Stage, and Polarising Apparatus, price £10, forms a most complete and valuable Microscope, and in every respect as useful as a much more expensive one.

A Catalogue post free on application to M. Pillischer, Optician, 88, New Bond-street, London, W.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Hospital for Sick Children, 49, Great

ORMOND-STREET.—A SERIES of LECTURES on the DISEASES OF CHILDREN will be given every SATURDAY during the months of NOVEMBER, DECEMBER, and JANUARY, by Dr. WEST, Dr. JENNER, and Mr. ATHOL JOHNSON, the Physicians and Surgeon of the Hospital. The First Lecture will be given on SATURDAY, NOVEMBER 12, at 3 p.m., by Dr. WEST.

By order of the Committee of Management,
H. A. BATHURST, Hon. Secretary.

Royal College of Physicians of

EDINBURGH.

At an EXTRAORDINARY MEETING of the ROYAL COLLEGE of PHYSICIANS of EDINBURGH, held on Friday, the 19th of August, the following Resolution was unanimously agreed to:—

"That, in accordance with the opinion expressed by the General Council of Medical Education and Registration, on the 8th August, the Royal College of Physicians of Edinburgh do institute an Examination in Practical Medicine, to be undergone by Candidates, other than University Graduates claiming exemption under the Charter of the College; and that the College agree to alter Law 8 of the Regulations for the admission to the Licence, in accordance with the preceding Resolution."

The opinion of the General Medical Council, as expressed on the 8th August, is all follows:—

"That the General Medical Council is of opinion, that for the future no Licence or Degree should be given by any of the bodies in Schedule (A) to the Medical Act, without Examination."

The eighth Regulation, regarding the conferring of the Licence of the College, ran thus:—

"For one year after the passing of these Regulations (20th April, 1859), Licentiates of any of the existing Licensing Boards may be admitted Licentiates of the College without Examination, provided that they do not derive any profit from the sale of Drugs or Medicine, and that they produce certificates of character and professional qualification satisfactory to the College."

In conformity with the above Resolution, all Applicants under Regulation 8, for the Licence of the Royal College of Physicians of Edinburgh, with the exception of Graduates of British Universities, will in future be required to appear before the Examiners of the College, and to pass an Examination in the Practice of Medicine.

The Stamp-duty on the Diploma having been remitted, the Fee payable by Licentiates is now Ten Pounds.

In name and by authority,

Edinburgh, August 19, 1859. D. R. HALDANE, M.D., Hon. Sec.

Examinations for the Double

QUALIFICATION of LICENTATE in MEDICINE and LICENTATE in SURGERY, to be conferred by the ROYAL COLLEGE of PHYSICIANS of EDINBURGH, and the FACULTY of PHYSICIANS and SURGEONS of GLASGOW, conjointly.

The ROYAL COLLEGE of PHYSICIANS of EDINBURGH, and the FACULTY of PHYSICIANS and SURGEONS of GLASGOW, while they still continue to give their DIPLOMAS SEPARATELY, under separate Regulations, have made arrangements (in terms of the Medical Act), which have been submitted to, and have received the sanction of, the General Medical Council, whereby, after one Series of Examinations, the Student may obtain Two Licences, one in Medicine and one in Surgery.

The object of the joint examinations is to give to Students facilities for obtaining from two separate Bodies, and at less expense, a Double Qualification in Medicine and in Surgery, and thus to enable them to hold various important public appointments, for which, if they only possessed a single qualification, they would be ineligible. Students passing these Examinations successfully will be enabled to enter their names in the Register as L.R.C.P. Ed., and L.F. Ph. & S. Gl.

The College and the Faculty have prepared a Code of Regulations to be observed by Candidates for the Double Qualification, both as regards General and Professional Education and Examination, which may be had on application at the Hall of the Royal College of Physicians of Edinburgh, or at the Hall of the Faculty of Physicians and Surgeons of Glasgow.

The First Examination in General Education under the Code will take place in the last week of October, 1859.

ALEXANDER WOOD, M.D.,

President, Royal Coll. of Physicians, Edinburgh.

JAMES WATSON, M.D.,

President, Faculty of Phys. and Surg., Glasgow.

The Clinical History of the Eastern

DIVISION of the ROYAL MATERNITY CHARITY during 1858. By ROBERT BARNES, M.D., Vice-President of the Obstetrical Society of London; Honorary Member of the Dublin Obstetrical Society; Physician to the Royal Maternity Charity; Assistant Obstetric Physician to the London Hospital, &c., &c.

Also, by the same Author, post 8vo, cloth, 6s.

THE PHYSIOLOGY and TREATMENT of PLACENTA PRÆVIA.

DR. LITTLE ON DEFORMITIES.

In 8vo, with 160 Engravings and Diagrams, 15s. cloth,

On the Nature and Treatment of

CONTRACTIONS and DEFORMITIES. By W. J. LITTLE, M.D., Senior Physician to the London Hospital, Founder of the Royal Orthopædic Hospital, &c.

CONTENTS.

1. Deformities in general. Treatment Operative, Instrumental, and Physiological. Forcible Extension under Chloroform.
2. Contractions from Wounds and Diseases of Joints, Accidents, Rheumatism, &c.
3. Contractions from Spasm, Paralysis, Burns, Habitual Retention in one Position.
4. Deformities from Rickets, Weakness, and Curvatures of Bones.
5. Congenital Distortions and Dislocations, Club-foot, Club-hand, &c.
6. Congenital Malformations, Monstrosities.
7. Distortions of the Spine, from Strumous Disease, Rickets, Latent Curvature, Spasm, and Paralysis.

Appendix : On Relapsed and Neglected Cases. Index.
"The best treatise on the subject in any language."—The Lancet, the British and Foreign Medico-Chirurgical Review, and the Philadelphia Medical Examiner.

On CLUB-FOOT and ANALOGOUS DISTORTIONS, including their Treatment both with and without Surgical Operation. 8vo. Forty-one Engravings. 12s.

On ANCHYLOSIS or STIFF JOINT: a Practical Treatise on the Contractions and Deformities resulting from Diseases of the Joints. 8vo. Thirty-two Engravings. 7s. 6d.

London : Longman, Brown, Green, and Longmans.

MEDICAL BOOKS.

ALTHAUS.—A TREATISE on MEDICAL ELECTRICITY, Theoretical and Practical. By J. ALTHAUS, M.D. 8vo, pp. vii. and 352, cloth, 7s. 6d.

DALTON.—A TREATISE on HUMAN PHYSIOLOGY, designed for the use of Students and Practitioners of Medicine. By JOHN C. DALTON, jun., M.D. 8vo, pp. xxiv. and 608, with 254 Illustrations, cloth, 24s.

DUNGLISON.—DICTIONARY of MEDICAL SCIENCE, 9th Edition, containing a concise explanation of the various subjects and terms of Physiology, Pathology, &c. By ROBLY DUNGLISON, M.D. An entire new edition, revised and enlarged, 1 vol. 8vo, pp. 992, cloth, 18s.

GARDNER.—The CAUSES and CURATIVE TREATMENT of STERILITY, with a Preliminary Statement of the Physiology of Generation, by AUGUSTUS K. GARDNER, A.M., M.D., with Coloured Lithographs and numerous Woodcuts, 8vo, pp. 170, cloth, 14s.

GROSS.—ELEMENTS of PATHOLOGICAL ANATOMY, by SAMUEL D. GROSS, M.D. Third edition, modified and thoroughly revised. Illustrated with 342 engravings on wood, 8vo, pp. xxv. and 771, cloth, £1 8s.

GROSS.—A PRACTICAL TREATISE on the DISEASES, INJURIES, and MALFORMATIONS of the URINARY BLADDER, the PROSTATE GLAND, and the URETHRA. By S. D. GROSS, M.D. Second Edition, Revised and much Enlarged, with 184 Illustrations, 8vo, pp. 925, £1 4s.

GROSS.—A SYSTEM of SURGERY, PATHOLOGICAL, DIAGNOSTIC, THERAPEUTIC, and OPERATIVE. By S. D. GROSS, M.D. Illustrated by 936 Engravings. Two Vols. 8vo, bd. pp. xxiv. and 2360, £3 13s. 6d.

MEIGS.—On the NATURE, SIGNS, and TREATMENT of CHILD-BED FEVERS: in a Series of Letters addressed to the Students of his Class. By C. D. MEIGS, M.D. 8vo, pp. 362, cloth, 16s.

A CATALOGUE of AMERICAN MEDICAL BOOKS will be sent free in Town or Country on receipt of two postage stamps. The greater portion of the Books recorded in the Catalogue are on Sale; those not in Stock are obtained in Forty Days.

London: Trübner and Co., 60, Paternoster-row.

Just Published, Price 3s. 6d., with 200 Descriptive Cases, and Illustrations in Chromo-Lithography,

Amputations and Artificial Legs, HANDS, &c. By W. R. GROSSMITH, of 175, Fleet-street, London.

"Mr. Grossmith has offered some good practical suggestions for the consideration of the operator, and has entered more fully into the subject than has hitherto been attempted."—The Lancet, Nov. 14th, 1857.

"Mr. Grossmith's artificial limbs are well constructed, and on the best system."—Paris Exposition Jury Reports.

London: Longman and Co. Dublin: Fannin and Co.; and from the Author, post free.

On the Constitutional Treatment of

FEMALE DISEASES. By EDWARD RIGBY, M.D., &c.

"We know of no other obstetric writer who so strongly insists on the intimate connexion between uterine and constitutional disorders, or who has carried out this principle so consistently and so successfully. On this account we look upon the work as peculiarly valuable, and calculated to do an immensity of good at the present time, by dispelling the one-sided and narrow views so generally prevalent respecting this class of diseases, and placing their pathology and treatment on a sounder and more rational basis."—Dublin Quarterly Journal of Medical Science.

London: Renshaw, 356, Strand.

Fourth Edition, with Additions, cloth, 22s.

The Principles and Practice of

OBSTETRIC MEDICINE AND SURGERY. Illustrated with 120 Plates on Steel and Wood. By F. H. RAMSBOTHAM, M.D.

"It is THE book of Midwifery for students—clear, and sound in its practical instructions."—Dublin Jour. of Med. Science.

"The work of Dr. Ramsbotham may be described as a complete system of the principles and practice of midwifery. The illustrations are numerous, well selected, and appropriate, and engraved with great accuracy and ability. We regard this work as by far the most able work on the principles and practice of midwifery that has appeared for a long time."—Edin. Med. and Surg. Jour.

"Dr. Ramsbotham has treated the subject in a manner worthy of the reputation he possesses, and has succeeded in forming a book of reference for practitioners and a solid and easy guide for students."—British Med. Jour.

"This is one of the most beautiful works which have issued from the medical press, and is alike creditable to the talents of the author and the enterprise of the publisher. It is a good and thoroughly practical treatise."—Edin. Jour. of Med. Science.

John Churchill, New Burlington-street.

The Price of the Medical Register

having been REDUCED, by order of the Medical Council, it may now be had at the Registration Office, 32, Soho-square, W., at 4s. per copy, or post free 4s. 6d., and every person who has paid 7s. 6d. for the same will be entitled to receive gratis a copy of the Register for 1860.

New ready, price 5s. 6d., or free by post to any part of the United Kingdom, price 6s., Fourth Edition, greatly enlarged and improved,

A Grammatical Introduction to the LONDON PHARMACOPEIA, and a KEY to PHYSICIANS' PRESCRIPTIONS. By F. S. LEACH.

"This little work will be found extremely useful to students who have received but an imperfect classical education."—The Lancet.

Hughes and Butler, Medical Booksellers and Publishers, 15, St. Martin's-le-Grand.

8vo, cloth, 15s.

E Manual of Psychological Medicine.

By JOHN CHARLES BUCKNILL, M.D. Superintendent of the Devon County Asylum; and DANIEL H. TUKE, M.D., late Visiting Medical Officer to the York Retreat.

John Churchill, New Burlington-street.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 28s. per lb.

The Medicinal value of this Scammony was fully explained at a meeting of the Pharmaceutical Society, and reported at length in their journal of March last, from which the following are extracts:—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with.

"A. B. GARROD, M.D., F.R.S., F.R.C.P.

Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens.

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs M'Andrew's scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power.

"GEORGE JOHNSON, M.D., F.R.C.P.

Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

Health, Fresh Air, and Pure Water.

—By Her Majesty's Letters Patent.—CONDY'S FLUID contains NASCENT OXYGEN, nature's true and only purifying agent; instantly removes all offensive smells; renders impure water fresh, and the air pure; when diluted for use, is of a beautiful colour, not soiling the finest linen; is harmless, and particularly adapted for toilet use, being both refreshing and exhilarating. The Medical Profession have expressed their unqualified approbation of its merits. One gallon makes 200 gallons adapted for use. The cooling, healing, gently stimulating and invigorating properties of this Fluid render it, when diluted, a lotion possessing peculiar and valuable characteristics, whether for bathing the bodies of invalids, incorporating in poultices, or washing and healing wounds. Patronised by the Board of Health, and most public departments, hospitals, schools, and adopted by the India Council in preference to all other disinfectants. In bottles, 6d. 1s. and 2s.; stronger and purer, 1s. 2s. and 4s.

CONDY'S PATENT HEALTH POWDER also contains NASCENT OXYGEN, is odourless, and destroys all smells; in bottles, 1s. 6d. and 3s., and in casks of 1 cwt. 30s.—Wholesale agents, John Bell and Co. Chemists, No. 388, Oxford-st. W.; Butler and Crisp, 5, Cheap-side, St. Paul's; Ferris and Co., Bristol.—Chemical Works, Battersea, S.W.

Struve's Seltzer, Marienbad, Vichy

KISSINGEN, and other MINERAL WATERS.—Under her Majesty's especial Patronage.—ROYAL GERMAN SPA, BRIGHTON, STRUVE'S PUMP-ROOM and PROMENADES, offering every facility for a Course of Mineral Waters, as perfect and beneficial as at the natural springs, are NOW OPEN, for the Thirty-fifth Season. A prospectus, with the highest Medical testimonials, may be obtained gratis, at the Pump-room, or from George Waugh and Co. Chemists to the Queen, 177, Regent-street (west-side), London, and other respectable houses in London and the provincial towns, where orders for Struve's Bottled Mineral Waters continue to be executed.

CAUTION.—The success obtained by Struve's Mineral Waters, owing to their perfect identity with those of the natural springs, has induced several parties to attempt imitations, sold as "Brighton Seltzer," "Brighton Vichy," &c., an analysis of some of which has shown an utter disregard of their true chemical composition. To distinguish Struve's Waters from all others, every bottle has a label and red ink stamp over the cork, each bearing Struve's name, without which name none is genuine, though contained in Struve's old bottles.

Professor of Medicine and Midwifery in the University of Edinburgh.

LECTURE XXI.—*Continued.*

SPURIOUS PREGNANCY.—ITS SYMPTOMS AND DIAGNOSIS.

It is not always so easy as you may imagine to recognise a case of this kind, and to discriminate between a case of spurious and a case of real pregnancy, for in the former you will sometimes meet with all the individual and combined phenomena which are ordinarily developed in the latter, and which are usually regarded as characteristic of the pregnant state. The breasts are enlarged, and their areolæ darkened; the menses are often irregular or suppressed, and the abdomen is swollen; the patient suffers from morning sickness and occasional vomiting; and after a time she remarks peculiar sensations in the abdomen, which she unhesitatingly attributes to quickening, or the movements of a fetus. I have said the abdomen is swollen; and, let me add, this swelling sometimes imitates very exactly the defined form of the enlargement of the abdomen in true pregnancy; but usually it is more diffuse and less projecting forwards when the patient is laid supine; and in spurious pregnancy, let me add, there is often observed a symptom in the way of external configuration which is rarer in true pregnancy, viz., an appearance of unusual constriction in the region of the diaphragm, or where the chest and abdomen meet, so that the lower ribs look as if they were drawn inwards. All of these common symptoms of true pregnancy may be, and indeed often enough are manifested in cases of spurious pregnancy; but you will often find, on making more minute inquiry, that there is some startling *exceptional* condition affecting one or more of them. Thus, menstruation is occasionally entirely suppressed—as completely so as in any true pregnancy; but in most cases, it is not entirely suppressed, but only irregular, appearing one month and absent the next, or coming on at irregular and unusual periods, or in some abnormal way. Again, the movements of the supposed child, if carefully investigated, are found to be different in some respects from the usual fetal movements. They may first be perceived unusually early, or, on the other hand, at a period much later than that when the movement of real quickening, should first be noticed; or they are felt higher up towards the diaphragm, or much further to one side than is ever the case with fetal movements. And if you inquire of a patient in this condition of simulated pregnancy who has previously borne children, she will generally admit that the movements differ in character from those which she had been wont to feel when truly pregnant, although she had never paid any particular attention to these differences so long as she believed the sensations to be due to the stirring of a child within her womb. There is, I say, usually some irregularity in the form of some one or other of the leading individual symptoms, although the combination of them all apparently in perfection is at first very striking and extremely puzzling. You must make up your minds to meet, in many cases in the most distinct form, with some of the single symptoms which are looked upon as the most characteristic, and which are ordinarily supposed to be conclusive and incontrovertible evidences of the occurrence of impregnation. Thus the *mammæ* may undergo all the usual changes which occur in these glands during pregnancy, as happened to a very marked degree in the case of a patient whom I had under my care many years ago with retroversion of the uterus. This lady came to present almost all the symptoms of pregnancy, and the changes in the breasts, in particular, were extremely well marked. The *mammæ* swelled; their areolæ were darkened in colour and extended; the cutaneous papillæ became more pronounced, and the superficial veins enlarged and prominent. The lady, as it happened, was an excellent artist, and she

made a sketch for me of the appearances presented at this time by the *mammæ*, making use of a mirror for the purpose. Dr. Radford, of Manchester, was in Edinburgh at the time, and saw the patient along with me. But I could not make out any enlargement of the uterus itself; and some of the other symptoms were not well marked. By-and-by, all the constitutional phenomena of pregnancy vanished, and thus showed that the pregnancy had only been a spurious one. Afterwards the same patient became really pregnant, and again she made a drawing of the appearances presented by the breasts, which were not a bit more tumid, and the areolæ of which were not a bit darker in shade or wider in extent, nor their cutaneous glandular follicles more enlarged than they had been when she had laboured under spurious pregnancy. One symptom connected with the mammary symptoms which is often present, and often greatly deceives, is the secretion of a serous, milky, or milk-like exudation, from the nipples. In some women, but not by any means in all, there is formed a milky secretion in the *mammæ* during utero-gestation; and sometimes even in the very early months of that state. When the *mammæ*, or rather the nipple and its vicinity, are compressed with the fingers, a portion of thin, serous-looking, lactescent fluid, escapes from the orifices of the milk ducts, or it exudes spontaneously and without pressure, and on examining it with the microscope you will see the usual characteristic milk-globules in it. But I have seen these colostrum globules with the microscope in a case of spurious pregnancy as distinctly as they were ever seen in a case of true pregnancy. But marked and striking as these various changes of the *mammæ* in spurious pregnancy thus sometimes are, you will find that here, too, there is liable to be some irregularity in the symptoms. The secretion of the gland is not set up, or the enlargement of the *mammæ* is only slight or partial, or the darkening of the areolæ is not very deep or decided, or the glandular follicles of the areolæ are not correspondingly enlarged. Sometimes all the more usual phenomena of pregnancy are present in pseudocyesis, and each of these phenomena so far a perfect imitation of the same phenomena in the true state of utero-gestation; but their spurious character is brought out when you inquire into the order or succession in which these phenomena have appeared. Thus the patient sometimes observes the swelling of the abdomen or the quickening of the child before the suppression of the menses, and this inversion of the order of the symptoms at once puts you on your guard, and makes you more careful in your inquiries. Again, if you find a want of correspondence among the symptoms of pregnancy described by your patient, it will equally make you suspicious of her state; as, for example, if she spoke of having had the catamenia suppressed for six or eight months, and the feeling of quickening present for three or four months, and yet the *mammæ* were not enlarged, nor their areolæ and nipples in any corresponding degree altered and changed.

Again, in pseudocyesis the liability to deception is greatly increased, and the difficulty of making a true diagnosis of the disease is often augmented by the imitation or repetition in cases of spurious pregnancy of individual peculiarities and special phenomena presented in former real pregnancies. Let me try to impress this fact upon you by stating some instances of spurious pregnancy in which there was presented such a

Repetition of Special Idiosyncracies,

seen in previous true pregnancies in the same patient. Some women, as you are aware, are subject during the course of utero-gestation, to peculiar discolorations or eruptions on parts of the skin; others to neuralgias in various situations; others, to increased secretion of some of the glandular organs; and others to the most remarkable changes in temper and habits. Indeed, there is no limit to the number of peculiar physical signs and functional changes which may be presented by women when pregnant; and when these come to be repeated in the successive pregnancies of the same individual—as is very frequently the case—they may very legitimately be looked upon—and frequently, indeed, they are regarded—as indices of the existence of that condition. But when such a patient happens to be affected with spurious pregnancy, this peculiarity may be repeated, and is then very likely to mislead alike the patient herself and the Practitioner into the belief that the pregnancy is a real pregnancy.

Several years ago I saw, along with the late Dr. Taylor, a

lady who showed all the usual symptoms of pregnancy; and who, at the same time, was covered over the greater part of the body with a papular eruption, such as she had invariably had in all her previous pregnancies, and never at any other period. Yet on a closer examination of that patient she was found not to be pregnant at all; and the eruption, as well as all the other sympathetic changes, was only symptomatic of a state of pseudocyesis. I have seen a case of spurious pregnancy which was peculiar in this respect, that the subject of it had in her successive real pregnancies been troubled with a profuse salivation, which was reproduced along with the other changes in the spurious affection. I saw once a very singular case of spurious pregnancy, where a lady who had previously given birth to eight children, passed one period, and naturally thought she had again fallen in the family-way, because the breasts enlarged and began to secrete milk, while the abdomen became prominent, and she felt movements resembling those of the fœtus. On examining the uterus I found it to be perfectly normal, and only slightly ulcerated around the os; but the lady herself was firmly convinced that she was really pregnant, because, in addition to all the symptoms I have mentioned, she presented this further very peculiar one, that she lost great quantities of hair, and she had always had such a falling out of the hair in her previous pregnancies. This patient, let me just add, had a similar but less decided attack of spurious pregnancy before the birth of her third child. At the famous Gardner peerage trial, a woman, who followed the occupation of a monthly nurse, testified that she could always be perfectly certain of the exact date of her pregnancies from the fact that she fainted whenever quickening took place. Dr. Reid tells of this nurse, that she afterwards came to him as a patient, alleging that she was then seven months gone in the family-way, as she had fainted in the same way as she used to do, and had afterwards felt all the usual signs and symptoms of pregnancy. But on making a more correct examination, Dr. Reid found that she had deceived herself, for she believed that she was so far gone in utero-gestation when she was only labouring under an attack of spurious pregnancy. But the repetition or reproduction in an attack of spurious pregnancy of the exceptional and aberrant phenomena of real pregnancy does not end here. I have told you, that a case of spurious pregnancy may end in a kind of spurious parturition, the patient showing all the usual indications of being in labour; and in such a case, if the patient happens in previous real labours to have presented any special and peculiar phenomena, these are liable to be again produced in the course of the spurious parturition. Thus, Klein reports the case of a patient who had always been the subject of convulsions when in labour, and who became the subject of an attack of spurious pregnancy, ending at the usual period in a kind of spurious labour, which was also complicated with convulsions.

But, I repeat, however closely all the ordinary symptoms of real pregnancy may be represented and simulated in the spurious affection, and however minutely even the individual idiosyncrasies sometimes seen in the former may be imitated in the latter, there is usually some deviation from the ordinary course of events, and some difference in the character, order, or correspondence of the ordinary phenomena, which may serve to put you on your guard, and lead to the discovery of the true state of affairs. Such deviation or difference, however, is generally not of itself sufficient to enable you to decide upon the nature of the case, and you can only be sure that you have to do with spurious pregnancy by having recourse to the aid of

PHYSICAL DIAGNOSIS.

For this purpose you may avail yourself of the assistance of 1. Auscultation; 2. Percussion of the abdominal swelling; 3. Of tactile examination of the uterus; and, 4. Of relaxation of the tense abdominal walls by the use of chloroform or other anæsthetics.

1. *Auscultation* affords in pseudocyesis only negative results, or ought only to afford such. But I have seen more than one case of the disease in which the Practitioner—perhaps led astray by the strong assurances, and fervid belief of the patient herself—has imagined that he heard something like the sounds of a fetal heart, where there was no fœtus present to produce any such sounds. Several years ago I had a lady placed under my care from a neighbouring part of the United Kingdom, in whom a Physician,—who had written a work,

and a very excellent work, too, on Auscultation in Pregnancy,—fancied he had heard, three or four months previously, the sounds of a fetal heart; and, though all due preparations were made, no child was born. It was nothing but a very marked instance of pseudocyesis. It is only necessary for me now, I believe, in the present advanced state of stethoscopic study and practice, to mention the possibility of such an error in order to guard you against the committal of the error itself.

2. *Percussion of the Abdomen* is generally a most valuable means of diagnosis in the discrimination of pseudocyesis. By its aid you can often arrive at an almost absolute certainty as to the spurious nature of the pregnancy. When the abdomen is swelled up and made prominent from the distension of the bowels with gas, you of course obtain a resonant and even tympanitic sound on making percussion over it; whereas, as you all know, the sound is perfectly dull when the prominence is due to the enlargement of the gravid uterus. But sometimes percussion is painful from the oversensitive state of the abdominal surface and walls, and sometimes the amount of fat deposited in these walls, and in the omentum—especially in cases of pseudocyesis occurring towards the termination of menstrual life—diminishes the applicability and certainty of this diagnostic test. In these, and in other cases, you can usually surmount every doubt and difficulty which may exist by having recourse to the two remaining means of physical diagnosis which I have named.

3. *Tactile Examination* is usually indispensable in order that you may arrive at perfect certainty. In using it you must make a careful physical examination both internally and externally, remembering that the result of that examination may be of the greatest importance, and a matter of momentous interest to the patient. On examination, per vaginam, you will feel that the os and cervix uteri are small, and you can make out pretty well that the uterus itself is moveable. But there is a greater difficulty than usual in judging of the size of the body of the organ in such a case. You can often derive great assistance in making your diagnosis of various morbid conditions of the uterus by applying one hand to the fundus externally through the abdominal wall, while you apply one or two fingers of the other hand to the cervix internally through the vagina, for thus you can catch the uterus between the two hands, so as to define and determine exactly its degree of enlargement. And if in any case of spurious pregnancy, by feeling the uterus simultaneously with both hands, we can thus measure its size and make out that it is of nearly normal dimensions, or at least not by any means enlarged to a degree commensurate with the alleged date of utero-gestation, we have a most decisive evidence of the true nature of the affection. Recollect, further, in making this tactile examination of the uterus, that the organ is sometimes in some degree enlarged in pseudocyesis, without there being any disease in it; that the organ may be enlarged also, and to a great degree from fibroid tumours and other organic causes, a combination with pseudocyesis of which I have seen several examples in practice; and above all that retroversion or retroflexion of the non-pregnant uterus often co-exists with pseudocyesis, and often leads to the supposition that the uterus is increased in size, when the apparent increase is merely produced by displacement of the viscus. But in some cases of spurious pregnancy it happens that we cannot succeed in making a perfect and satisfactory tactile examination at all; and why? Because the abdominal walls may be, and often are, naturally thick, the subcutaneous tissue being filled with fat; but, independently of that, there is in many of these cases a firm, unyielding swelling of the abdomen, which you might suppose to be due to the enlargement of a gravid uterus, but which is in reality due to a tympanitic state of the bowels, and a peculiarly tonic condition of the abdominal muscles; and the abdominal walls are so firm and tense, and resist the pressure of the hand so effectually, as to render it utterly impossible for you to make out the size and contour of the uterus. Now, how are these obstructions to be overcome? Very simply, by the use of anæsthetics.

4. *Chloroform* will generally, in any case of doubt, solve the difficulty completely, if only given deeply enough. When the patient is fairly put to sleep with chloroform the tense abdominal muscles become perfectly relaxed, and on pressing on the abdomen, you will find that the walls will give way before your hand, and sink backwards till you can feel the spinal

column quite distinctly, and you then find the uterus to be of normal size. The phenomena presented by that phantom tumefaction of the abdomen while the patient is being anæsthetised are very singular. When the patient lies down on her back, and the abdomen is uncovered, it is seen to be projecting, swollen, rounded, and defined, like the abdomen of a pregnant woman; but generally, as I have said, with an appearance of unusual constriction around the lower edge of the ribs. No change occurs during the first stage of the administration of the anæsthetic, and until the period of excitement has passed over, the swelling continues, and the muscles remain rigid and tense as at first; but gradually as that stage passes off, and the respiration offers to become sonorous, the muscles begin to be drawn in, and the abdomen slowly flattens, until it assumes its proper size, or even becomes depressed and relaxed, like the abdomen after delivery. So long as the patient remains in a deeply anæsthetic state, you can make the most complete and satisfactory examination of the state of the uterus, and, indeed, of all the abdominal organs; and you may have recourse to this expedient with perfect safety and success in doubtful cases of real pregnancy also. But when she comes out of her sleep again, in a case of spurious pregnancy, the muscles begin to arch up and to become tense as before, so that by the time the patient is fully awake the abdomen is as large and rounded as ever, and the necessary examination again becomes painful. For, as I have already hinted, the patient has sometimes in pseudocyesis a degree of tenderness in the abdomen that renders her very intolerant even of a slight amount of pressure. The patient having wakened up and found the apparent tumour still present, falls herself to be convinced of the fact that it had, for a time, been dispelled. But you may, perhaps, convince some of her friends of the absence of any real tumour, and their corroborative assertion may go far to bring her to a sound and proper belief afterwards. I had once a poor peasant's wife, from Berwickshire, with spurious pregnancy, who bothered all her friends, and kept them in a state of continued anxiety and trouble, because she was always going into labour, until she had arrived at a period which corresponded in her reckoning with the thirteenth month of utero-gestation. She was one of those persons whom it was utterly impossible to convince by any argument of the true nature of her affection; and her great confidence in the reality of her pregnancy had imposed on her friends, and led them for long to share in her kind of monomania,—for, after all, the mind is really in such a morbid state in some of these cases as to deserve the name of monomania. Having put her under the influence of chloroform, I called her sister into the room, and made her feel the spine through the collapsed abdominal walls, and succeeded thus in demonstrating to her entire satisfaction that there was no child in her sister's abdomen. But the patient waking up, and finding no change in her condition and form, might have remained unshaken in her belief, and, indeed, was still for stoutly affirming that she was pregnant, when her sister shut her up with, "Haud your tongue, woman! You've naething in your wame, for I felt your backbane myself with my ain hand!" I have no very satisfactory explanation to offer you of the nature of this very strange abdominal swelling, and of the peculiar phenomena observed in it, when the patient is in a state of anæsthesia. Some years ago I made a number of observations on some of our Hospital patients, to try and solve the difficulty. Some Medical friends who had been told of the remarkable effect of the chloroform were quite certain that the swelling must have been due to distension of the bowels with gas, which, they averred, must have escaped unobserved when the sphincter was relaxed during the deep sleep induced by the drug. But that this was not the proper explanation we easily proved by introducing a tube into the rectum, and putting the free end of it under water, and then finding that no bubble of air escaped during the anæsthetic subsidence of the swelling. I believe that the phenomenon most probably depends on some affection of the diaphragm, which is thrown into a state of contraction, and pushes the bowels downwards into the abdominal cavity. I am the more convinced that this is the true explanation from the fact that you can sometimes make the abdominal swelling disappear for a second or two, by getting the patient to take a deep inspiration, and then suddenly breathe out again. But, whatever be the explanation, the value of anæsthesia as an adjuvant in aiding and establishing a correct diagnosis of such cases cannot be overrated.

ORIGINAL COMMUNICATIONS.

REMARKS ON THE
HYPODERMIC TREATMENT OF DISEASE,

WITH CASES AND EXPERIMENTS.

By CHARLES HUNTER,

Late House-Surgeon to St. George's Hospital.

(Concluded from page 388.)

RÉSUMÉ OF CASES DETAILED SHOWING OBJECTS OF THE TREATMENT.—SLEEP NOT A NECESSARY EFFECT.—REMARKS ON THE SICKNESS WHICH MAY ARISE.—THE CHOICE OF CASES.—OCCASIONAL CASES, AS RHEUMATISM AND INFLAMMATIONS WITH PAIN.—THE CHOICE OF NARCOTICS.—CHLOROFORM CONSIDERED AS AN OCCASIONAL AGENT.—EXPERIMENTS ON ANIMALS, AND A CASE GIVEN.—CONCLUSIONS.

BEFORE arriving at any general conclusions as to the value of the injection of medicines beneath the skin, it will be advisable, and further the object in view, to make a slight summary of the cases previously detailed; for, by so doing, its value and superiority, if it have any over other means, will be the better ascertained. It will be convenient also in this place, to consider a few of the points which naturally suggest themselves to our inquiry, such as the frequency of sickness, the choice of cases, and of narcotics.

The cases detailed were fifteen in number, including the two in which I first tried the local injection of Dr. Wood. A brief review of the cases is the more satisfactory for these reasons—1stly, because in all of them the same narcotic, the acetate of morphia, was used; 2ndly, because they had all been under other treatment previously without avail, and in most of the cases it was the same preparation, administered either by the stomach, or skin, which had previously failed.

All the cases were affections of the *nervous system*; nine of the brain, two of the brain and spinal cord, and four of particular nerves.

Although a narcotic, and the same narcotic, was used in every case, it was not always with the same object; thus, in some it was to procure sleep, in others, to ease pain or allay spasm, and in others, again, to attempt to palliate or cure some neuralgic affection.

Three of the cases were *neuralgia*, which had all failed to receive benefit under other treatment, although in each case it had been very varied. The two first received great benefit, firstly, from Dr. Wood's plan, and subsequently from my own, as stated in the *Medical Times and Gazette*, October 30, 1858; but the ultimate result of the treatment in these two cases has not yet been given.

Case 1.—The man with constant *tic-douleur* of four years' duration went out cured, the injection of the morphia being at one time used three times a-day, so as to keep up a full and continued influence to prevent, as long as possible, a recurrence of the attack; it was then gradually left off, and the man went out free from neuralgia about a week after the cessation of treatment. The injection was always made in one or the other arm, the site being varied each time; no local inflammation ever occurred, nor was there ever any sickness.

Case 2.—The girl with neuralgia and disease of the eye went on with the treatment till the pain gradually diminished; she then left the Hospital. The treatment in this case, owing to its nature, could only be palliative. The disease has now attacked the brain (having destroyed the eye), and she is now (June) being treated by this plan of treatment in another of the London Hospitals, as nothing else seems to ease the pain or give her sleep. No sickness ever followed the injection of narcotics, but frequently did their administration by the stomach.

The third case of neuralgia was cured by a single injection, although the case had resisted many other forms of treatment. Sickness took place in this case, and was considerable. The cases of delirium tremens were two. Morphia in the first, and opium in the second, had been given in large and repeated doses, with no decided effect. In both, the first injection caused sound sleep of many hours' duration; and both went out cured in a few days. There was no sickness in either case.

The cases of mania were two. They both showed the

sleep could rapidly be obtained by the injection of morphia, which effect had not been obtained by doses as large, and larger, given by the stomach. There was no sickness in either case.

In the first case of *puerperal mania* the injection was used only once; sleep followed in eight minutes. The patient subsequently recovered by the internal administration of large doses of Battley's sedative. In the other case, several injections were employed, sound sleep following each time. There was no sickness in either case.

In both the cases of *wakefulness*, sleep was rapidly induced; and in one patient excitement, almost amounting to delirium, was quelled by a single injection.

In the case of *chorea* the effect of the injection was always very rapid, sleep resulting in about four minutes if the quantity injected was large, and if small, the violence of the movements was diminished or arrested. No sickness was ever produced.

In the case of *tetanus* sleep resulted at once, although the spasms remained unaffected. In a second case of *tetanus* in which this treatment has been used, two hours' sound sleep followed the injection, and afterwards the patient dozed for several hours; laudanum had been previously given every hour without effect. The spasms were never violent in this case, and were observed to cease during sleep.

Both cases of *sciatica* went out free from all pain, the one that was cured was a little sick after the first injection; in the other case the pain returned in a milder form.

Such was the result of the treatment in the cases already given, the result was different in the various cases, even as the object was different with which the injection was employed. Sleep was the result in most cases, but not in all; spasm was quieted in some, and pain was relieved or cured in others by a single or by more injections.

With regard to the sleep occasioned by the injection, it must not be looked on as a necessary effect of the treatment, it may follow at once, after a time, or not at all, according to circumstances. Thus it may follow—*At once*, if the quantity injected is large, and the object is less to ease pain than to procure sleep. *After a time*, if the quantity is large (say one grain of morphia) and much pain exists; in which case the pain is generally quieted directly, and sleep follows in from fifteen to thirty minutes. *Not at all*, when the quantity injected is small, and there is much pain, spasm, or cerebral excitement going on, in which cases, as the quantity is small, the whole effect of the narcotic is expended either in subduing the pain and spasm, or allaying the excitement.

The Occasional Sickness.—In the fifteen cases, sickness occurred in only two, in one it was distressing, in the other but very slight.

In another series of fifteen cases, of which I have notes, sickness occurred in four, in one it was considerable, and in the others to no extent.

Consequently in thirty cases only two patients, both of them women of very nervous temperament, and both suffering from *tic-douleur*, had considerable sickness; in the other four, all men, with *sciatica*, the sickness was trifling; in fact, the patients themselves thought nothing of it, nor did they think it due to the injection. This cannot be called a large proportion when it is recollected how often morphia causes sickness when given by the stomach; I have constantly seen it in a quarter of a grain, and laudanum in equivalent doses, cause sickness so administered.

The time when the sickness comes on varies; in the two cases in which it was severe, giddiness, and nausea were felt almost immediately, then faintness, till in about five minutes sickness took place; in both it continued on and off for several hours, with intervals of sleep. In the four other patients the sickness did not come on for many hours, in fact, only as a kind of ultimate effect of the morphia after a good sleep.

Cause of the Sickness.—From the preceding remarks it appears that sickness may be looked on as either a first, or as a last, effect of the narcotic. That when a last effect, it is but trifling, coming on after many hours' sleep, preceded for a little while by nausea, and disappearing generally after the patient has been once or twice sick, with scarcely a straining effort. A slight excess of the narcotic may be looked on as the cause of this sickness. But in both the cases in which the sickness was urgent, the patients, both women, besides being as above stated highly nervous, were both badly affected by narcotics, however administered; in both, the

quantity injected was less than was employed in the cases where slight sickness ensued, and in many cases where none at all took place,—in the one less than a third of a grain, and in the other a little more than half, was the quantity injected. The cause of the sickness in these two cases, as it was so immediate, seems to have been due rather to a peculiarity in the constitution of the patients, than to the amount of the narcotic employed.

Ought the occasional occurrence of severe sickness to cause the injection of remedies to fall into disuse? I think certainly no more than it ought the introduction of narcotics in other ways, because sickness occasionally follows their administration. But as medicines, hypodermically introduced, act with greater rapidity and effect than when administered by other methods, it behoves us to be the more careful in the selection of proper cases; and where it is desirable to employ the treatment in such cases as the two where sickness occurred directly, to inject a much smaller quantity than usual; for it is not improbable that in those two cases, as benefit resulted in both, that a still smaller quantity would have sufficed.

The Choice of Cases.—This plan of treatment is no specific; because it acts marvellously in some case of neuralgia, or of pain, is no reason why it should cure all. For this reason, a due discrimination of cases ought to be made. The same caution is given by Dr. Wood in his paper on the treatment of neuralgia by local narcotic injections:—"Another caution I would offer is, that you choose the proper patient for the use of the remedy." (a) When to employ the injection, and when not, must depend in the general way on the particular circumstances of each individual case, such as the nature of the disease, its urgency, the object in view, etc.

There are some cases in which I think the hypodermic injection may almost be employed as a rule, and be put in force before time is lost by the adoption of other measures. I mean those cases of high cerebral excitement, of delirium tremens, and of mania, in which the speedy administration of a narcotic is indicated. In this class of cases more than any other the value of the injection is seen. I have already detailed seven cases of this nature, and could give many more, but there hardly seems the necessity. In these cases, to procure sleep and allay excitement is the object, and that as soon as possible; the stomach is often irritable, or in such a state that it will not absorb medicine; the patients often refuse to swallow (as in Mr. Cutler's case); everything, in fact, points to the necessity of some more sure, speedy, and active mode of treatment than the more ordinary one of stomachic administration.

There are cases of sudden, violent, acute pain, in which the injection might also be tried as a primary measure; for instance, during the passage of a renal calculus, in such a case the pain is at times almost insupportable, and as the stomach gets quickly irritable, sickness often taking place, another reason is furnished for the trial of this plan.

Then there are cases in which the injection ought not to be tried at first, but after such general treatment as is clearly indicated has been first tried—such as purging, or the internal administration of alteratives or tonics. *Tic-douleur*, *sciatica*, and many other neuralgic affections are of this class. In all such cases, due discrimination being made, it is astonishing what benefit follows the injection in most cases, and how quickly in many, a cure is effected by it when other treatment has altogether failed. It is often, too, in those cases the origin of which is most obscure, that the injection seems to answer best.

Rheumatism is a disease in which occasionally the use of the injection into the cellular tissue will be found highly serviceable. Two cases have been treated by it at St. George's Hospital:

1. (Case 16.) Under Dr. Page, a man almost crippled by rheumatism, had the pain greatly mitigated by the injection.
2. (Case 17.) Under Dr. Pitman, a man that could not move his arm after acute rheumatism on account of pain in the shoulder. The pain was removed by a single injection.
3. (Case 18.) A gentleman under my own care, who

(a) My object in alluding to this passage (*British Medical Journal*, August, 1858) is this,—that as I do not find localisation to the painful part necessary, my plan is available in many diseases in which that of Dr. Wood is not—as mania, delirium tremens, etc. It is also applicable in some cases of pain and of neuralgia in which Dr. Wood's cannot be—viz. those in which the nerve cannot be reached for injection. There is, therefore, a greater need of caution to discriminate proper cases where the range is wider, than where it is more limited.

suffered acute pain in the shoulder and arm which prevented his moving the limb and sleeping at night. It was removed after two or three injections.

There are many diseases in which the pain accompanying them must be looked on, not as the essence, but as a *very important* item, which keeps up the disease and which prevents treatment doing any good, but which, once subdued, then the inflammation or whatever the cause is, rapidly becomes affected by the treatment which it had up till then resisted. In such diseases, the injection may do much, and that speedily, and certainly deserves a trial.

Case 19.—The following is a case where the patient, having a peculiar destructive inflammation of both eyes, suffered almost uncontrollable pain, which was unexpectedly cured by the hypodermic injection:—

T. B., aged 41, was admitted April 12, 1859, into St. George's Hospital, under the care of Mr. Tatum. For the first three weeks he suffered acutely, the conjunctiva of both eyes was greatly chemosed, red, and tender; for the greater part of this time he *seldom closed his eyes day or night*, notwithstanding leeches, blisters, calomel, and opium, and finally morphia, a quarter of a grain every three hours, were employed. The injection of half-a-grain of morphia into the arm was then tried—it eased him for some hours, but did not cause sleep. Two days after the injection was again employed, one grain being used this time: the patient describes the effect of the injection “as something which instantaneously ran through his frame, round his head, and which seemed to go out of the back of it.” *The pain was gone*, and he slept in about ten minutes. The sleep lasted six or seven hours. The patient went out about three weeks after the second injection, during which time he had no more pain, and slept well every night.

Thus there are cases where this treatment may be employed, and, as shown above, with the greatest advantage—1. As a primary measure, at the onset of the disease, without delay; 2. As a secondary measure, general treatment being first used; and, 3. As an ultimate measure, to attempt to palliate or cure, where other treatment has failed.

The Choice of a Narcotic.—This must depend entirely on circumstances, such as the sex, the peculiarities of the patient, the disease, and the object in view. It is not my intention here to go into these points as they require almost equal consideration before the administration of a narcotic by any method, but rather to indicate in this place the *most eligible preparations for injection*.

Tinctures may, and can be, used with good effect. Thus Mr. Burns used equal parts of the tinctures of opium and hyosciamus (b). I have employed both these tinctures separately, and have found this objection to them, that they cause a little hard lump beneath the skin which may last a considerable time, and gradually disappears if left quiet, and alone. There is not this objection if the tincture be evaporated to one-half or one-third, and be used while it is fresh.

Dr. Wood has used a solution of morphia in sherry wine as “it would not irritate and smart so much as alcohol.” He also says that “*nepenthe*” produces less sickness than opium, and is therefore preferable as an injection (c). Professor Simpson has used a solution of the bimeconate of morphia in coccodynia (d).

For my own part, I *prefer solutions to tinctures*; they are rapidly absorbed, they produce no irritation if properly made, and they have this advantage, viz., of exactness, so that no mistake need be made about the strength of the preparations, or the quantity injected.

A solution of the acetate of morphia is the preparation I have used more than any other, prepared with acetic acid, but so freed from excess of that agent, that it causes not the least irritation (e). Mr. Williams, of Liverpool, who has tried the narcotic injection in delirium tremens, has proposed to me the employment of the sulphate of morphia on account of its ready solubility.

A solution of the sulphate of atropine is a good preparation for injection, and not liable to irritate. I have several times employed it, and produced sound sleep with doses varying from the $\frac{1}{2}$ to the $\frac{1}{10}$ of a grain. The injection of

this salt has been employed with a different object by Mr. Benjamin Bell, viz., to counteract the effects of opium poisoning as first suggested by Dr. Thomas Anderson (f).

Is Chloroform applicable for Hypodermic Injection?—Chloroform is a narcotic which may be, with safety, injected into the cellular tissue in *urgent* cases; it rapidly produces cessation of spasm, and causes sleep.

In numerous experiments which I have made with this narcotic on animals, I find that the effect on rabbits, when injected in small quantities, is somewhat analogous to that of opium in small doses, but in larger is more productive of anæsthesia than of coma. Thus in

Experiment 1.—Ten minims caused temporary protrusion and congestion of the eyes for a minute or two, but no anæsthesia.

Experiment 2.—Fifteen minims caused it to become unusually quiet in three minutes. Gradual relaxation of the muscles till it was prostrate in *eight* minutes. Brain clear, no anæsthesia. The effect went off in from fifteen to twenty minutes.

Experiment 3.—Thirty minims caused excitement for a minute or so; muscles began to relax in three minutes; no decided anæsthesia, but sensibility dull, and the animal inclined to sleep. Effect over in thirty minutes.

Experiment 4.—Forty minims caused general excitement in one minute; anæsthesia commenced in *two* minutes, and considerable muscular relaxation in *three*, in *five* it was anæsthetic, and the muscles relaxed. The animal was for the most part completely anæsthetic for the space of an hour, during which time any operation could have been performed unfelt by the animal. At the end of the hour the effects gradually went off, leaving no bad result.

From these experiments it is manifest that—firstly, not only was the effect proportionate to the dose; but, secondly, that the *stronger* the dose the more *quickly* was anæsthesia produced; it is, thirdly, to be observed, that there was not the least subsequent bad effect, either locally or constitutionally.

Bearing in mind these results, and having a patient suffering frightfully from neuralgia of years' duration, on whom all ordinary medicine was lost, I was tempted to endeavour to give him sleep and relief from spasm for a time by the injection of chloroform. Although accustomed for years to inhale, and even swallow, enormous quantities of that agent, and to take other narcotics in similarly large doses, the first injection of mxxx . of chloroform, slowly introduced, caused almost instant quiet of spasm, and sleep in fourteen minutes. The injection of chloroform was several times repeated at intervals, at the urgent request of the patient, who each time obtained considerable relief from it. I left it off, however, on account of the local symptoms, which took place at some, but *not all*, of the places injected; and because of these local effects, I think the injection of chloroform is *not to be recommended*. These local effects were—firstly, pain at the moment of injection; secondly, in a few minutes the skin of the part injected became of a bright red colour, elevated, and tender to the touch; and giving, thirdly, for a short time, the feeling of crepitus. At the end of twenty-four hours all these symptoms disappeared, the swelling going away, and the redness being replaced by a brown stain like a macula. From ten to fifteen days after, nothing was to be seen or felt, although a sensation of tenderness or pain was still experienced in the part by the patient, *but no abscess resulted at any point*.

Leaving for the present the consideration of the *modus operandi* of this plan of treatment, we may, partly from the experiments on animals, but *chiefly* from the cases just reviewed sum up with the following *practical conclusions*:—

1. That certain medicines may be introduced into the cellular tissue beneath the skin with safety and with advantage.
2. That medicines so introduced have a *general* as well as a local effect.
3. That the general effect of medicine so introduced is exceedingly rapid.
4. That this mode of administration is *more certain* in its action than stomachic doses are, for the *exact* amount introduced is known, and the whole of it takes effect, which may or may not be the case with stomachic doses.
5. Medicines are *more purely received* into the system by this method than when given by the stomach, in which organ they may become contaminated or decomposed.

(b) *Medical Times and Gazette*, October 16, 1858.

(c) *British Medical Journal*, August, 1858.

(d) *Medical Times and Gazette*, July, 1859.

(e) *Ibid*, March 26, 1859.

(f) *Edinburgh Medical Journal*, July, 1858.

6. A given amount of a medicine employed hypodermically has a greater effect than the same amount administered by the stomach; *it also acts more quickly.*

7. A given amount of a medicine employed hypodermically has a greater and more rapid effect than when employed *endermically.*

8. That the medicines for which this mode of introduction is especially applicable are the various *narcotics and sedatives.*

9. That the *diseases* for which this plan of treatment is especially indicated are for the most part *affections of the nervous system* :—

1stly. Where the immediate and decided effect of a narcotic is required.

2ndly. Where narcotics administered by the usual methods fail to do good, and yet are indicated.

3rdly. Where the effect of a narcotic is required, and the patient *refuses to swallow.*

4thly. Where from irritability of the stomach or other cause (such as idiosyncrasy, etc.) the patient cannot take the medicine by the stomach (Case 2).

10. That to produce a general effect it does not signify whether the remedy be injected into the cellular tissue of the body or of an extremity.

11. That to relieve or cure a local neuralgic affection there is no necessity to localise the injection.

12. That whether the object be to treat a local or general affection, it seems advisable each time to change the site for injection, should it be more than once required.

30, Wilton-place, Belgrave-square.

ON CYANOSIS,

AND

THE NATURE AND VALUE OF TEMPORARY BASIC SYSTOLIC MURMUR.

By WILLIAM TILBURY FOX, M.D. Lond.

University Medical Scholar.

(Concluded from page 210.)

I wish to make a few remarks upon the existence and production of murmur in cyanotic cases. I refer to basic systolic murmur, having its point of greatest intensity at the second left (pulmonary artery) cartilage, not heard in the course of the aorta, and which indicates pulmonary obstructive disease.

Such a murmur may be *permanent* or *temporary*. Firstly, as to permanent murmur. What is its cause? In the great majority of cases it is due, no doubt, to obstruction seated at the pulmonary orifice. The point I wish to ascertain is, whether patency of the foramen ovale can produce such a murmur? And further, if such be allowed, would the murmur possess the characters stated above? Let me take the latter question first. On *a priori* consideration, would a murmur if caused by patent foramen ovale be systolic? I answer, No. What happens during the systole (ventricular),—that is, at the early part of the auricular diastole,—at which time the murmur is said to occur? The tricuspid and mitral valves close, and murmur can be effected only through the agency of the auricles themselves, of course. When the ventricular systole occurs, the auricles have just commenced to receive blood, there is no “rush,” no contraction to produce murmur at the foramen ovale, the flow into the auricles is passive, so to speak, gradual, and one auricle is being equally distended with the other. If there be a difference, perhaps the flow of blood into the left auricle is the more powerful, since the *vis-a-tergo* (derived from the contraction of the right ventricle) exerts more force upon the left auricle than the *vis-a-tergo* (of the left ventricle) upon the right auricle, and, consequently, in many conditions of the valve the extra pressure of blood on the left side of the heart (auricle) would completely close the patent foramen ovale. At any rate, it is a gratuitous assumption to suppose that there is a greater flow of blood (or pressure) on the right side of the heart, in consequence of which a current is established through the foramen ovale from right to left.

Now it is during the ventricular diastole that the greatest flow (rush) of blood into the auricles takes place, for the

auriculo-ventricular valves then open, and allow the blood to flow on direct from the great veins into the ventricles. The flow is equal on either side, and there is no reason to suppose that any cause is in action which enables the one auricle to receive blood more rapidly or more easily than the other; that is to upset the balance of pressure on the two sides, and thus causes a rush through the foramen ovale.

This flow of blood into the cavities reaches its acme when the auricles and great veins contract, that is, towards the end of the ventricular diastole (auricular systole), and it is at this time that we should expect a murmur to be produced at the foramen ovale (that is presystolic), especially if there exist, (as is usual in the majority of cases), obstruction to the onward progress of the blood from the auricle. Ex.—Pulmonary obstruction, which will cause the blood then to travel through the foramen ovale, from the right side. If obstructive disease of the left side existed, might not the obstruction felt by the right auricle, be relieved by a current from left to right, if the foramen ovale were in a favourable condition for such an occurrence? It is pretty clear that at no time of the heart's action is there such a relative inequality of force exerted by the auricles upon the contained blood, sufficient to set up a current of blood through the foramen ovale (from the stronger to the weaker side), and capable of producing murmur, except during the auricular systole, when obstruction exists to the onward flow of blood on one side (that from which the current passes). Ex.—In pulmonary obstruction the flow would be from the right auricle to the left side of the heart.

It is erroneous to suppose that such a murmur can be systolic. The auricles are clearly not endowed with any great amount of dilating force, that which they exert in highest amount is just before the ventricle contracts. The dilatation cannot be considered as causing a murmur, since it is a slow process occupying seven-eighths of a whole period, *i.e.*, from one pulsation to another. (The *vis-a-tergo* is small, and the larger veins do not assist in causing the dilatation of the auricles.)

From these considerations, briefly expressed, it follows that a murmur produced at the foramen ovale should be presystolic, and that obstructive disease of one side (which usually is present on the right side) is the most favourable help to its production.

Now, what evidence has been brought forward in regard to the production of murmur at the patent foramen ovale? Uncomplicated cases are very rare; usually there is pulmonary obstructive disease present to account for the murmur. I do not forget Dr. Ogle's remarks and cases. Dr. Bennett, in his “Clinical Medicine,” relates a case in which there was “a systolic sound running into second—peculiarly whizzing, not constant, not propagated along the great vessels, heard most distinctly at the base;” and he suggests that it was produced by patent foramen ovale, which was found post-mortem.

But there existed the following lesions in addition:—The right ventricle was much dilated, and walls thin, “tricuspid admits four fingers;” the other valves were healthy. (In septum auriculorum large opening, admits three fingers; evidently foramen ovale much enlarged, edges oval and smooth.) The pulmonary artery dilated, calibre of aorta diminished, half the size of the pulmonary artery. This case, of course, is questionable as evidence of murmur produced by patent foramen ovale.

Cyanosis is not stated to have been present. The patient had phthisis (both apices), and the murmur at the base is said to have been “not constant.” The bearing of these two conditions will be presently seen.

Dr. Markham's case, published in the *British Medical Journal* for April 4, 1857, is well known, and certainly appears to prove that a murmur may be produced at the foramen ovale. The conditions were as follows:—At base existed “a loud rough systolic bruit, audible along the base of the heart, and in the whole of the left subclavicular region it was indistinctly heard below the nipple, and scarcely audible at the heart's apex; its point of greatest intensity was to the left of the upper part of the sternum. It was not audible up the right edge of the sternum, along the course of the aorta.” Subsequently, “it was distinctly heard over all the præcordial region, and over the upper part of the sternum, and along its right border. It was also heard remarkably loud in the whole of the upper half of the interscapular region—equally loud on either side

of the spine." The patient had phthisis. Nothing was found post-mortem but a patent foramen ovale, with a peculiarly-adapted valve, "which allowed" (?) blood to pass from the right side of the heart to the left, but not *vice versa*.

Dr. Markham not finding any other cause, concluded that the murmur was produced at the foramen ovale. The murmur was systolic. I have given reason why murmur producible at the foramen ovale should be presystolic. Drs. Quain and Peacock, who examined the heart, stated in their report that the heart had been a good deal injured by previous inspection; so far as it was possible to judge, there was nothing abnormal in the cavities, the valves, the inlets, or outlets of the heart, save in the condition of the foramen ovale. (*Medical Times and Gazette*, April 11, 1857.) But of the absence of any other cause, I cannot feel so certain, and do not believe that, "on any other supposition, the bruit seems inexplicable." The size of the foramen ovale was really insignificant; it admitted "the point of a finger." The general aspect of the case was certainly too grave (independently of the phthisis) to be fully or partially accounted for by the condition of the foramen ovale. The clinical history of patent foramen ovale is not of any serious import. Could the condition which existed produce commencing cyanosis, violent heart's action, etc.? It will be noticed that at the first examination by Dr. Markham the murmur was not heard (as at the subsequent examinations, along the course of the aorta, and over the whole præcordial region); therefore the cause of the murmur had become more developed. A year before the patient had been under the care of Dr. Sieveking; and it does not appear that anything abnormal was present then in the cardiac region. The condition of the valve seemed to indicate that it had not undergone any recent change, and hence could not account for the change in the physical signs. Now, the very fact of the murmur being heard at the second examination over the upper part of the sternum, and along its right border—and most especially in the whole of the upper part of the interscapular region, equally loud on either side of the spine—would certainly have led me to look for the cause in increasing contraction of the aorta in some part of its arch. It does not appear that the thoracic aorta was examined. The fact of hearing the murmur in the back "remarkably loud," is dead against the idea of its being produced by such a state of the foramen ovale as was present. It is a very great pity that the bronchial glands and the whole tract of the thoracic aorta were not examined. Such a cause as is suggested here would fully account for the physical signs, and for the severity of the symptoms referable to the heart itself. The murmur was heard equally well on either side of the spine, and over the top of the sternum, the contraction, if it existed, was seated somewhere in the middle of the arch. Compare the above with a case related by Dr. Walshe, *Medical Times and Gazette*, October 17, 1857.

Dr. Markham fancies that the murmur was produced by a rush of blood from the vena cava into the auricle, and through the foramen ovale, from right to left. The greatest rush is presystolic. What proof was there, too, that a current would pass from right to left, for the pressure of blood in the left auricle would rather predominate (and shut the valve in Dr. Markham's case), especially since the physical signs indicate that aortic obstruction (arch) existed, which would tend to increase the pressure on the left side (auricle), and favour a current from left to right. Dr. Markham's case is open to these grave objections.

So much for permanent basic systolic murmur. But we sometimes get a murmur which seems permanent, indeed, we think it so, and at the post-mortem we cannot find any cause sufficient to account for it. I speak from practical experience. A patent foramen ovale may exist perhaps, and to it we may ascribe the murmur. Such a murmur is often really temporary. Attention should be directed to this matter because a late American observer, Da Costa, has recently, in the *American Journal of Medical Science*, for January, 1859, pointed out the occurrence of such a murmur at the base, and temporary in character, as diagnostic of phthisis. Why this bears on the question of cyanosis is, because in recorded cases (Dr. Bennett's before quoted) a temporary basic murmur existed and was supposed to be produced by patent foramen ovale—an error, probably. The peculiarities of the murmur in Da Costa's cases were the following: It was basic; point of greatest intensity, second interspace, on the left side, not

constant, systolic, not propagated along the great vessels, not always of equal pitch, heard best during excited action of the heart, and at the end of expiration; often limited to expiration; heard least in inspiration; heard better when patient was standing up than lying down; the ordinary sounds were not influenced, except the second; rarely accentuated, no venous nor arterial murmurs. The patients were all phthisical, or nearly all. No doubt it existed at the pulmonary artery, and was produced there. Da Costa explains the matter thus (which by-the-by is not an original idea), "by want of unyielding textures surrounding the pulmonary artery or one of its branches (?) during the diastole or expansion of the vessel, and when the blood is propelled through it;" and he says it is "caused by the pressure of tuberculous matter." Now I know practically that such a murmur may frequently exist in a phthisical subject, and no such cause be found in the dead house. Da Costa draws a most mischievous inference. He observes: "On the whole, however, the cases show that where slight changes are observed at the apex of the left lung with symptoms which lead to a suspicion of tuberculous, where there is an absence of any symptoms or signs which point to a previous attack of pleurisy or pneumonia, and which would account for the physical signs at the apex; the presence of a localised systolic blowing sound at the left side, unaccompanied by venous murmur, ought to have decided significance."

Now I do not admit any such general assumption; the clinical history of phthisis is opposed to such a view. In a clinical lecture delivered by Dr. Jenner some time ago (during the time I was his resident assistant at University College Hospital), illustrated by a series of very interesting cases in the Hospital, and subsequently published in the *Medical Times and Gazette*, March 1, 1856, Dr. Jenner drew attention to the fact that such a murmur might be produced in a chest of narrow antero-posterior diameter. In expiration or by pressure exerted by the stethoscope of the auscultator, in a yielding chest, the chest-wall came in contact with the pulmonary artery, and so narrowed its calibre as to produce murmur, disappearing during inspiration, or not producible by slight pressure, not constant, etc. Such a murmur can be produced in a chest of narrow antero-posterior diameter in the way indicated in some adults independently of phthisis, (I admit,—but rarely.) To regard it, at any rate, as diagnostic of phthisis in every case, is incorrect. Phthisical people have narrow chests, and in such cases a murmur may be produced as stated, and must be regarded as a very suspicious sign in adults; but not so in young children, whose healthy, but yielding chests, may furnish a murmur, when acted upon by the pressure of the stethoscope, or that of expiration. In Dr. Bennett's case of patent foramen ovale, the patient had a temporary (inconstant) murmur, possessing the characters described by Da Costa, and also phthisis and dilated pulmonary artery—states in which you would expect "inconstant murmur." Dr. Markham's case was the subject of phthisis also.

I do not wish to claim any originality, but I am sure attention ought to be directed to the very dangerous conclusion of Da Costa in regard to young subjects, since a perfectly healthy patient may come to you of an early age, you listen at the second left cartilage and find a murmur (which may appear to be constant if you use too much pressure), having all the characters described by Da Costa—you diagnose phthisis, and commit a great error.

Gloucester-gardens, W.

THE SOURCE OF UREA.—Whence does this matter come? Where is it formed? M. Wurtz's researches lead him to this: That urea is found in the lymph and in the chyle, just as it is found in the blood. And from this the learned Professor concludes: That the lymphatics assist in the absorption of materials resulting from the metamorphoses which go on in the tissues, into which the radicles of absorbent vessels penetrate.

THE SURGICAL SOCIETY OF PARIS is accustomed to have an annual banquet. Once—on the occasion of the inundations of the Loire—it departed from its rule, and turned the subscriptions to charitable purposes. This year, the same benevolent feelings have taken hold of its members; and the wounded of the army of Italy will get the benefit of their charity.

THE LONDON AND PROVINCIAL
PRACTICE OF MEDICINE AND SURGERY.

REPORT ON MALIGNANT DISEASE OF
THE TESTIS.

In the following report we purpose to bring together all the examples of malignant disease of the testis which have been recorded in our pages during the last six years. In this way we hope to collect a body of facts from which important and trustworthy deductions may be made. As regards the age of the patient, the symptoms, duration, etc., of his disease, and the immediate result of the operation for its removal, almost all our cases will, we believe, be found to be complete. Unfortunately, however, we are not able in more than a very few instances to carry the history of the cases beyond a comparatively short time subsequent to the operation. On the important question as to how long life is usually prolonged after excision of the testis for medullary cancer, our series will, therefore, throw comparatively little light. We shall, however, carefully cite all such evidence as we possess on this point. In subsequent reports we purpose to investigate in a similar manner the other diseases of the gland.

KING'S COLLEGE HOSPITAL.

(Under the care of Mr. FERGUSSON and Mr. PARTRIDGE.)

Case 1.—A man, aged 40, who presented none of the usual indications of the malignant cachexia was admitted under the care of Mr. Partridge, in July 1854. His right testis had been enlarged for about a year; the disease was complicated by hydrocele; there was no enlargement of the cord, nor could any disease of the lymphatics be discovered. The gland was excised in the usual way. The patient sank under an attack of erysipelas on the eighth day. At the autopsy a large cancerous mass was found developed in the right lumbar glands.

Case 2.—A cachectic man, aged 51, under the care of Mr. Fergusson in King's College Hospital. The left testis was enlarged to the size of a small cocoa-nut. After excision, the disease proved, as expected, to be medullary cancer. Recovered.

Case 3.—A tolerably healthy-looking man, aged 43, under the care of Mr. Partridge. His right testis had been gradually enlarging for three years, and was the size of a closed fist, firm, and heavy. There was no cachexia, and the cord was not thickened. He complained only of a dull, dragging pain in the loins, and occasionally along the cord. Mr. Partridge extirpated the gland, which was afterwards found to consist of a mass of disease, in which scarcely any traces either of tubules or of the epididymis could be found. Under the microscope vast quantities of cells, some of them being compound, were seen interspersed with a few fine fibres. The patient did well for the first week after the operation, when the wound was attacked by erysipelas, which, however, under a stimulant treatment, passed off in about four days. He was subsequently extremely troubled with flatulence, which also, to some extent, had been the case prior to the operation. The belly, however, became tympanic, and his features assumed a sunken appearance. Death from exhaustion occurred on the eleventh day. At the autopsy, a mass of malignant disease, the size of an adult liver, was found in the lumbar region. It extended upwards as high as the pancreas, and downwards as low as the division of the aorta, while laterally it was in contact with both kidneys, those organs not being, however, themselves involved. The chief mass of the tumour was firm and hard, but on each side were portions of a soft and almost gelatinous structure. The tumour having been dissected, the aorta was found to pass almost through its centre, and was contracted, just above its division, to about one-third of its calibre. The ascending vena cava was pushed away to a considerable distance from the artery, and just below the renal vein was so much contracted as to be almost obliterated. (There had been no œdema of the lower extremities during life.) The ureters were natural in size, though they passed through the tumour.

Case 4.—Mr. Fergusson.—A man, aged 38, in fair health. Thirteen years before he had received a blow on the scrotum

from a cricket-ball, and eleven years later another from the same on the same part. It appeared that the enlargement of the testicle had been more particularly noticed after the second injury. It had enlarged to the size of an adult fist. The cord was healthy. After removal the disease proved to be the firm variety of medullary cancer. Recovered.

Case 5.—Mr. Fergusson.—A man, aged 59, from whose scrotum a large fibrous growth had been excised (by Mr. Fergusson) three years ago, the testis being then left. The disease had recurred, and was now the size of an infant's head, involving also the testis. Excision of the whole was performed. Recovered. The testis was lost in the mass, which appeared to be of fibroid nature.

ST. BARTHOLOMEW'S HOSPITAL.

(Under the care of Messrs. LAWRENCE, STANLEY, LLOYD, and PAGET.)

Case 6.—W. L., aged 34, was admitted, under the care of Mr. Lloyd, on January 8, 1852. The disease had commenced suddenly seven months before: health little affected. The left testicle was smooth, oval, etc., tumour size of a large fist. A harder piece at its upper part the size of a walnut; sense of deep fluctuation; not painful or tender; punctured four days before admission for hæmatocele, but only ten ounces of florid blood were obtained. No history of cancer in the family could be obtained. The inguinal glands on same side were slightly enlarged. After an exploratory examination, castration was performed on January 31. *Result.*—In a month he returned to his employment. (The healing of the wound was not easily accomplished.) He returned to the Hospital for "acute engorgement" of the inguinal glands, which, however, was easily removed. At the end of six months he was in excellent health, but the glands still continued suspiciously indurated.

Case 7.—Under care of Mr. Stanley: E. B., aged 38, admitted November 16, 1855. *History.*—The right testicle somewhat enlarged, and subject to aching pains for twenty years; but had enlarged rapidly, and become severely painful during the last six months. Six weeks ago it was punctured, and two ounces of creamy fluid were drawn off by a trocar. He next noticed two small lumps above the testis, which grew rapidly, and were attended with great pain. *Symptoms.*—Double the natural size, and extremely tender. The smaller tumours were rounded, of the size of a cherry, one anterior, and the other posterior, and were attached to the cord. The cord was swollen, but the glands in the groin were unaffected. *Operation.* November 25.—The testis, and as much of the cord as could be reached, were excised. *Result.*—After a tedious convalescence, attended with great local and constitutional disturbance, he left the Hospital, still in delicate health, on January 10. (a)

Case 8.—A man, aged 30, under the care of Mr. Skey, on account of great enlargement of the right testis. It was larger than a fist, firm, and heavy. The disease had commenced spontaneously six months ago, and no material pain had attended it. The cord was not affected, there was no evidence of disease of the lumbar glands, and the man was in pretty good health. The scrotum was reddened, and the testis adhered to it. Excision of the gland was performed in the usual way. The disease proved to be cystic, with medullary cancer, the cysts being small, and the greater portion of the mass consisting of cancerous material. (Microscope not used.) A portion of healthy testis structure was expanded in front of the tumour.

Case 9.—A healthy man, aged 37, was admitted into St. Bartholomew's Hospital, under the care of Mr. Skey, on account of great enlargement of the right testis, which had commenced two years before, and had been unaccompanied by pain. The gland was of stony hardness, and more than four times the size of the opposite one. The testis and lower third spermatic cord were excised on February 10th. The parts healed, and he was discharged from the Hospital in March, but was subsequently readmitted, and died of pleurisy. The diseased growth consisted of cartilage, as also did the numerous glandular and other secondary ones. (The full particulars of this singular case were read by Mr. Paget before the Medico-Chirurgical Society. See report in this Journal, page 634, June 23.)

(a) For details see *Medical Times and Gazette*, 1853, p. 524.

Case 10.—A man, aged 21, was admitted into St. Bartholomew's Hospital on account of what was at first supposed to be hydrocele. It was punctured, but only two ounces of bloody fluid escaped. He was in good bodily health, and had noticed the enlargement only six months. The gland was the size of a small fist. It was removed, and proved to be medullary cancer. The wound healed, but the disease returned in the cord before he left the Hospital.

GUY'S HOSPITAL.

(Under the care of Messrs. HILTON, COCK, and BIRKETT.)

Case 11.—A man, aged 26, was admitted under the care of Mr. Cock, on the 17th of April, 1858. He was pale and cachectic. His right testis had been gradually enlarging without pain for about a year, and was now about four inches in its longest diameter, being of oval shape but slightly flattened. The inguinal glands were somewhat enlarged, but the cord was healthy. On the 20th of April the gland was excised. On examination of the tumour no traces of testis structure could be found. The gland had entirely disappeared, and was replaced by cysts of various sizes, from a marble to a millet-seed. Some of the cysts contained clear serum, others a bloody fluid, while some were filled with a soft pulpy growth, presenting all the features of medullary cancer. Mr. Bryant, who made a careful examination of the specimen, considered it a good example of mixed medullary and cystic disease.

Case 12.—A man, aged 34, in fair health, under the care of Mr. Hilton. The testis was removed on account of malignant disease, which had existed ten months, the growth being about as large as a fist. The lower part of the cord was thickened, and in the operation the inguinal canal was laid open, and the cord divided high up. The mass of disease was found to have pushed the greater part of the gland structure to the posterior part, and had not destroyed it. The man recovered well.

Case 13.—A man, aged 31, apparently in good health, under the care of Mr. Hilton, in Guy's Hospital, on account of malignant disease of the left testicle, of thirteen months' standing. The cord was quite healthy, but there were glands in the groin which appeared larger than natural. The usual operation was performed. The bleeding from small vessels was, for a few minutes, very free, and a great many ligatures were required. The man subsequently recovered well. The gland presented after removal a good example of medullary cancer; it was as large as two fists.

Case 14.—A man, aged 37, in moderately good health, under the care of Mr. Cock, in Guy's Hospital, on account of great enlargement of the left testis. The disease had commenced spontaneously, and there was no history of hereditary tendency to cancer. The diagnosis was extremely difficult, as the man had no degree of cachexia, and the condition of the testis was much masked by effusion into the tunica vaginalis. The first part of the operation was exploratory. The fluid having been evacuated, the testis was found to be the seat of medullary cancer, and was accordingly excised. The cord was sound. The gland after removal presented an excellent specimen of soft cancer. The man recovered well.

Case 15.—A man, aged 56, under the care of Mr. Hilton, in Guy's Hospital, on account of malignant disease of the right testis complicated with hydrocele. He had the appearance of good health. The disease had existed a year and six months. The cord was not enlarged, and there were no indications of affection of the lumbar glands. After removal, the gland, which was larger than a fist, presented a remarkably good specimen of medullary cancer. The patient recovered well.

Case 16.—A labouring man, aged 28, apparently in good health, was admitted into Guy's Hospital, under the care of Mr. Cock, on account of great enlargement of the right testicle. He was of temperate habits, and knew of no injury to the part having occurred. The disease had existed four or five months, and for the past two weeks pain had been complained of. In some parts the gland, which was the size of a small fist, was of almost stony hardness; a small quantity of fluid occupied the tunica vaginalis. The cord was not enlarged, and a most careful examination of the chest and abdomen failed to discover any evidences of internal disease. There was a slightly enlarged gland above the right clavicle. Excision of the gland was performed on September 4th, and

after its removal it was found to be one mass of firm medullary cancer. The cord was quite sound. The man went on fairly afterwards, the wound healing; the gland over the clavicle, however, increasing rapidly in size. The wound being nearly closed, it was intended that he should be discharged, when suddenly rigors occurred, and he sank into a state of low fever. It now became evident a large growth was forming in the right lung; the gland also continued increasing. Death took place on October 16th. At the autopsy, the cord was found healthy until its lymphatics joined the lumbar glands, which latter were enlarged and cancerous. Malignant deposit was found in the right lung, and a large mass above the right clavicle.

METROPOLITAN FREE HOSPITAL.

(Under the care of Mr. HUTCHINSON.)

Case 17.—A little boy, aged two years and three months, was admitted, under Mr. Hutchinson's care, on account of malignant disease of the left testis, in March, 1857. Two of the boy's paternal aunts had died of scirrhus of the breast. The enlargement of the testis had first commenced about ten months before; the growth had been gradual, and almost painless. The tumour had attained the size of an adult fist. The cord not being thickened, and there being no indications of internal disease, excision was performed. The boy recovered well, and enjoyed good health for nearly eight months. At the end of that time symptoms of cancer of the lungs showed themselves and progressed very rapidly. Death took place on February 7, eleven months after the operation. At the autopsy both lungs were found most extensively infiltrated with medullary cancer. One small nodule, the size of a pea, was noticed in the liver, but with that exception there was no disease of the abdominal organs. No return of the disease had taken place either in the cord or the lumbar lymphatics. It was an interesting fact as to the hereditary transmission doctrine, that two paternal aunts of the patient died of cancer of the breast.

THE MARYLEBONE INFIRMARY.

(Under the care of Mr. THOMPSON.)

Case 18.—A man aged 35, under the care of Mr. Henry Thompson in Marylebone Infirmary, on account of enlargement of the testicle of some months' duration. After excision, the disease was found to consist of a combination of cystic, cartilaginous and cancerous deposits. The gland was the size of a small fist. The man recovered quickly.

THE WESTMINSTER HOSPITAL.

(Under the care of Mr. BROOKE.)

Case 19.—A man, aged 31, under the care of Mr. Brooke, in the Westminster Hospital, on account of medullary cancer of the testis. The enlargement had commenced a year before, and the scrotum had been ulcerated for four months; the cord was thickened. The testis, the diseased integument, and lower part of the cord were removed. Recovered.

THE CHARING-CROSS HOSPITAL.

(Under the care of Mr. CANTON.)

Case 20.—A boy, aged 9, under the care of Mr. Canton, in the Charing-cross Hospital, on account of cancer of the right testis. He was a florid, healthy-looking boy, but of thin skin and bright glistening eyes. There was no history of hereditary predisposition, and the disease was referred to a kick, which had been received some time before. The tumour was as large as a fist, and presented, after removal, the usual features of soft cancer. The cord was not perceptibly diseased. The wound healed kindly, and he soon left the Hospital. Within a month of the operation, however, the cord began to enlarge, and there were indications of disease of the lumbar glands. The disease in both these regions rapidly progressed, but no ulceration occurred. The child died asthenic, and worn down to a skeleton, rather more than three months after the operation. The post-mortem discovered an enormous growth of medullary cancer from the lumbar glands of the same side as the original disease, by which the viscera had been much displaced. The cord was also the seat of cancerous infiltration.

ST. THOMAS'S HOSPITAL.

(Under the care of Dr. BARKER, Mr. MACKMURDO, Mr. SIMON, and Mr. SOLLY.)

Case 21.—The following case is of especial interest as an example of malignant disease of the testis running its course without interference by operation. Its subject, a warehouseman, aged 26, was admitted under the care of Dr. Barker, February, 1854, on account of a large tumour on the left side of the abdomen. On examination it was discovered that his left testis was also greatly enlarged. His aspect was pale and sallow, and he gave the history that he had very rapidly emaciated and lost colour and strength. He had, he said, enjoyed good health until about three months previously. The enlargement of the testis was the first symptom that he had noticed; but aching in the loins followed shortly after. He soon noticed a hardish tumour growing in the abdomen. Whilst this latter grew rapidly, the testis almost ceased to enlarge. At the date of admission a large mass, deeply placed in the left lateral region of the abdomen, was easily felt. The testis was about the size of a fist, and the cord was at least as thick as a fore-finger. The man remained in the Hospital for two months before his death, during which time the abdominal tumour grew so rapidly as to distend the integuments in all parts. Death occurred exactly four months from the date of the enlargement of the testis having been first noticed. Unfortunately no post-mortem examination was obtained, but there could be no doubt that the primary disease was soft cancer of the testis, rapidly followed by like affection of the lumbar glands. (a)

Case 22.—A man, in fair health, aged about 50, under the care of Mr. Mackmurdo, on account of malignant disease of the testicle and cord, following a blow. The gland was excised, and he recovered well. The disease proved to be medullary cancer.

Case 23.—A man, aged 38, under the care of Mr. Solly, on account of medullary disease of the testicle. He appeared in good health, and the disease was believed to be limited to the gland. Excision was performed in the usual way, and a good recovery followed. The organ after removal presented a good specimen of the disease.

Case 24.—A sallow, cachectic man, aged 37, under the care of Mr. Simon, on account of enlargement of the right testis to the size of an orange. The disease had existed fifteen months, and had the characters of soft cancer. Excision was performed, and the disease was found to be medullary cancer complicated with cholesteatoma. Recovered.

THE LONDON HOSPITAL.

(Under the care of Mr. LUKE.)

Case 25.—A testis affected with medullary cancer was removed from a child, aged 4 years, under the care of Mr. Luke. The patient was a stout, but very pale child; there was no indication of affection of the glandular system, or of the structure composing the cord. Some inflammation of the scrotum and about the inguinal canal followed, but the patient ultimately recovered.

ST. GEORGE'S HOSPITAL.

(Under the care of Mr. CUTLER.)

Case 26.—A man of middle age, under the care of Mr. Cutler, in St. George's Hospital. The testis was excised on account of encephaloid disease. Death occurred on the seventh day. The autopsy showed evidences of peritonitis, and also of encephaloid disease of the lumbar glands.

UNIVERSITY COLLEGE HOSPITAL.

(Under the care of Mr. QUAIN and Mr. ERICHSEN.)

Case 27.—J. H., aged 16, was admitted, under the care of Mr. Quain. The duration of the disease was eight months. Tumour, 8½ inches in length. Cord thickened. Mr. Quain removed the testis and the diseased portion of the cord as high as the inguinal canal. *Result.*—Abdominal pain, etc. followed the operation, and death took place a fortnight later. The autopsy revealed a large mass of medullary cancer in the right lumbar region. (For details see *Medical Times and Gazette*, 1853, page 61.)

(a) At page 653 of this Journal, for June 25, is another example of malignant disease of the testis not removed by operation. The growth had commenced four months before death, and had attained the size of a cocoa-nut. The case is recorded by Mr. Kidd, of Blofield, in whose practice it occurred. The patient's age was 30 and he is stated to have died of phthisis.

VARIOUS PROVINCIAL HOSPITALS.

Case 28.—The Bristol General Hospital: Mr. Lang.—A man was admitted, under the care of Mr. Lang, into the Bristol General Hospital, with an enlargement of the left testis, of doubtful nature. The disease had existed for five months, and was gradually progressing. An incision having been made, a large quantity of blood was discharged with much diminution of the swelling, but as, on microscopic examination, compound cells were detected in the fluid, extirpation of the entire gland was performed. The disease proved to be medullary cancer. The man recovered; but, at the time of the report, one edge of the wound had assumed an appearance suspicious of return of the disease.

Case 29.—The Dorset County Infirmary: Mr. Sayle.—A man, aged 43, of very healthy appearance, was admitted under the care of Mr. Sayle in the Dorset County Infirmary, on account of diseased testis. The gland was of the size of an infant's head, of oval form, smooth, soft, and elastic. There had been no pain in the back, nor was there any perceptible enlargement of the inguinal glands. He had first noticed an enlargement seven years ago, but had paid no attention to it until lately, when it had rapidly increased. There had been no pain, and its size and weight were its only inconveniences. An exploring-needle was employed, and numerous compound cells of rounded form, and about three times the size of pus-cells, were found in the fluid so obtained. Excision of the gland was performed. The cord was found healthy. The wound healed, and the man was discharged well. The disease proved to be medullary cancer.

Case 30.—The Durham Infirmary: Mr. Green.—A sallow, cachectic man, aged 21, under the care of Mr. Green, in the Durham Hospital, on account of enlargement of the right testis, which had first commenced eighteen months ago. The gland was excised in the usual manner, and, on examination, the diagnosis of medullary cancer was found to be correct. The man recovered well. This patient again came under observation three months after the operation. The cicatrix of the wound was then found of a gristly hardness, and there was also a tumour in the abdomen, about the region of the umbilicus. He suffered much from pain and sickness, and there could be little doubt that a reproduction of the disease in the lumbar glands had taken place, and would before long cause death.

Case 31.—The Bradford Hospital: Mr. Poppleton.—A man, aged 25, was admitted under the care of Mr. Poppleton, into the Bradford Hospital. Three years ago he had received a blow over the left testis which had caused him pain for a few days, but of which he subsequently took no notice. About five months afterwards he discovered that it was larger, harder, and heavier than the other, but it was quite painless. From that time it continued steadily increasing in size, until at the time of admission it had become as large as a turkey's egg. It was of stony hardness, and felt very heavy. It did not adhere to the scrotum, nor had the spermatic cord become involved. Excision was performed, and the wound healed rapidly. Microscopic examination discovered the appearances characteristic of cancer.

Case 32.—The Leeds Infirmary: Mr. Hey.—A healthy-looking man, aged 45, under the care of Mr. Hey, suffering from encephaloid cancer of the testis. Mr. Hey removed the testis in the usual manner. The patient died well until within two days of his death, which resulted from acute peritonitis three weeks after the operation.

Case 33.—The Sheffield Hospital.—A man, aged 25, under the care of Mr. Jackson. His right testis had been enlarging for six months, after an injury received from the pommel of his saddle. It was of large size, and evidently the seat of malignant disease. Mr. Jackson removed it. The man recovered well.

Case 34.—The Derby Infirmary: Mr. Johnson.—A man, aged 26, was admitted into the Derby Infirmary, the subject of medullary cancer of the right testis, under the care of Mr. Johnson. Excision. Peritonitis occurred on the third day, but it passed off, and the man recovered.

Case 35.—The West Norfolk Hospital: Mr. Kendall.—A man, aged 34, was admitted on September 13, the left testis being enlarged to the size of a hen's egg. The disease had existed six months, and the gland was irregular in shape, and very firm. There had been much pain in it. The testis

was removed, and showed under the microscope a "fibrous structure containing compound cells." Recovered.

Case 36.—The West Norfolk Hospital: Mr. Kendall.—A labourer, aged 56, who had enjoyed good health until about six months ago, when his right testis began to enlarge, and his strength suffered. The same testicle had been enlarged eight years before, but did not then cause him any trouble. On admission the testis was as large as two fists, tense, elastic, of irregular shape, and very painful. On June 11 excision was performed. Erysipelas of the scrotum followed, and extended to the groin and thigh. Much sloughing of the skin in the groin resulted. He was recovering from this when, about three weeks after the operation, a fungous bleeding growth appeared from the extremity of the cord. This rapidly enlarged, and profuse bleedings followed. He sank from exhaustion on September 17, three months after the operation.

We defer to next week our summary of this series, and comments thereon.

No. 353.—THE AGE OF MAN.

M. Flourens, once endeavoured to calculate how long a man ought to live. And he made his reckoning by determining the duration of life in some of the lower animals, and finding out how long it took for their skeleton to arrive at its perfect development. He thus satisfied himself that man was a centenarian. But we know, alas! that in all the civilised countries of Europe the mean period of life does not exceed 35 or 40 years; that among the lower classes it may be as low as 30, and that among the upper classes it rarely exceeds 60 years. M. Hæser, a German professor, has, however, discovered a little Oasis of the Blest, where the population's mean age reaches very near to the figure of M. Flourens. He relates, that on one of the little hills which surround the Gulf of Naples, there exists a convent, called of the Cameldules, which is celebrated through the world for its picturesque position. The business of the pious inhabitants of it consists wholly in prayer and silence. Their food is of the simplest, a purely vegetable diet—

"Their food the fruits, their drink the crystal well."

But a diet sufficient, says the learned professor, to repair the losses occasioned by labours so little fatiguing. "My guide," he relates, "who looked like one of 40, was 70 years old; and he was the youngest of the community. He assured me, that the death of a Cameldule before the age of 90 was an unheard-of event, and that a considerable number of the religious exceeded 100 years of age." M. Hæser also makes out that men of genius, at all events, lived longer in ancient than in modern days. The age of Pericles in this respect beats all others. At Athens, the majority of citizens of that day attained the age of 80. Hippocrates was a specimen of this class. Xenophon and Sophocles reached to 90. Epicharmus to 97. Thales and Solon to 100, and Gorgias and Leontium to 108.—*Clinique Européenne.*

No. 354.—REMEDY FOR JAUNDICE.

SIR,—There is nothing new in the "Remedy for Jaundice" (Notes and Queries, No. 347). Vanden Bossche, in his "Hist. Med. Animal," p. 414, informs us, on the authority of various Physicians, and, among others, Felix Platerus, the Professor of Medicine at Basle, at the end of the sixteenth century, that

"if eleven lice (or thereabout) be eaten by persons in the jaundice, they will be of benefit to them," and that "the certainty of the remedy is proved by experience." There is luck in odd numbers, and "nine" is but the thereabout of "eleven." If any one feels interested as to the best mode of procuring the remedy, let him consult the plate in Vanden Bossche's work.

O. A. M.

P.S.—Is there anything more disgusting in this than that (as related by the same author) bugs "*vivis in penis organum immissis*," should be used "*ad ciendam urinam*;" not dead and powdered, as Dioscorides recommends?

No. 355.—PINEL AND COUTHON.

When Pinel undertook the management of Bicêtre, the Revolution was at its height. The notorious Couthon preceded over the dreaded *Commune* of Paris, and when Pinel came to him to obtain permission to remove the chains from the madmen, went himself the next day to the Asylum, fearing lest in such an act there should be some hidden attempt against the democratic Government. When he saw the madmen, he turned to Pinel and said: "Are you not mad yourself to wish to deliver these *bêtes féroces* from their chains?" "No," answered Pinel, "for I am certain that their chains make these wretched people thus violent." "Do as you like," said Couthon. From this time the good work commenced. The following day he removed the chains from fifty, and from thirty more a few days afterwards. The Academy of Medicine has adorned one of its rooms with a picture of this scene of humanity. Shortly after this we are told that Pinel was seized by some of the ruffians of the day, under the pretext of being an aristocrat, and hurried off "*à la lanterne*;" and that his life was saved by an old soldier, one Chevingé, whom he had delivered from his chains in Bicêtre, and who had become his servant.

No. 356.—MONTAIGNE ON MINERAL WATERS.

"I have seen, in my travels, almost all the famous baths of Christian countries, and for some years have made use of them, esteeming the bath, in general, to be salubrious. I have never, however, seen any extraordinary and miraculous effects there; but have found all the tales about such operations in these places ill-founded, although they may be much credited there, people readily swallowing what they wish to believe (*comme le monde va se pipant aysement de ce qu'il desire*). Yet I have rarely seen people who have been injured by the waters, and cannot deny that they excite the appetite, aid digestion, and give one new spirits (*nouvelle alacrité*), provided the health is not broken down seriously; in such case, I advise no one to visit the waters. The waters are not able to restore a heavy ruin; they can support a slight decline of health, or provide against the threatenings of some alteration of it. Whoever does not take a light heart there to enjoy the pleasures of the society of the promenades, and of the exercise to which the beauty of the country around the baths usually invite him, will most assuredly lose the best part and the most certain of their influence." [Could the most scientific and experienced of modern Physicians have more truly hit off the right value of these watering-places? It is curious to note how acute genius separates the false from the true, and traces up the effects produced to their true causes.]

No. 357.—DR. BEDDOES' IATROLOGIA.

1. The philanthropic doctor, having two varieties, A and C, the shy and the renegade; 2. The bullying doctor, with Radcliffe at their head; 3. The Bacchanalian doctor; 4. The solemn doctor; 5. The club-hunting doctor; 6. The burr doctor, *centaurea calcitrapa*; 7. The wheedling doctor, with the variety of the Adonis wheedling doctor; 8. The case-coining doctor; 9. The good-sort-of-man doctor, with variety, and the gossiping good-sort-of-man doctor, who "fetches and carries scandal;" 10. The sectarian doctor variety, and the inspired sectarian doctor.

Beddoes concludes this decade of Doctors with *notandum est in toto hoc genere naturam mirabiles edere lusos*. This is applicable to all the species, there being mules and hybrids, and occasionally monsters magnificent and dreadful like Paracelsus.—*Horæ Subseciore.*

SATURDAY, SEPTEMBER 10.

THE SMETHURST CASE.

WE have already (page 217) placed before our readers the conclusions at which we arrived after a careful study of this remarkable case. As this conclusion has been the subject of some misrepresentation, we repeat it here—"The balance of probabilities was against him, but there is a *possibility* that he may be innocent. Innocent men have been hanged upon circumstantial evidence as strong as that which led to Smethurst's sentence. The very possibility of such a judicial murder is so dreadful, that, while retaining the conviction of the guilt of the prisoner, forced on us by a consideration of the whole circumstances of the case, and without a particle of sympathy for him personally, we should gladly strengthen by any means in our power the petition to Government not to carry out the irrevocable sentence of DEATH."

Still believing this to be the most correct view of the case—the view adopted by the vast majority of those who regard the case as a whole, in the dispassionate spirit of scientific men—we congratulate the Profession that the prisoner has not been hanged. However firmly convinced any of us may be that the evidence is in favour of his guilt, the most dogmatic must admit the possibility of his innocence.

In another column our readers will find an admirable letter from Dr. Wilks, which fills up a link wanting in the Medical history of the case as hitherto reported. The morbid appearances observed in the intestinal canal of Miss Bankes are there carefully described, and their true import, as we think, accurately defined.

We have little to add to the summary of the comments on the evidence we published last week, except the following remarkable case related by Dr. Quain, and an account by Dr. Taylor of his discovery of the fallacy of Reinsch's process.

Dr. Quain says,—

"In the autumn of 1857 a lady, aged 36, who had been married some ten years without any indication of having a family, returned with her husband from the country to their town house complaining of illness. She said she had a bilious attack, was sick after all food, and that there was a tendency to relaxed bowels. I treated her in the usual way, with very little success, and after two or three weeks a question arose as to the probability of her symptoms being connected with pregnancy. These symptoms went on increasing in severity, and the fact of pregnancy became established.

"Another Physician was joined with me in attendance, but our treatment was still unsuccessful; the lady suffered from more or less constant sickness, more or less constant diarrhoea with much pain in the throat and in various parts of the abdomen. Two other Physicians were subsequently joined in consultation. A Medical gentleman was placed as resident in the house. Everything that Professional skill combined with the utmost watchfulness and attention could do was done in vain. She became weaker and weaker, and gradually sank exhausted within an hour of giving premature birth to a child.

"During the progress of the case a question arose as to the

propriety of bringing on premature delivery, but the idea was given up for reasons which it is unnecessary to mention here. I should state that so markedly did the symptoms resemble irritant poisoning, that I mentioned this impression to a friend of the lady, and, even thinking it possible that in some accidental way or other poison was being taken, I had the vomited matter chemically examined. I need not say that no poison was found."

Dr. Taylor says, writing to a contemporary:—

"The fact that arsenic was contained in the copper gauze did not arise from any suspicion or suggestion from Mr. Brande or any other person. After the closing of the inquest on the 31st of May, Dr. Odling and I tested various samples of chlorate of potash and copper, with the view of determining whether they contained arsenic as an impurity. In the course of these experiments, it was conclusively proved, on or about the 7th of June, to the satisfaction of both of us, that the copper gauze which had been used in our analysis contained arsenic. A report to this effect was drawn up and placed in the hands of the solicitor for the prosecution. The fact was stated to the grand jury on the 14th of June, so that the error might not prejudice the prisoner. The residuary liquid in the bottle No. 21 was sealed up. In re-testing this liquid, it was deemed advisable that a chemist, eminent for his integrity and knowledge, should be present to take a part in the experiments and witness the results. Mr. Brande, who had not previously been consulted in this case, was requested by the solicitor for the prosecution to attend at the chemical laboratory, Guy's Hospital, for this purpose. The liquid of No. 21 was re-examined by Mr. Brande and ourselves on the 28th of June—i. e. three weeks after we had discovered the presence of arsenic in the copper. He did not express any suspicion to us, but we first communicated the fact to him, and up to that time he, like ourselves, had no suspicion that arsenic was contained in the finely-woven copper gauze.

"You say that no arsenic or antimony was discovered in any of the tissues of the body of Miss Bankes. This is an error, and it has had a wide circulation through the press. Dr. Odling and I stated in our evidence that antimony was distinctly found in one of the kidneys. We also discovered it in notable quantity in the jejunum, ileum, and cæcum. In addition to these results, there were traces of the metal in the blood."

It is so plain from this statement that Dr. Taylor has acted in this case the part of an upright, honourable, scientific man, who, detecting his own error, at once made it known in the most candid spirit, that it is quite unnecessary for us to defend him from the absurd charges which have been made or insinuated against him,—but agreeing very fully with some remarks which have been made in a leading article in the *Weekly Chronicle*, we transcribe them as an act of justice to one who has been assailed in a very discreditable manner:—

"Certain newspapers and certain Medical men have taken a prejudice against Professor Taylor, and the present agitation does not arise for an instant from any sympathy for Smethurst, but is simply a pure faction fight. Why, it was well known months ago which side certain newspapers would take. From the moment it was announced that Professor Taylor was employed on behalf of the Crown, the course which certain papers would take was as obvious as possible. It is a matter of deep regret that it should be so; but that it is so 'nobody can deny.' Now, what has Professor Taylor done throughout his career to merit this onslaught on his professional position? He is one of the most careful and skilful analysts in the kingdom; and though every effort which the skill of the counsel for the defence, and professional rivalry could do to damage his evidence has been done, it has been of little avail. As to the mistake in the present case, it simply proves the honesty of the man. The moment the mistake was discovered—and, be it remembered, he would never have discovered it had he not been a most careful analyst—he communicated the fact immediately to the counsel for the prisoner. He thus made himself 'food for powder;' and yet it is a man with a fine sense of honour like this, who is branded by a portion of the press as one who would send a fellow-creature to the gallows rather than acknowledge himself to be in error. There is one thing, however, which the Smethurst trial discloses, and it is

this—given an accomplished poisoner as a prisoner, and Dr. Taylor as a witness for the prosecution, and you can lay your finger at once upon certain London papers who will come forward forthwith and declare that the man is innocent.”

LAWYERS PRACTISING MEDICINE WITHOUT A LICENCE IN SCOTLAND.

THE Scotch and English Law of Lunacy differs somewhat, although a couple of years ago they were to a certain extent assimilated by the extension of some of the provisions of the English Law to Scotland. In order to confine a lunatic in Scotland, certificates are required from two Medical men, who must visit the patient separately, and who must give in their report the reasons on which their opinion is founded. The petition of the patient's relatives, backed by these certificates, then goes before the Sheriff or local magistrate of the county, who, formerly, if the documents were correct in form, at once granted a warrant for the patient's detention. In such a course of proceeding of course the responsibility lay with the Medical men and the friends of the patient, and accordingly actions have been brought against them repeatedly in the Scotch Courts for alleged erroneous commitment of lunatics to asylums.

We gather, however, from a passage in the report of the Royal Edinburgh Lunatic Asylum for 1858, just published, that this state of matters no longer exists,—that the *legal* education of a sheriff is held to qualify him better for deciding on so delicate a matter as the diagnosis of insanity, than the *Medical* education of a Physician; that the Lawyer, and not the Doctor, is the proper judge of the treatment advisable in cases of insanity, and that when the Medical Attendant prescribes the quiet, the seclusion, and the moral restraint of an asylum, the legal Justice Shallow may step in and countermand his orders. Is there no Registration Association in Scotland to prosecute such cases of unlicensed practice? On the whole, however, we are disposed to congratulate the Medical Profession on this invasion of its rights. If lawyers are willing to take upon themselves so delicate and painful a duty, by all means let them do so, *if they accept at the same time the responsibilities appertaining to it.*

We have often said to Medical friends who were annoyed with actions brought, or threatened, against them for alleged erroneous detention of lunatics, that, sooner or later, Medical men must, unless protected, refuse to sign certificates of lunacy. The difficulty, however, always was, How was the matter to be managed without us? This Scotch pundit has cut the knot. Let the sheriffs, who get good salaries, be the responsible parties; let them take evidence in the form of certificate or otherwise; let them sign the warrant for confinement on their own judgment, the Medical men who grant the certificates being merely regarded as witnesses.

We had almost omitted to explain, that by the exertions of the College of Physicians of Edinburgh, a clause was introduced into the Lunacy Act while passing through Parliament, allowing a patient to be detained twenty-four hours in an asylum without the necessary forms, in cases of extreme urgency, and it seems from the passage in the Report, which we conclude by quoting, that the case in question did appear urgent, and was therefore so detained until released by the refusal of the sheriffs to sign the warrant.

“The first case in this table, that of a female, who was removed within twenty-four hours after her admission, was one admitted on a Certificate of *Emergency*, under a wise provision of the new statute, but whose friends, notwithstanding the emergency of the case, were unable to procure a warrant from the Sheriff. The warrant was refused, because the facts upon which the Medical men founded their opinion of the lady's insanity, and which now required to be specified in the certificates, were not such, as in the opinion of the Sheriff, amounted to proofs of insanity.”—*Report*, page 20.

THE WEEK.

WE have been favoured with the perusal of a letter directed to a most respectable Medical Practitioner in this country, and purporting to come from an agent for conferring diplomas in Medicine in the United States. We are scarcely able to comprehend the exact meaning of this document; but as far as we can understand it, the writer offers, in consideration of the sum of £5, transmitted to the “Venerable the Dean” of an American University, to send back a Diploma, conferring the degree of Doctor of Medicine. The address of this “venerable” gentleman is “Dr. Bellamy, Clarksville, Cayuga County, New York State.” The supposed candidate for Medical honours is further recommended to get a Latin thesis written for him by a person in England (whose name is mentioned), as a preliminary to the conferring of the degree, but it is intimated that this classical “coaching” will cost somewhere about £70. We cannot dispossess ourselves of the belief that the whole affair is a hoax, or that some person in America is attempting to practise a delusion upon his “cousins” in the mother country. It cannot be credited that any University in the United States would degrade itself by selling its Diplomas in Medicine for the paltry sum of £5 each; and we are assured that the gentleman to whom the letter to which we have referred was addressed, knows nothing whatever of his Transatlantic correspondent, and entirely repudiates the offer of a degree on the terms proposed. We may further observe, for the benefit of those who are as yet ignorant of the operations of the New Medical Act, that any foreign degree, conferred without examination, is utterly worthless in this country; and if any persons should be hereafter foolish enough to invest their cash in any such venture, they will merely afford a verification of the old adage, that “a fool and his money are soon parted.” We might comment further upon this matter, except that we believe, as we have just intimated, that the whole affair is a hoax, although the parties from whom we have received the information are of acknowledged probity and position in the Profession, and are justly indignant at the scandalous sale of diplomas which is inferred (though we believe without foundation) to be carried on across the Atlantic.

The condition of lunatics in Jamaica has been already alluded to in this Journal. A full demi-authoritative statement lately made on the subject in the *Times*, cannot fail to excite attention. We trust that the numerous eagerly-minded philanthropists who have on many occasions lately exhibited such great desire to see these unfortunates duly dealt with in this country, will now extend their sympathies across the Atlantic, and take a view of the cells of the Kingston Lunatic Asylum, and the condition of their inhabitants. Surely, to the eye of reason, the lunatic in Jamaica—our own countryman—demands as much consideration as if he were here in England under our immediate inspection. But if the accounts alluded to be true, his treatment there is such as would excite the deepest indignation if adopted here. There is, it appears, in Jamaica, but one institution for the treatment of insane persons. It is situated at Kingston, and forms part of the public Hospital. Fifty years ago, it seems, 24 cells were provided for the insane of the island. These cells were 13 feet by 10 feet in area; and into these have been habitually crammed 120 or more patients. Each occupant gets between 214 to 497 cubic feet of air. Only a certain number have beds; the rest lie on inclined wooden shelves. During the night they are virtually unwatched. Such a condition of the insane as is here described can hardly be credited as possible in a settlement of the British Crown. It is a disgrace and blot upon the nation. So long ago as 1843 the evils were admitted and recognised in the island, and after

an elaborate enquiry, money was granted by the Legislature, and in 1847 a new edifice was begun. But in 1851, such is the native apathy of the islanders, though nearly £21,000 had been expended, and £10,000 worth of convict labour besides, not one-third of the building was completed. And now the local authorities took fright at the magnitude of the undertaking; they stayed their hands, and as this report says, "handed over the work so nearly completed to the owls and bats;" so that the insane of the island are still lodged in their old cells of fifty years ago. In England such a state of things—so discreditable to our civilization—could not exist; and for the reason, that we have a Lunacy Commission, exercising supervision and control. Why should not the benefits of such an institution be extended to our Colonies? The Jamaica cells referred to are, it seems, closely connected with the General Hospital; and it is therefore evident that the condition of the Asylum must be well known to the Medical Officers of the Hospital. We cannot doubt that these gentlemen have remonstrated against the abuses; but we well know how powerless men in their position are to act against the dead weight of unwilling men in power. Surely this case should be one for the Executive to cope with, and at once. The time is gone by when governors are sent to our islands for the sake merely of recruiting their own broken fortunes.

It is to be feared that the existence of Burial Clubs among the poor is, indirectly, one of the fertile sources of our increased infant mortality. The subject has lately been prominently brought into notice in a work by Mr. Joseph Kay, on the "Social Condition and Education of the People," especially in a chapter entitled, "The Frightful Extent of Infanticide among our Poor." A collector of a Burial Society states to Mr. Kay, "the poor people have often told me that they were unable to pay at the time of my visit, but when a certain member of the family died—generally a child—they would be able to pay." The collector of a Burial Society in Manchester states strong grounds for believing that it has become a practice to neglect children for the sake of the money allowed at their death. A lady stated that a young woman, whose service she required as wet-nurse, having a child ill, she offered to send her own Medical friend to see it, but the reply was, "Oh! never mind! it's in two Burial Clubs." It also appears, on the authority of a Burial Club official, "that hired nurses speculate on the lives of infants committed to their care, by entering them in Burial Clubs;" and that two young women proposed to enter a child into his club, and to pay the weekly premium alternately: upon inquiring into the relationship existing between the two young women and the child, it was ascertained that *the infant was placed at nurse with the mother of one of the young women!* Comment on these statements is unnecessary, as the facts speak but too plainly for themselves.

We trust that the horrible death of the servant-girl, who was destroyed last week by Dr. Pownall, will tend to open the eyes of the public on the subject of insanity. No one who has read the case can doubt for a moment that the poor girl had her throat cut by a lunatic. It was proved at the inquest that Dr. Pownall had only been recently discharged cured from a Lunatic Asylum; and it was equally clearly shown that the deed was objectless, and the act of an unreasoning creature. Although committed for wilful murder, there is no earthly doubt but that the Doctor will be proved a lunatic. When brought before the Coroner, and questioned as to the cause of his cutting the girl's throat, he answered:—"I cannot tell you; I unfortunately did it. I can hardly assign any motive. I felt I was bound to do something, and I could not resist it." The truth is, that if the persecution

which gentlemen engaged in the department of Lunacy have been lately subjected to is persevered in, we shall have many more sad tales of this kind to relate. It should be remembered (to show the ignorance, on this subject, of the highest, so-called authorities) that only a few years ago, one of the most renowned judges on the bench, gave it out in Westminster Hall as his solemn opinion that no man ought to be confined as a lunatic who had not done acts of violence such as rendered him dangerous to society. The noble Lord issued this wild statement in face of the fact, that if it were practically carried out, the Lunatic Asylums of England could be at once emptied of three-fourths of their inhabitants! Let us hope that the above sad lesson may not be lost.

The Apothecaries' Hall of Dublin has published a "Reply" to the statement of the King and Queen's College of Physicians in Ireland, relative to the right on the part of the Hall to grant licences to practise Medicine. It will be recollected that this right has been questioned by the Irish College of Physicians, and that this view of the College has been confirmed by a late decision of the Medical Council assembled in London. The Dublin Apothecaries' Company now maintain that they do possess the power of granting licences to practise Medicine, and they set forth the reasons on which they found their argument. They declare that from time immemorial, the Irish Apothecaries have practised Medicine, and have been the ordinary Medical attendants on families; that several Irish enactments can be adduced to prove that at a very early period the Apothecary in Ireland was a fully-recognised Medical Practitioner, and entitled by law to attend the sick in Hospitals and Prisons; that the education of the Irish Apothecary is commensurate with the duties which he performs as a Medical Practitioner; that the enactments which passed subsequently to the institution of the Hall all verify the validity of the licence granted by the Company as a qualification to practise Medicine; and that the recent Medical Act permits the registration of Licentiates of the Dublin Hall, and confers upon them all the professional rights and privileges which are enjoyed by persons who are so registered. In a note appended to the "Reply," the Dublin Hall enters into a detailed contradiction of the various statements and arguments put forward by the Irish College of Physicians, and exhibits in a tabular form the requirements as to preliminary and Professional education demanded respectively by the Dublin Apothecaries' Hall and the Irish College of Physicians; by which comparison it appears that the curriculum required by these two bodies is pretty much the same. The Dublin Hall concludes by disputing the right of the Medical Council to decide the question between the College and Hall, and declares that the matter is still in abeyance.

A daily contemporary has lately exclaimed against the frequent application of the cat-o'-nine tails to the backs of her Majesty's soldiers, as now practised at Woolwich. We heartily join in every crusade against that instrument of degradation and torture, which has most certainly, if looked at only in the light of a correcting agent, done infinitely more harm than ever it has effected of good. It is an old saying of a wise head, that a man who has once been flogged will never make a good soldier. The slur and the scars on his back will both stick to him for life. In this modern day punishments involving mutilation and torture are repugnant to the moral sense of the community; and therefore we would also cry out against that other remnant of a brutal mediæval penal code—the branding of the soldier. Putting a lasting mark of degradation upon a man, whose crime does not deserve more than temporary punishment, is committing an act

directly opposed to all our advanced ideas of reformation mingled with punishment. It is manifest and certain, that a man thus degraded, however well inclined he may be to become a better man, has a weight to struggle against, which he can hardly ever overcome. The mark D. upon his shoulders, is the old man of the mountain, which sinks him down and prevents him emerging from the old slough of his former ill ways. According to the Army regulations it is the duty of the Medical officer to witness this degrading act of punishment. The very fact of such a duty being delegated to a man in the position of Surgeon to a regiment, gives us an idea of the kind of mind and spirit which pervaded the councils of those who originally established the fixing of this mark of infamy on a man's back.

PROGRESS OF MEDICAL SCIENCE.

Selections from Foreign Journals.

ON THE CÆSAREAN SECTION.

By M. BOURGEOIS.

In this paper, the author, a provincial Practitioner, adduces a great number of cases of success which have been recorded in the various periodicals since the summary published by Baudelocque, in 1798. In Baudelocque's memoir there were ninety-one operations, in which thirty-seven were successful, and now M. Bourgeois has collected references to about a hundred successful cases, the operation in several instances having been repeated more than once on the same woman. He is a strong advocate for the operation, adopting the theological views on the practice of craniotomy prevalent at the Sorbonne, and recently revived in our own country. He observes that the operation never having succeeding in the Paris Hospitals, in the case of its performance being required, the patient should at once be transported to some distance from the capital. Indeed, it should never be performed in a Hospital at all, nor should any of the body-linen or bed-linen, etc. of a Hospital accompany the patient. The operation should not be delayed beyond the period of the dilatation of the os uteri, allowing the woman to exhaust her strength by useless efforts, while at the same time the life of the infant is endangered. It should be commenced if possible before the rupture of the membranes, as the incision made during the distended state of the uterus will become smaller during the retraction of the organ after delivery. The incision should not, indeed, be made needlessly long, and one of thirteen centimetres will usually suffice for the extraction of the fœtus. The simpler the dressing is the better, and sutures should be specially avoided, as they cause great suffering and irritation, and either prevent the development of the abdomen, or give rise to mischief by becoming torn away. A simple digitated bandage, intercrossed over compresses placed on each side of the incision, answered every purpose in a case which occurred to the author. A few drops of tincture of arnica given every few hours is very useful in the prevention of after consequences; while traumatic fever should be combated with the tincture of aconite. In forty-five fatal cases, the following were the causes of the fatal issue:—In 5, the immediate consequences of the operation, as debility and exhaustion; in 2, convulsions; in 9, hæmorrhage; in 16, metro-peritonitis; in 3, effusion into the abdomen; in 2, colliquative diarrhœa; and in 1 gangrene and typhoid symptoms. The following are the conclusions of the memoir:—1. The accoucheur must endeavour to save the life of the infant as well as that of the mother. Morality prohibits foeticide, religion condemns it, social economy cannot accept it, and science should not inculcate it. 2. When the pelvis is not less than 7½ centimetres, or more than 8½, in diameter, premature delivery by means of the uterine douche should, if possible, be had recourse to. 3. When the diameter is less than 7 centimetres and the child is living, the Cæsarean operation must be performed. 4. The operation is the more likely to succeed when the patient is placed in good hygienic conditions, too long delay has not taken place, the incision does not extend beyond 13 centimetres, sutures are not employed, and when arnica is

given as a prophylactic, and aconite as an antiphlogistic.—*Moniteur des Hôp.* Nos. 60, 61, 62.

ON TRANSPLANTATION OF THE DURA MATER

AS A MEANS OF DETERMINING

ITS PERIOSTEAL CHARACTER.

By M. OLLIER.

This paper forms a kind of complement to those we have already noticed (a), as having been read to the Academy of Sciences upon the transplantation of periosteum. While some experimental results, M. Ollier observes, have led a certain number of physiologists to regard the dura mater as a periosteum, clinical observations have not induced Surgeons to place much confidence in this membrane for the reparation of osseous parts, which have been removed, whether accidentally or by the trepan. His experimental resections of the cranium have led the author to believe with several observers that there are three sources of reparation of the osseous substance—the dura mater, the diploe, and the pericranium. But in consequence of the various difficulties produced by the conformation of the region and the proximity of the encephalic organs, this mode of procedure has not furnished results precise enough to supply a clear and definitive solution. He therefore has had recourse to the mode of experimenting which had furnished so peremptory a proof in favour of the theory of the formation of bone by the periosteum; viz., the transplantation of the dura mater to various regions of the body of an animal of the same species. Strips of this membrane grafted under the skin, in various regions, have given rise to perfectly-constituted bone, possessed of all the anatomical characters of normal osseous substance; and by virtue of this fact we are authorized in regarding the dura mater not only as a protective envelope for the brain, but as contributing directly to the ossification of the cranium. This property of the dura mater does not continue in the same degree in all ages, diminishing rapidly in proportion as growth is accomplished. Very well-marked at the commencement of life, it has become much less apparent by the time the skeleton has reached its complete development, and is exhibited in a still less degree when adult age is reached. When transplantation of a fragment of the dura mater is accomplished in the adult rabbit, only numerous and independent osseous granulations are produced on its surface. This influence of age explains to us why the facts observed in man appear so often contradictory, and why Surgeons usually only obtain incomplete reparation after trephining. All portions of the dura mater do not possess the property in a like degree, it being only the external surface of the membrane that does so—the fibrous folds not in contact with bone not being susceptible of ossification on transplantation. The greater proportion of these fibrous tissues at the base of the cranium, added to the difficulty of detaching the dura mater there without tearing it, explains why we obtain in general a more abundant ossification with strips taken from the convexity, than with the fragments of the same size detached from the bone.—*Comptes Rendus.* Tome xlix. p. 206.

EXCERPTA MINORA.

Case of Protracted Gestation.—Dr. W. Stone, of Manhattan, Indiana, relates a remarkable case. The subject was a married woman, whose husband died March 17, 1858. Her last menstruation was on February 20, and the last intercourse on March 10. Quickening occurred July 8, *i. e.* 133 days from last menstruation and 120 from the last intercourse. She was delivered February 3, 1859, of a female child, weighing eight pounds, whose osseous system was extraordinarily developed. The mother has always sustained an irreproachable character: and five Physicians who examined into the case were fully satisfied that it was one of protracted gestation—pregnancy having, therefore, continued for 330 days.—*Boston Journal*, May, p. 345.

New Operation for Stone.—An American correspondent describes the following operation as performed by Chas. Saignac:—"A deeply grooved staff, as large as a lithotrite, was passed into the bladder, and having been readily felt beyond the prostate by a finger passed into the rectum, a recto-vesical trocar and canula were introduced into the bladder, just as for retention of urine. The point of the

(a) *Medical Times and Gazette*, vol. xxxix. p. 476.

trocár, engaged in the groove of the staff, was made to glide along over the prostate, until it emerged through the urethra, outside the sphincter ani. The canula being left in place, a string was passed through it, and thus the chain of the *écraseur*, which, on the withdrawal of the canula, was attached to the body of the instrument, and slowly tightened. The *écrasement* occupied about four minutes, and when a complete division of the parts had taken place, two large calculi were readily extracted. No vessels were secured, and there was no hæmorrhage. At the end of two weeks the patient had complete control over the sphincter ani, and the wound was nearly healed."—*Boston Journal*, June, p. 421.

GENERAL CORRESPONDENCE.

MORBID APPEARANCES IN THE INTESTINES OF MISS BANKES.

LETTER FROM DR. WILKS.

[To the Editor of the Medical Times and Gazette.]

SIR,—I beg leave to send you an account of the morbid appearances found in the intestines of Miss Bankes, together with some remarks which I furnished to the attorney for the prosecution several weeks before the trial. The description may be interesting to some of your readers who have not seen the appearances detailed; and the remarks will show, I hope, that a Medical witness, because of necessity employed on one side of a case, is not, therefore, an advocate on that side. This explanation appears to be needed, as the public press presumes that the Medical testimony consisted of two opposing portions—the one for the prosecution, to prove the fact of poisoning; and the other for the defence, to explain the symptoms on the supposition of natural disease. Now, this is not correct; for I am of opinion that, with the exception of one or two witnesses on each side, who were dogmatically convinced of the truth of their own statements, if the whole of the Medical men engaged on the trial could have met together in council a very unanimous result would have been arrived at as to certain possibilities which all must have admitted, and to certain probabilities which none perhaps could have shrunk from. As regards myself, personally (and the same, no doubt, applies to others), I do feel some anxiety to be placed in a right position among my Medical brethren, as I find myself quoted amongst the number who maintain unequivocally the poison theory, because of necessity, on the side of the prosecution; whereas, I merely stated that the probabilities were in favour of it, and that, taking the post-mortem appearance alone, on which only I was called to give evidence, dysentery would produce a similar effect. This it was which led the counsel for the prisoner to ask two of the Medical witnesses for the defence whether they agreed with Dr. Wilks that the case might be one of dysentery; questions which I have not seen reported in any newspaper. The following is the description of the intestines, examined a few days after death, with the remarks forwarded to the solicitor engaged in the case:—

"The intestines lay in a coil, still held together by the mesentery. The first thing observable was that the peritoneal surfaces were adherent by a thin layer of lymph indicative of a recent inflammation; they were, however, readily separable and the exudation was little in quantity, showing that the peritonitis had been but of short duration.

"*Small Intestine*.—On opening the intestine throughout, and beginning the examination at the upper end, nothing remarkable was observed until the lower end of the ileum was reached, when at about three feet from its termination in the cæcum, the mucous membrane commenced to exhibit an inflammatory appearance; this was evidenced by a finely granular layer of lymph in and upon the surface. It was at this part seen only on some of the more prominent folds of the mucous membrane; but on proceeding downwards, this exudation became more abundant, until it entirely covered the last foot of the ileum. This inflammatory exudation could not be scraped off, as it was firmly united to the mucous membrane, and contained in its follicles. The glands of this part, the solitary and Peyer's, were not especially affected. Excepting a slight abrasion near the ileo-cæcal valve, there was no ulceration in the small intestines.

"*Large Intestine*.—The mucous membrane was ulcerated from end to end; the ulcers were of all sizes, the majority being about the size of a sixpenny-piece, mostly isolated, though some had run together, and, taking them as a whole, they occupied more than half of the internal surface of the large intestine. They were of an active and very recent character, and gave exactly the appearance in some parts as if the mucous membrane had been simply punched out, while in other parts they had their edges loose and sloughing: many pathologists, indeed, would rather have adopted the term sloughs than ulcers to these breaches of surface, since they appeared due simply to a loss of substance; but the expression 'ulceration,' is used in accordance with ordinary phraseology.

"Commencing with the rectum, or lower end of the large bowel, this ulceration was tolerably uniform in amount (the mucous membrane presenting these isolated patches of loss of substance) in the descending transverse and ascending colon, until the cæcum was reached, when inflammation of the most acute and violent character was observed. In this part not only was the mucous membrane superficially ulcerated throughout, but large portions of the structure were sloughing, and almost detached from the other coats of the bowel; thus a sloughing piece of membrane, about three inches square, hung loose into the interior, and on passing the finger beneath, it was found detached even to a still greater extent; the bare muscular coat was seen beneath, and a quantity of sero-purulent fluid had exuded into the sub-mucous cellular tissue around it. The muscular coat itself in the cæcum was likewise infiltrated with this exudation, and was consequently softened, and there is no doubt it was through this part of the intestine that some transudation had occurred which had set up the peritonitis; no actual perforation was discoverable.

"Another striking appearance presented by the internal surface of the intestine, besides the sloughing or ulceration, was an effusion of blood which existed throughout, but more especially in the cæcum. It was of a blackish colour, and not free within the bowel, but existed as a thin coagulum spread over the mucous membrane, intimately mixed with its secretions, and incorporated with blood existing in the follicles themselves, whence, no doubt, its source. The portions of mucous membrane which remained intact between the ulcers, presented no peculiarities, the solitary glands not being enlarged, nor indeed visible to the naked eye. A few mesenteric glands which remained attached to the intestine appeared healthy. The contents of the intestine were fluid; those in the upper part of jejunum yellow, as if mixed with bile.

"*Remarks*.—The appearance presented by the intestines showed that the inflammation was of a most acute character, and could not have been of more than two or three weeks' duration. If it had been older, or at all of a chronic character, it would have been indicated by the presence of firm inflammatory products in various parts of the intestines; the ulcers, instead of having sharply-defined or sloughing edges, would have had hard, raised boundaries, the submucous coat would have been thickened in parts, and probably the muscular coat hypertrophied; the whole large intestine would have been irregularly thickened and contracted, instead of being, as in this instance, dilated and thin. Moreover, in these chronic cases the mucous membrane is often of a slate colour, arising from the presence of pigment, having its origin in a decomposition of the blood, which has been effused at a former period of the affection; but in this case the blood was quite recent.

"Such an acute inflammation of the large intestine, however produced, is sufficient in itself to cause death; but, if associated with a peritonitis, the latter would in most instances be regarded as the immediate cause, being the last event in the morbid process, and a pathological condition of a peculiarly fatal nature.

"In considering our experience of disease of the intestine, it is needless to say that the present case bears no resemblance to any of the common forms of maladies affecting this part, as seen in tuberculosis, fever, etc., and this, moreover, is corroborated by the absence (according to Mr. Barwell's report) of all disease in other parts of the body. Its acute nature also removes it from the ordinary cases of ulcer of the bowel, which are of slow formation. An acute inflammation of the colon or colitis is, however, sometimes met with as an accompani-

ment of other diseases, as of the heart; but then it is slight, and is only regarded as a secondary affection.

"A primary or idiopathic acute inflammation of the large intestine constituting a fatal disease, is usually styled *dysentery*. It is comparatively rare in this country, though it is occasionally met with, either in isolated cases, or as an endemic in some particular locality or building, arising, as is generally supposed, from some definite local cause. The disease, in general terms, may be described as an acute inflammation of the large intestine, proceeding to ulceration and sloughing of the mucous membrane; but writers have hitherto disagreed as to whether the disease ought simply to be regarded as an intense inflammation of the mucous membrane of the ordinary kind, or whether it has not peculiarities of its own which can always distinguish it. This disagreement has arisen from there being two forms of disease, or probably two different stages of the same disease, the one where, after death, it is evident that the affection has commenced in the glands (the solitary) of the mucous membrane, these being swollen, filled with exudation, etc.; the other where, from the rapidly fatal nature of the case, the mucous membrane is found sloughing or gangrenous, and the portions of this tissue which may be left do not present any peculiarity of the glandular bodies. It is admitted, then, by those who would declare dysentery to be a peculiar affection, and one commencing in the glands of the part, that cases often occur where it is impossible to determine this fact satisfactorily; and, moreover, that in the rapidly fatal cases these glands may be found quite unaffected in any portions of mucous membrane which may be left.

"It is impossible not to recognise the resemblance which the present case bears to this latter form of dysentery, a form characterised by an acute inflammation of the whole mucous membrane, terminating in sloughing, and with effusion of blood from the surface; and especially resembling those cases which have terminated by a peritonitis."

I then state some particulars of cases which I have examined after death at Guy's Hospital, and that from nearly 3000 cases, I can only find two at all resembling the one under consideration. Cases of poisoning, of course, are excepted, though I may here state that the appearances presented by bichloride of mercury exactly resembled those seen in the late Isabella Bankes. The only two cases which were styled acute idiopathic dysentery, were those of two men who worked at the London Docks, and their illness was of five or six weeks' duration. One man died shortly after admission, and the other man attributed his illness to his eating a quantity of coarse brown sugar, which he was engaged in unpacking. The specimen, which is now in Guy's Museum, presents a large slough in the cæcum, and resembles very closely that of the deceased lady.

I then mention some of the more received opinions as to the cause of dysentery, its frequent occurrence as a limited or chronic affection of the bowel, and its rarity as an acute one, though occasionally it has occurred as an endemic, as described by Dr. Baly at the Penitentiary. At the same time I state that this part of the intestine being supplied by a peculiar glandular apparatus is the part most liable to be affected by the administration of any irritant, excepting those having some specific influence on particular organs. I conclude my observations with the following remarks:—

"Looking once more upon the case under consideration, although exhibiting a more acute inflammation of the intestine than I have ever seen (except in one or two instances before mentioned), I cannot say that it differs in character from such examples of idiopathic disease as I have described; and, apart from my own personal experience, I believe the condition which this intestine represents to closely resemble the more acute forms of dysentery occasionally observed, and therefore, if I met with such a condition accidentally (in making a post-mortem examination), although I should institute the strictest inquiries as to the possibility of any irritant having been taken during life-time, I should be obliged in the absence of all such evidence, to call the case one of acute dysentery. I should do so because I believe in the possibility of the disease occasionally, though very rarely, occurring, notwithstanding some very high authorities doubt the existence of the acute form in this country. In the present instance, therefore, from an examination of the diseased part, I could not say that it was not an example of acute dysentery.

"My conclusions, then, are, that although this acute inflam-

mation might be set up by an irritant poison, yet that as a primary form of disease does occasionally, though rarely, produce a similar effect, I am unable to determine which was the cause in operation in the present instance.

You, Sir, and your readers, will be able to see from this report, made several weeks ago, that the post-mortem appearances gave no unequivocal indication of the effect of poisoning, although the opposite has been stated by some of the public journals. My own opinion is, that in all probability an irritant substance caused the ulceration, but that the latter was not distinguishable from the dysenteric form, and consequently the prisoner should have had the benefit of the doubt on this point as on all others. One theory of the case is that a vegetable irritant might have been given to cause abortion, but that death unintentionally resulted; and I think this is very likely to be the case, for the supposition of arsenic (if it had been on the indictment) was entirely upset by the defence. There can be no doubt that the end of the ileum and large intestine are the parts of the alimentary canal most liable to be affected from various causes, for in them irritant substances lodge, and from being furnished with excreting glands it may be their function to get rid of noxious substances from the system; and in this manner it is thought by some that a poisonous miasma produces dysentery. From whatever cause, however, the proneness of this part of the intestine to be affected by disease or poisons is remarkable; thus, within a short time, I have seen a case where a quantity of dilute sulphuric acid was taken, and where (the stomach of course was affected) the small intestine was entirely unaffected, but the large intestine was inflamed in the way in which Dr. Thudichum called "diphtheritic." In another case, where, owing to a strangulated hernia, a woman had swallowed a quantity of most violent purgatives, the stomach and small intestines showed no indication of an irritant having been taken, and yet the colon was acutely inflamed. Bichloride of mercury is well known to produce this effect, and, as before said, the only cases of poisoning which I have seen, in which the intestine resembled that of Miss Bankes, were those by this substance. I may add, that I think those gentlemen who spoke of dysentery being a common affection, could hardly be aware of the fearful amount of destruction which existed in this case; as seen by the almost detached mucous membrane from the cæcum, the effusion of blood, and the peritonitis. I may remind your readers that although our public and professional press is taken up with controversies on the Medical evidence, instigated principally by the *Times*, which stated Smethurst's case to be purely a Medical one, yet that the Lord Chief Baron distinctly told the jury that the Medical evidence was unimportant, compared with the circumstantial; and it was upon this, chiefly, that the judge dwelt, and upon which he charged them to form an opinion. It is probably for this reason that the discussion still going on was thought to have little weight in deciding the ultimate fate of the prisoner.

I am, &c.

SAMUEL WILKS.

11, St. Thomas's-street, Southwark, Sept. 3.

"IRRITANT MINERAL POISON."

LETTER FROM THOMAS EDWARD AMYOT, ESQ.

[To the Editor of the Medical Times and Gazette.]

SIR,—The history of the following case would not have been offered for publication had not recent events thrown a double interest on the class of accidents which it relates. The Criminal Court has lately given our Profession an instructive lesson on the subject of caution and circumspection, and any facts serving to illustrate its teachings, while the circumstances of the Smethurst case are fresh in our recollection, appear to me well deserving our attention. The account of Miss Bankes's illness, as given by the Medical witnesses, might have stood (*mutato nomine*) for an incomplete one of my own patient, and without expressing an opinion (for which, indeed, I have no sufficient grounds) that the poison administered in the two cases was the same, I think I may fairly insist that such a thing was possible; and, if the possibility be granted, the importance of some of the Medical evidence would seem to me to be lost. But of this more by-and-by.

On the 20th of last December I was called to attend Mrs. B., a young, and usually healthy married woman, neither nursing nor pregnant, and the mother of four children. I

found her suffering from slight sore-throat, total loss of appetite, restlessness, great thirst, and other feverish symptoms, sickness, and considerable enlargement, with induration of the right cervical glands. She knew nothing of the cause of her illness, but had observed the swellings in the neck for some days. Treatment appeared useless, and the symptoms increased: she took to her bed, vomited every kind of food about twenty minutes after taking it; suffered greatly with tenesmus, with scanty, dark, pulpy motions; the urine scanty; the skin was clammy, pale, and doughy-looking. The pulse quick and thready; the abdomen was slightly tender over its whole surface; the mouth sore, with little blisters on the mucous membrane; the face swelled, and pasty, the expression anxious, and the state of exhaustion extreme. It is useless to enumerate the medicines employed, because they were utterly ineffectual in allaying, in the slightest degree, either the sickness or the tenesmus, the two most serious and distressing symptoms.

I was completely puzzled as to the true nature of the case, and my patient's condition became most alarming. Irritant poison was the thought uppermost in my mind; but her own mother was her nurse; and her husband I knew to be a gentle and inoffensive man. Had he been otherwise, and had I known him to have an interest in his wife's death; or had her nurse been of bad character, my suspicions, I fear, might have fallen on one, or both of them. As it was, however, I fixed my thoughts on a bright, perfectly clean-looking, and nearly new, copper tea-kettle, which stood by the bedroom fire, and from the water of which all the invalid's food was prepared. The water itself looked clear, but the fur on the sides and bottom had a faint sea-greenish hue. A pint of the water was poured into a mug, and a perfectly clean knife immersed. In a short time it was completely coated with copper, which, when dried and rubbed, showed the characteristic red hue of that metal.

The cause of mischief being removed, my patient vomited but once afterwards; the tenesmus ceased, the swelling of the glands, which had levelled the neck with the jaw, slowly subsided, as did the soreness of the mouth and the other symptoms, and by the beginning of February her recovery was complete, although she remained weak until the middle of March. During her recovery the stomach remained sensitive and impatient of any but the most bland and simple milk diet, and the effects of some articles of food were curious; acids of any sort, fruit, etc. gave the tingling sensation of a galvanic current to the mouth and teeth. This symptom, and the glandular indurations, I have not found described as symptoms of copper poisoning.

A few words as to cooking utensils. Copper stewpans and saucepans are often, and most justly, objects of suspicion, but it is generally thought that water alone will not act upon the metal, and the kettle, therefore, is disregarded (a). But water, when loaded, as in this locality, with bicarbonate of lime and chlorides, will affect it powerfully. In the case above detailed, the kettle had not been in use for some weeks, and when last put away had not been carefully dried. My patient, at the beginning of her illness, had suffered from toothache, and, being poorly from want of rest, had kept her room, and taken down this favourite for her own especial use. She kept it constantly on the hob and made tea from it. The more she drank the more she thirsted, and the more she thirsted the more she drank, taking a small dose of copper with every cup for some days before I was sent for, and continuing the dose in the shape of tea, gruel, and broth, until well-nigh at death's door.

I would ask, in conclusion, Whether it is not possible that Miss Bankes suffered from copper poisoning? If it be so, what importance should be attached to the very strongest point in the Medical evidence—the fact of two or three of her Medical attendants having come independently to the conclusion that she was suffering from irritant mineral poison? It is worthy of remark, that Mr. Sergeant Ballantine's question—"What do you include within the term irritant poisons?" was answered by the witness, "Antimony, arsenic, and corrosive sublimate,"—as if copper were not pre-eminently one of them, and, moreover, the one from which slow poisoning is most likely to occur. I am, &c.

LITERARY PROPERTY.

LETTER FROM MR. PYE H. CHAVASSE.

[To the Editor of the Medical Times and Gazette.]

SIR,—I consider an injustice has been done to me, and that the best way to obtain redress will be to lay my case before the Profession, which, with your permission, I will now do.

Some twenty years ago I published a work entitled "Advice to a Mother on the Management of her Offspring," This book has gone through four editions; the last was published in 1852. This year Dr. Herbert Barker published a work on a similar subject—"The Hygienic Management of Infants and Children." In this work Dr. Barker has copied portions of my book, almost *verbatim et literatim*, and without the slightest acknowledgment. The most glaring of which is the dietary of infancy. To prove my assertion, I will give you in parallel passages extracts from the two works:—

DR. HERBERT BARKER.

"2. If the above should not agree with the infant (although it often does if properly made), the boiled-flour food may be tried. Take a pound of flour, put it in a cloth, tie it up tightly, then put it in a saucepanful of water, and let it boil four or five hours; then take it out, peel off the outer rind, and the inside will be found quite dry, which grate. A small quantity of this boiled flour should be made into food in the same way as gruel is made, and then slightly sweetened with lump sugar. New milk, provided it agree with the child, may be added to the preparation."

"6. The rusk-food is very useful in some cases, and may be made with rusks boiled for an hour with water, which should be then either strained through a sieve, or well beaten up by means of a fork, and slightly sweetened with lump sugar. Great care should be taken to select good rusks, as few articles vary so much in quality."

"7. Another useful food is the top-crust of a baker's loaf, boiled for an hour with water, and then moderately sweetened with lump sugar. If at any time the child's bowels should be costive, *raw* may be substituted for *white* sugar."

"8. Rice food may be prepared in the following manner:—Soak some best rice in cold water for an hour; strain, and add fresh water to the rice; then let it simmer till it will pulp through a sieve; put the pulp and water into a saucepan, with a lump or two of sugar, and again let it simmer for a quarter of an hour. A portion of this may be mixed with new milk, so as to make it of the thickness of cream, and should be given by means of the bottle. If the bowels are much relaxed, the milk may be boiled, but not otherwise." — Dr.

MR. PYE H. CHAVASSE.

"If the above should not agree with the infant (although it almost invariably does, if properly made), take about a pound of flour, put it in a cloth, tie it up tightly, then put in a saucepanful of water, and let it boil four or five hours; then take it out, peel off the outer rind, and the inside will be found quite dry, which grate. . . . A small quantity of this boiled or baked flour should be made into food in the same way as gruel is made, and then slightly sweetened with lump sugar. . . . New milk, provided it agree with the child, may be added."

"A fifth and a very excellent one may be made with rusks, boiled for an hour with water, which should then be either strained through a sieve, or well beaten up by means of a fork, and slightly sweetened with lump sugar. Great care should be taken to select good rusks, as few articles vary so much in quality."

"A sixth food is the top-crust of a baker's loaf, boiled for an hour in water, and then moderately sweetened with lump sugar. If at any time the child's bowels should be costive, *raw* may be substituted for *white* sugar."

"An eighth is rice, prepared in the following manner:—Soak some best rice in cold water for an hour; strain and add fresh water to the rice; then let it simmer till it will pulp through a sieve; put the pulp and water in a saucepan, with a lump or two of sugar, and again let it simmer for a quarter of an hour. A portion of this may be mixed with one third of new milk, so as to make it of the thickness of good cream. It should be given by Elam's nursing-bottle. If a child's bowels be very much relaxed, and very weak, the milk may be boiled,

Herbert Barker's *Hygienic Management of Infants and Children*. 1859. Pages 32, 33. but not otherwise."—Mr. Pye Chavasse's *Advice to a Mother*. Fourth edition, 1852. Pages 40, 41, and 42.

In reviewing Dr. Herbert Barker's work, the editor of the *Dublin Quarterly Journal* for May, thought so highly of the above dietary, that he copied it *in extenso*, giving Dr. Herbert Barker praise for the same, but with what justice, your readers will now be able to judge. Of course, I exonerate the editor of the above highly respectable journal of all knowledge of Dr. Barker's unauthorised use of my work.

I am, &c. PYE H. CHAVASSE.

"NEW TREATMENT OF HYDROCELE."

LETTER FROM DR. GILLESPIE.

[To the Editor of the Medical Times and Gazette.]

SIR,—Under this title, two papers have lately appeared in the *Medical Times and Gazette*, the first of date February 26th, the second July 30th, 1859. These are brought forward for the purpose of proving that a seton composed of iron wire is the best method of treatment for the radical cure of hydrocele.

I need hardly stop to challenge the propriety of styling this a "new treatment" for hydrocele; but I may merely say in passing, that the seton was for a long period the favourite remedy, and the substitution of one substance for another is barely worthy of being dignified by the title "new treatment." I might with as much justice claim originality were I to bring forward mulled claret as infinitely to be preferred to the multitudinous injections for hydrocele that have been in vogue at various times.

It will generally be found when the great majority of the Profession set aside a once popular remedy, and adopt another, that there are good solid grounds for the change of practice; and, accordingly, it was after a long practical experience of the shortcomings of the seton, and the advantages of injections, that the latter mode of treatment came generally into use. It may be said that two main reasons induced the change:—1st, The frequency of suppuration during the employment of the seton; though Pott expressly stated that such should be avoided, his words being, "Suppuration is not only not intended, but should, as much as may be in our power, be guarded against."—"Radical Cure of Hydrocele," p. 36.) 2nd, The discovery that it was not necessary for the radical cure of hydrocele to effect obliteration of the cavity, stimulation of the absorbents merely being often sufficient. The injection of medicated fluids was found to answer the purposes desired, without incurring, in the great majority of cases, the tedious and occasionally dangerous process of suppuration; so the seton has, with justice, been displaced in public estimation.

Innumerable fluids have been proposed and tried with various degrees of success; port-wine for a long time continuing the favourite; but whether it be from the spread of teetotalism among Surgeons, (a) or the deterioration,—I might almost say disappearance,—of that much-prized beverage, port-wine has in a great measure been superseded by iodine. Instead of the clumsy method of distending the sac by injected fluid, and then drawing it off, the powers of absorption in the tunica vaginalis have been trusted to; from half-a-drachm to a drachm of the tincture of iodine being injected and retained. So far as experience has hitherto gone, this mode of treatment has been found at once the most certain and simple.

It now remains to be shown whether a return to the seton, as recommended by Professor Simpson and Dr. J. Young, is deserving of adoption. Professor Simpson proposed the wire seton from theoretical inferences. These were founded on the fact that metallic wires when placed in living tissues, "did not, as a general law, excite inflammation to a higher stage than that of adhesion, or the effusion of coagulable lymph." (b.)

Supposing this general law to be admitted, it does not follow that the metallic seton is the most certain and the

best radical cure for hydrocele. The accumulation of fluid in hydrocele depends on one of two causes, or possibly both,—abnormal activity of the secretory, or torpidity of the absorbent apparatus.

The true object to be attained in effecting a cure is restoration of the tunica vaginalis to a healthy state. That the seton is not likely to be followed by such a result, is not even denied by its supporters; for it is expressly stated that the wire seton is intended to produce occlusion of the sac by adhesive inflammation.

In the case of a large hydrocele it is evident such a condition cannot with certainty be attained, for only the parts in contact with the seton, or in its immediate proximity, may be roused to adhesive inflammation, and a considerable portion of the sac may continue to indulge in its faulty secretion. It is, therefore, much more rational to suppose that fluid injections, which are certain to be closely applied to the whole surface of the membrane, will exercise a more uniform and more salutary influence on the abnormal state of the tunica vaginalis.

It is admitted that sometimes injections may cause too active inflammation, but that is almost invariably of the adhesive kind.

So far as my experience goes it is very rarely indeed that suppuration has followed the employment of iodine injections. Whether I can speak so confidently of the wire seton, the sequel will show.

Dr. James Young founds his recommendation of the wire seton on grounds somewhat different from those advanced by Professor Simpson. He says:—"Two reasons why this operation may be considered an improvement are,—1. Because of the comparative freedom from pain; and, 2. Because it effects a cure much more speedily." (c)

For the purpose of advancing his own peculiar views, it appears to me,—and I am satisfied all who have had frequent experience in the treatment of hydrocele by injection will coincide in the remark,—that Dr. Young has exaggerated most materially the amount of pain arising from injection. Soon after the application of the iodine, the patient feels a smart burning sensation of pain, but its severity soon subsides; whereas, by his own showing, the pain of the wire seton goes on increasing for two, three, or even four days, ere relief is attempted to be given by its removal.

It so happens that I was induced to try the iron wire seton in two cases, and the result of my experience is so utterly opposed to that of Dr. Young, that I feel it due to the much-disparaged treatment by injection to bring forward my cases.

Case 1.—A. K., aged 68, a labourer, admitted into the Royal Infirmary, January 26, 1859, with an indolent ulcer of the leg, and a hydrocele of the left side, of four years' duration. As regards the hydrocele, palliative treatment only has been adopted, it having been tapped about twice a year. It is now of the size of a large cocoa-nut. On February 10th two iron wires were passed through the anterior part of the hydrocele by a long lance-pointed packing needle. The fluid trickled through the openings thus made, and the contents were soon evacuated. The scrotum was then supported by bandages, and the patient kept his bed. Eighteen hours afterwards the left side of the scrotum was swollen, to nearly the original size of the hydrocele. The swollen part very hard, but not very tender to the touch. Twenty-four hours after its introduction the seton was removed.

No symptomatic fever followed, and under rest, fomentations, and bandaging, the swelling satisfactorily subsided. For a week thereafter the case was exhibited to the students as a radical cure of hydrocele by the metallic wire; but, unfortunately, symptoms of a reappearance of fluid began to show themselves, and by the 9th of March, the tumour was as large as ever. The iron wire seton was again introduced in a similar manner, but involving a larger portion of the sac, and it was determined to retain it longer. Thirty hours thereafter the parts were hard and swollen. The seton was removed on the expiration of forty-eight hours from its introduction. The progress of the case seemed satisfactory till the evening of the second day, when high fever set in, the pulse being 130, the tongue dry and furred, and the scrotum very painful and tender.

The tumour increased in tenseness, and an obscure feeling of fluctuation gradually became developed. A free incision

(a) In Scotland more especially.

(b) *Edinburgh Medical Journal*, December, 1858, p. 547.

(c) *Medical Times and Gazette*, July, 30, 1859.

was made, and a quantity of very fetid sloughy purulent matter was evacuated. The cavity of the tunica vaginalis was eventually filled up by granulations, and the patient left the Hospital on April 24th, his cure by the wire seton having occupied exactly 73 days!

During my treatment of this case, but unfortunately before its failure, another opportunity presented itself in private practice, for my putting to a test the value of the wire seton. I consider the following case a most instructive and, indeed, conclusive one, for I was enabled to institute a comparison between the simple tapping, the tapping with injection of iodine, and the wire seton.

Case 2.—J. P., aged 68, a master shoemaker, of regular habits. This patient applied to me for advice owing to his suffering much inconvenience and difficulty in making water. I found this arose from large hydroceles on either side, which almost completely concealed the orifice of the penis. On the left side the tumour was of an oval shape, on the right it was more pyriform. I determined on passing the wire seton through the left side, and accordingly did so in the way recorded in the previous case. On tapping the lower part of the right side, it became evident that a large hydrocele of the cord also existed, so leaving alone the tunica vaginalis after its evacuation, I tapped and injected about half-a-drachm of the tinct. iod. into the hydrocele of the cord. During the first hour or two, the patient complained most of the injected tumour, but before evening the pain had much subsided. Next day the scrotum was as large as ever, most tender over the seton. The following day, forty-eight hours after its insertion, the seton was withdrawn, and the scrotum was well fomented. On the third day, the scrotum over the place of insertion of the seton was very red and painful, while the hydrocele of the cord felt solid, but comparatively free from pain. The hydrocele of the right side was much smaller in size. It is needless to follow this case very minutely, suffice it to say, the sac of the hydrocele, through which the seton was passed,—suppurated, requiring two different incisions for the evacuation of matter, and taking nearly three months ere it became perfectly healed; the serous fluid of the hydrocele on the right side was re-absorbed and has never re-appeared; while all that can at present be felt of the hydrocele of the cord is a slightly hard, but not painful lump, about the size of an almond, lying at the upper part of the scrotum.

It will be seen from the details of these cases, that the treatment by the wire seton is not always such a simple, painless, and effectual remedy, as its advocates would make out. On none of the three occasions on which I used it, was it allowed to remain so long, as in all the cases recorded by Dr. J. Young, yet suppurations of unusual severity occurred twice. The uncertainty of the method may be shown by what took place on removal of the seton, at the end of twenty-four hours. An apparent cure was effected, and had it not been that the patient was kept in Hospital by his sore leg, I might still have been under the delusion, that I had achieved a triumph with the metallic suture; and the patient by his dismissal, cured, might have been spared a long subsequent course of suffering.

I suspect if Dr. J. Young will gather together his cases of cure at the end of a few months' time, he will find several in the same predicament, as the patient of whom he reports on July 30th, 1859:—

"I have operated on another patient with equal success. The patient was by trade a smith. The hydrocele was produced by a severe stroke. This patient after being cured became careless, got intoxicated, and received another blow, which reproduced the disease a month or two after being cured."

If such a radical cure is to involve the necessity of the patient's avoidance of carelessness, his abstinence from drink, and freedom from blows, the morals of the individuals afflicted with hydrocele must also be taken under treatment.

I am, &c. JAMES D. GILLESPIE, M.D., F.R.C.S. Edin.
Surgeon to the Royal Infirmary, Edinburgh, etc.

A NEW DIURETIC.

LETTER FROM MR. BYERLEY.

[To the Editor of the Medical Times and Gazette.]

SIR,—Permit me, through the medium of your Journal, to call the attention of the Profession to the diuretic properties

of one of our indigenous plants, "*Erodium Cicutarium*," the "Stork's-bill."

Gentlemen living near the coast, where there are sandhills, will have ample opportunities of testing its efficacy, as it grows abundantly in such localities.

A neighbouring Medical friend, Dr. Parr, who had seen the plant tried, in one instance by an amateur, and in the other under his own superintendence, brought me a specimen that I might name it. He described its diuretic powers as somewhat marvellous, and stated that in each case the curative effects were speedy and permanent; although the varied means usually resorted to in such cases had been steadily but unsuccessfully employed for a length of time previously. A case of my own, in which there is ascites with hepatic disease, is improving under its use, the quantity of urine having increased considerably, with much diminution in the amount of effused fluid. The mode of preparation is to infuse an ounce of the dried plant (every part of it) in three pints of water, stewing it in an oven until two pints remain. The dose for an adult is four or five fluid ounces three times a-day; probably more may be needed in some cases.

It would be satisfactory to know the results which may arise from a further application of the remedy in other hands.

I am, &c. ISAAC BYERLEY, F.R.C.S. F.L.S.
Seacombe, Cheshire, August 17.

QUININE TREATMENT OF PERITONITIS.

LETTER FROM DR. C. HANDFIELD JONES.

[To the Editor of the Medical Times and Gazette.]

SIR,—Will you allow me through your medium to express my thanks to your correspondent (personally unknown to me) for the very interesting further account he has given us of M. Beau's treatment of acute peritonitis? I gladly accept his warranty as to the soundness and accuracy of M. Beau's judgment, and I believe he will agree with me as to its value under the circumstances. That a different effect may be produced by the administration of small and large doses of quinine cannot be doubted; yet I cannot but think that in the ordinary cases of inflammatory disease we have to meet in England there would be very considerable risk of aggravating the mischief if we attempted to induce quinsism. The trials which have been made in this country of this mode of treatment in typhoid fever and acute rheumatism have been by no means successful; so far at least as I know.

With regard to the latter disease particularly, I should feel greatly interested in hearing some details of cases treated by M. Beau in the manner your correspondent mentions. To my mind, inquiries into the therapeutics of disease are of the highest importance, not only for their practical result, but for the light they shed on the nature of the morbid process.

I am, &c. C. HANDFIELD JONES.
33, Albion-street, Hyde-park, W.

FISTULA IN PERINEO OF TEN YEARS' DURATION.—EXTRAVASATION OF URINE, SUPPURATION, AND GANGRENE.

LETTER FROM MR. J. E. SMYTH.

[To the Editor of the Medical Times and Gazette.]

SIR,—I send the following case for publication in your excellent Journal, if you consider it, as I do, not devoid of practical interest.

I am, &c. J. E. SMYTH, M.R.C.S. etc.
2, China-terrace, Lambeth.

W. A., aged 58, a stonemason, obtained an order from the Lambeth Workhouse for my attendance, on September 22, 1858. I saw him the evening of the same day, and found him suffering from pain, redness, and swelling of the perineum and scrotum, which he attributed to sitting on cold stones at his employment. His tongue was loaded; bowels constipated; urine high-coloured; pulse 120. I ordered fomentations to the scrotum; also the following:—*R. P. jalapæ gr. xv., hydrarg. chlorid. gr. v. statim sumend.; p. nit. potass ʒj. ant. tart. gr. ij., mist. camph. ad ʒvj. st. coch. ampla ij. horis 4tis.*

Sept. 23.—I visited him earlier this day; his bowels had been freely opened; he passed his urine more abundantly; but the inflammation of the scrotum was rather increased. He had but little sleep. The mixture and fomentations were directed to be continued, with the following.—P. ipecac. co. gr. xij. h. s. s.

24.—The inflammation of the perinæum and scrotum had increased much; he spent a very restless night, and was altogether considerably worse. On examination I could now detect evident fluctuation in the perinæum; also a small opening anterior to the anus, through which, on pressure, a few drops of thin purulent matter escaped. On questioning him, I discovered that this opening had existed for the last ten years, having been occasioned at that time by the bursting of an abscess in that situation—a fistulous opening communicating with the urethra, from stricture of which canal he had suffered at that period. My friend, Mr. P'ou, having seen the case with me this evening, I made a free incision in the mesial line of the perinæum, when about a teacupful of highly offensive pus, mixed with urine, was discharged. We ordered him an opiate at bed-time, and poultices to the perinæum and scrotum.

25th.—This morning he expressed himself much relieved, having slept soundly through the night. He passed about a quart of urine per urethram since yesterday morning. He was ordered broth, and six ounces of wine daily. I attempted to pass a catheter, but could not do so, owing to the irritable state of the urethra.

26th.—Continues much the same; passes his urine, as before, in a small but continuous stream. Swelling and redness of the scrotum not much decreased.

27th.—From this date to October 2, the same treatment was continued; but the integuments of the scrotum having assumed a more livid hue, indicating subjacent mischief, I made an incision along the raphe about three inches in length, and one and a-half inches in depth, through a mass of gangrenous cellular tissue, extending to within half-an-inch of the first perineal section. In the course of some days the sloughs became separated, leaving a healthy wound, which, with that in the perinæum, has since healed up.

During this period I was enabled to introduce a gum elastic catheter, which was retained in the urethra for twenty-four hours, but had to be withdrawn, owing to its having been clogged up, the urine escaping by its side, and through the fistulous opening. By its introduction I ascertained the existence of an old stricture in the membranous portion of the urethra. I consequently commenced the use of the silver catheter, beginning with No. 5, and gradually increasing the size to No. 11. By these means, in the course of a few weeks the fistulous canal has become obliterated, and the man is now able to pass his urine in a full stream.

In this case it is worthy of remark, that no retention of urine at all existed, as it escaped all along both by the natural passage, and also through the fistulous opening. Notwithstanding which, extravasation of this fluid took place, giving rise to suppuration and gangrene of the cellular tissue. The result also shows the advantage of sufficient free and deep incisions to give exit to the sloughs, to prevent sphacelus of the integuments, and to save the constitution a protracted if not fatal struggle. Besides, the cure of a chronic urinary fistula of ten years' standing, by gradual dilatation of the natural passage, is, I think, a fact deserving of notice.

REMOVAL OF SEWAGE.

LETTER FROM MR. JAMES.

[To the Editor of the Medical Times and Gazette.]

SIR,—Yesterday I saw in the *Medical Times and Gazette* of June 25, a notice bearing on the Thames Sewage, and a letter, from Mr. Napier, of Worcester, proposing a plan in many respects resembling one that I submitted in 1857 to the Referees on the Metropolitan Sewage question. I sent in the first instance to Mr. Simon, and was by him recommended to send it to the referees. As no further notice was taken of the matter, I should have let it sleep, if I had not seen this notice in your Journal, which makes me think it may not yet be too late to prevent the unnecessary outlay of money and waste of sewage which is contemplated, and which at all events will benefit the owners of property in the metropolis, at the

expense of a dead weight on the rest of the kingdom. If you think the following copy of my letter worth insertion, it is at your service:—

[Copy.]

"REMOVAL OF SEWAGE."

"It has occurred to me that this might be effected in such a way as to relieve the river, save the sewage, and distribute it to a much greater distance and in a less concentrated form than has hitherto been contemplated. My plan is sufficiently simple. It is that the sewage of London should, as now, be discharged on the banks of the Thames, but not *into* the river. Reservoirs floating on its surface might receive it, and being moveable might transmit it as they are filled, up and down far and wide. To speak more precisely—

"If the sewage were to be conducted to suitable points of embouchure on the banks of the river it might be received into barges properly constructed, such barges containing a number of small tanks of the size of an ordinary cart. The sewage might empty itself into these until all were filled, when the barge might be moved away and another supply its place. These barges might then be towed up or down the river by steam—those up the river need be shallow, those down deeper.

"On the banks of the river, at different distances, and near the lines of existing roads or lanes, there should be stations made with platforms, alongside which the barges may be moored, and communications established with the roadways; the small tanks might then be run out and placed on frames with wheels, drawn into the interior of the country, by the purchasers, and returned when empty.

"In this way the sewage would be distributed over a large extent of country, including the shores of Kent, Essex, Middlesex, Surrey, and perhaps Berks; any dangerous concentration of effluvia be avoided, and the benefits of manure much more largely distributed; the expense probably less than the plans in contemplation, and positive remuneration after the first outlay the result.

"Some objections present themselves which must be considered. The first is, that barges could not be moored close to the banks throughout a large part of the river's course; speaking of the metropolis itself. The answer to this is twofold; 1st. It has, I apprehend, been proposed to carry out embankments, which would obviate this objection, but the expense would be great, and my plan would greatly diminish its necessity on the score of health. 2ndly. It appears to me that the piers supporting the ends of the bridges would afford five points on either side of the river well adapted for the purpose; culverts receiving the sewage from branches being carried out as hereafter sketched.

"The second is that the free course of the numerous steamboats might be obstructed by barges moored alongside the banks, but this objection would also be met by placing the culverts at the bridge ends; for steamboats do not pass under the corresponding arches.

"The third is, that although by such a plan the banks of the river generally would be relieved from the effluvia, this might not be the case at the point selected. This raises an engineering difficulty, but not, I should apprehend, a very great one, as the tanks on board the barges might be so arranged as to admit of stench traps, or some similar means, which I will not now particularise, intercepting the effluvia. There may be other objections which have escaped me, but these are the chief, and capable of being met.

"This plan would render the enormous expense of two collateral culverts unnecessary, but I would submit that even if that mode should be adopted, the sewage would be better distributed by being received into barges, such as I have described, and laid over extensive and widely-separated tracts of land, than by being received into any great reservoir or reservoirs.

"I may err in supposing it original; but if original and practicable it will, I am sure, receive from the referees and Sir B. Hall the attention which the importance of the subject must command.

"I am, &c.

(Signed) "J. H. JAMES."

The principle of Mr. Napier's plan is the same as mine, and as an experienced engineer his adaptation is perhaps the best; but there may be points in my own deserving notice, and I therefore offer it through your pages.

I am, &c.

J. H. JAMES.

Exeter, Aug. 8, 1859.

ACONITE IN TRAUMATIC NEURALGIA.

LETTER FROM MR. USSHER.

[To the Editor of the Medical Times and Gazette.]

SIR,—If the enclosed case possesses any interest, I shall be obliged by your giving it a place in the *Medical Times and Gazette*:—

Mr. B. came to me early in August, complaining of acute pain in the left arm, extending from the thumb to the shoulders, in the course of the musculo spiral nerve. He had, by accident, almost severed the top from the thumb, the nail was apparently dead, and the flesh did not present a very promising aspect. I placed the parts in apposition, and kept them so, in a few days union was complete.

I thought I was now done with him, but not so; for he came back very shortly with excruciating pain shooting from the thumb over the inner condyle of the humerus, and from thence crossing the biceps above and penetrating also the muscles on the back of the arm till it reached the shoulder-joint. At first I thought there was some inflammation extending through the lymphatics, but on uncovering the arm there was no swelling, redness, or tenderness on pressure to be found along the track of pain. He was a nervous person, of lymphatic temperament, and seemed much afraid of his arm. However, as it was the left member, his business was not interfered with. He was ordered a rhubarb draught, with sulphate of potass, etc. and a liniment composed of equal parts of chloroform, anodyne, and soap liniments, which he was to rub assiduously over the seat of pain. A flannel roller was applied over the arm, and a narcotic provided for use. The next morning he looked very mournful indeed; he was peevish, irritable, evidently in great pain, and had passed a restless night. The use of the actual cautery and electricity were proposed. He did not relish either. I did not expect to see him again, and some days passed before he made a reappearance. During the interim his liniment was used, and he now visited me for another purpose. I inquired how the arm went on. It was worse than before. Again the arm was exposed and carefully examined, the only conclusion I could arrive at was that the nerve had been injured; aconite in tincture was painted over the track, allowed to dry, and applied a second time.

In a short time he came to consult me for an attack of sore-throat, and I was not a little surprised to find that all his sufferings from the arm were at an end. The limb was benumbed by the remedy, but no return of pain was experienced. I had used, and seen aconite used, scores of times for rheumatic and other pains about the chest, but had not any idea of its efficacy in a case like the present. The tincture of the root is generally light in colour; what I used was of a dark brown, and, to judge from the effect produced, excellent. It certainly deserves a more extended trial. In cases of facial pain it acts well, when combined with belladonna, and forms a very useful application when mixed with equal parts of chloroform and anodyne liniment.

I am, &c.

HENRY USSHER, B.A. M.A. (late of the Royal Navy.)
4, Winchester-place, Pembroke-villas,
Notting-hill, August 20.

CASE OF PLACENTA PRÆVIA.

LETTER FROM DR. MORRIS.

[To the Editor of the Medical Times and Gazette.]

SIR,—Will you kindly insert the enclosed case of Placenta Prævia in your valuable publication?

M. T., aged 39, the mother of seven children, was attacked with uterine hæmorrhage on July 18, 1859, being then in about the eighth month of utero-gestation. There were no pains, and the os uteri was not dilated. She was ordered to be kept at rest, and gallic acid and opium prescribed. I saw her frequently during the next fortnight, in which time there were occasional discharges of blood. Suspecting it was a case of placenta prævia, I requested her to send for me immediately on labour commencing. Accordingly, about 12.30 a.m. on July 31, 1859, I was hastily summoned, a distance of five miles, to her assistance. When I arrived, I found there had

been slight pains, attended with profuse hæmorrhage, and she was faint and alarmed. A glass of brandy was administered; and on making an examination, I found the os uteri about the size of a florin, and the placenta centrally attached. I plugged the vagina with a silk handkerchief, and waited. At the expiration of two hours I removed the plug; the hæmorrhage returned. The os was now about the size of a crown-piece, soft and dilatable. I now introduced my two fingers, and separated the placenta as high as I could reach, and found the head presenting. The hæmorrhage did not, however, cease; I therefore gradually dilated the os uteri with my hand, and effected delivery by podalic version, taking the precaution to give a dose of ergot during the passage of the head. I then removed the placenta, and had the satisfaction of finding the uterus firmly contracted. A compress and binder were then applied, and, as she felt faint, some brandy and opium given. At the expiration of two hours she was sufficiently recovered to be able to be made comfortable, and, with the exception of feeling weak, is now as well as after an ordinary confinement. The child was stillborn, and the Marshall Hall method was of no avail.

Remarks.—It appears from the above case that the hæmorrhage does not always cease on the separation of the placenta from its attachment to the cervix uteri; the only chance of saving the patient, therefore, was to effect delivery as speedily as possible.

I am, &c.

Swindon, August 20.

FRED. H. MORRIS, M.D.

THE UNIVERSITY OF LONDON AND THE MEDICAL COUNCIL.

The following is the report by John Thompson, T. W. Saunders, and C. J. B. Hertslet, Esqrs., Barristers-at-law, of the case *Reg. v. Storrar*, heard in the Court of Queen's Bench on the 6th of June, a short account of which we gave in a former number.

University of London—Senate—Graduates.

The Senate of the University of London is the proper body to elect a Member of the General Council of Medical Education in pursuance of the 21 & 22 Vict. c. 90.

This was a case for the opinion of the court as to the legality of the election of Dr. Storrar by the Senate of the University of London, to be a member of "The General Council of Medical Education and Registration of the United Kingdom."

By the Medical Practitioners Act (21 and 22 Vict. c. 90, s. 3) a Council is appointed to be styled "The General Council of Medical Education and Registration of the United Kingdom."

By sect. 4, the General Council shall consist of one person chosen from time to time by each of the following bodies (mentioning among others, the University of London.)

The University of London is constituted by charter a body politic and corporate, consisting of a chancellor, vice-chancellor, fellows, and graduates. By another clause, the chancellor, vice-chancellor, and fellows for the time being are constituted the senate with the entire management of and superintendence over the affairs, concerns, and property of the University.

The question argued was as to the right of the graduates to take part in the election of the member of the General Council of Medical Education.

Edward James (T. J. Clark and Littler with him) for the graduates.—The franchise is given to the University of London; that is, to the body at large, and the senate therefore was not the proper body to elect: (21 and 22 Vict. c. 90, ss. 3, 4, 5, 18, 53; *Rex. v. Ginever*, 6 T. R. 732; *Rex. v. Cuthbeth*, 4 Burr, 2204: 1 Ld. Ray. 496).

Welsby contra.—There are difficulties on both sides; but looking at the object and purposes of the Act and the several provisions of the charter, the senate is the proper body to elect. There is no machinery for the purpose of assembling the graduates to elect. The 17 & 18 Vict. c. 114 (to extend the rights of graduates of Oxford and Cambridge in respect to the practice of physic to the graduates of the University of London) was referred to.

Cur. adv. vult.

Lord CAMPBELL, C.J.: The question which we have to

determine in this case is, whether the defendant had been duly elected by the University of London a member of the General Council of Medical Education of the United Kingdom under the statute 21 and 22 Vict. c. 90. This statute enacts that this General Council shall consist of one person chosen from time to time by each of certain specified bodies politic, among whom is the University of London. That is the only designation and the only definition of the body to whom the power is given. On November 3, 1858, the defendant was elected a member of this General Council by the chancellor, vice-chancellor, and fellows of the said University, and he has since acted as a member of the Council. On the part of the relator it is contended that the election of a member of this Council by the University of London cannot be made by the Senate, but must be made by all the persons enumerated in sect. 3 of the last charter granted to the University, comprehending all the graduates of the University. As the right of election is given by this statute to the University of London, and as the charter by sect. 3 constitutes certain individuals therein designated, and all persons on whom the University had conferred degrees, and all persons on whom the University shall thereafter confer degrees, one body politic and corporate, by the name of the University of London; and as sect. 4 ordains that the said body politic and corporate shall consist of a chancellor, vice-chancellor, fellows and graduates, if nothing to the contrary appeared in the charter, there would have been some strong ground for contending that the election in question should be made by all those who are ordained by the charter to constitute the University, and therefore that all the graduates of the University ought to have a voice in the election; but regard must be had to sect. 8, which ordains that the chancellor, vice-chancellor, and fellows for the time being shall constitute the Senate of the University; and to sect. 18, which ordains that the chancellor, vice-chancellor and fellows for the time being shall have the entire management of, and superintendence over, the affairs, concerns, and property of the said University; and in all cases unprovided for by the charter, it shall be lawful for the chancellor, vice-chancellor, and fellows, to act in such manner as shall appear to them best calculated to promote the purposes intended by the University. Now, the election of a member of the Medical Council is a case provided for by the charter, and it seems to come within the scope of the affairs and concerns of the University, over which it is ordained that the Senate shall have the entire management and superintendence. If so, the members of the Senate ought to choose a member for the Medical Board, acting in such manner as shall appear to them best calculated to promote the object in view. However it might have been, if an Act of Parliament had conferred on the University of London the right of electing a member of the House of Commons without more distinctly defining the franchise, it can hardly be supposed that it was intended by the Legislature that all doctors in law, doctors in medicine, masters of arts, bachelors of law, bachelors in medicine, and bachelors of arts, who may be graduates of the University of London, should be assembled to choose these members of the Medical Board—a choice in which the great bulk of them are likely to take no interest, and which might be made more conveniently and more discreetly by the chancellor, vice-chancellor, and fellows constituting the Senate. For these reasons we think that the election in question by the Senate was valid, and that we are bound to give judgment for the defendant.

Judgment for the Defendant.

EXPERIMENTS OF "WATERING" the streets with hydrochloric acid have been tried at Lyons. The acid is said to harden the road and keep it moist. In the Place Bellecour, during the hottest part of the day the ground (thus moistened), although dry and gravelly, has the appearance of being as consistent and damp as if it had been watered half-an-hour before. But as evening approaches the moisture becomes more and more perceptible. Every morning the ground is stiffer and more comfortable to walk on. This may be easily accounted for; the acid, decomposing the gravel or stone, forms one or several deliquescent salts, which therefore attract the moisture of the air. The question as to whether roads thus watered are likely to last as long as they ought, can only be decided by time.

MEDICAL NEWS.

ROYAL COLLEGE OF PHYSICIANS—The following Extra-Licentiates of the College were admitted Members, under the Temporary Bye-Laws, at the Comitia Majora held on Wednesday last September 7th:—

BRADSHAW, WILLIAM WOOD, Reading
COOPER, THOMAS HENRY, Slough, Buckinghamshire
EVANS, OLIVER, Royal Marine Hospital, Woolwich
JOHNSON, HENRY, M.D., Shrewsbury
NEALE, MELVILLE, Royal Military College, Sandhurst
ODDEN, JAMES, Manchester
PORTER, JOHN HENRY, Cheltenham
SCOTT, ROBERT JOHN, Plymouth, Devonshire
TURNAM, JOHN, M.D., Devizes
WHITE, FREDERICK BLUNDSTONE, Backwell, Somerset
WILLIAMS, CALEB, M.D., York

At the same Comitia the following Graduates in Medicine were also admitted Members of the College under the temporary Bye-Laws:—

ANDERSON, WILLIAM ALEXANDER, M.D., Hillingdon, Middlesex
ALEXANDER, WILLIAM, M.D., Halifax
BANKS, JOHN TATUM, M.D., Crawley, Sussex
BEGLEY, WILLIAM CHAPMAN, M.D., Hanwell
BIGGS, JAMES STRANGE, M.D., Surrey County Lunatic Asylum
BRIGHT, JAMES RICHARD DOUGLAS P., M.D., Cambridge-sq., Hyde-pk.
BROUGHTON, HUGH HENSHALL, M.D., Preston
CHADWICK, CHARLES, M.D., Leeds
COATES, CHARLES, M.D., Bath
COLLINGWOOD, CUTHBERT, M.B., Liverpool
DRAKE, AUGUSTUS, M.B., Exeter
EVANSON, RICHARD TONSON, M.D., Torquay
GEE, ROBERT, M.D., Liverpool
GIBB, GEORGE DUNCAN, M.D., Portman-street, Portman-square
GREENWOOD, HENRY, M.D., Blackheath
GUY, THOMAS, M.D., Rochester
HAKE, THOMAS GORDON, M.D., Spring-gardens
HALFORD, GEORGE BRITTON, M.D., Victoria-square
HARDINGE, HENRY, Sackville-street
HARRISON, JAMES BOWER, M.D., Higher Broughton, Manchester
HARLEY, GEORGE, M.D., Harley-street
HAWKINS, JOHN VINCENT, M.D., King's Lynn, Norfolk
HAWARD, EDWIN, M.D., Harley-street
HEATON, JOHN DEAKIN, M.D., Leeds
HESLOP, THOMAS PRETIUS, M.D., Birmingham
HOBSON, BENJAMIN, M.B., late of China
HOOPER, JOHN, M.D., Hoddesdon, Herts
INMAN, THOMAS, M.D., Liverpool
JONES, CHARLES, M.D., Manchester-square
JONES, JAMES, M.D., Woburn-place
KING, HENRY STAVELEY, M.B., Lower Grosvenor-street
KINGSLEY, GEORGE HENRY, M.D., Bridgewater-house
KINGSLEY, HENRY, M.D., Stratford-upon-Avon
LEWIS, WALLER AUGUSTUS, M.B., Medical Department, G.P.O.
LUCAS, T. PRESTWOOD, M.D., Brecon, South Wales
MC EWEN, WILLIAM, M.D., Chester
MCWILLIAM, JAMES ORMISTON, M.D., Trinity-square, Tower-hill
MITCHELSON, GEORGE FREDERICK, M.D., Kensington-garden-terrace
NORTON, ROBERT, M.D., Bayswater
NOYES, HENRY GEORGE, M.D., Lee, Kent
OGLE, WILLIAM, M.B., St. George's Hospital
PALEY, WILLIAM, M.D., Halifax
PALMER, EDWARD, M.D., Lincoln County Lunatic Asylum
PICKERING, JOHN, M.D., Winchester
POWELL, ROBERT HUTCHINSON, M.D., Wyndham-place, Bryanstone-sq.
PRIESTLEY, WILLIAM OVEREND, M.D., Somerset-street, Portman-square
RAMSAY, WILLIAM, F. H. M.D., Somerset-street, Portman square
RICHARDSON, CHRISTOPHER THOMAS, M.B., Hinde-street
ROBERTSON, CHARLES ALEXANDER LOCKHART, M.B., Hayward's-heath
SHERLOCK, JAMES, M.D., Worcester County and City Asylum, Powick
STILLWELL, GEORGE JAMES, M.D., Moorcroft, Hillingdon, Middlesex
STOOKES, ALEXANDER RICHARD, M.D., Liverpool
SYKES, JOHN, M.D., Doncaster
TRAVIS, NATHANIEL ALLEN, M.D., Nice, Sardinia
TYACKE, NICHOLAS, M.D., Chichester
TUIE, THOMAS HARRINGTON, M.D., Chiswick
WATERS, JOHN, M.D., Bedford-square
WILLIAMS, PHILIP HENRY, M.D., Worcester
WITHECOMBE, JOHN REES, M.D., Grosvenor-street
WRIGHT, JOHN JAMES, M.D., Malton, Yorkshire

APOTHECARIES' HALL.—Names of gentlemen who passed their examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 1st September:—

HAMERTON, ERNEST, Elland, Yorkshire.
HOSKINS, EDMUND JOHN, North Perrott, Crewkerne.
JOYCE, THOMAS, Stamford-hill.
PARKES, THOMAS, Nightingale-vale, Plumstead.
POWELL, WILLIAM EDWARD, Leeds.
ROYLE, ARNOLD, Southampton.

APPOINTMENTS.

POWER.—Henry Power, M.B., F.R.C.S., Assistant-Surgeon to the Westminster Hospital, has been appointed Lecturer on Physiology in this Medical School.

GERVIS.—Mr. H. Gervis has been appointed to the Assistant Obstetric Physiciancy at St. Thomas's Hospital, vacant by the death of the late Dr. S. Griffith.

WALKER.—Thomas James Walker, Esq., M.B., has been elected Assistant-Physician to the Queen's Hospital, Birmingham.

DEATHS.

ANDERSON.—September 6, at his residence, Clarence-terrace, New Hampton, Middlesex, Dr. Alexander Anderson, formerly of Brompton-row, Knightsbridge, aged 97.

CHEEK.—July 3, at Conoor, on the Neilgherry-hills, George Nicholas Cheek, of the Bengal Medical Service, aged 65.

DOBSON.—August 28, William Coyle Dobson, of Hamilton-place, Highbury, aged 31.

GILLESPIE.—September 1, at 45, Castle-street, Edinburgh, Alexander Gillespie, M.D., aged 84.

HOUSTON.—August 31, at Ardrossan, N.B. John Houston.

KING.—September 3, at Glasgow, Alexander King, M.D.

KNOX.—Alexander Knox, M.D., Staff-Surgeon (half-pay.)

MACINTOSH.—Recently, John Macintosh, M.D., late Surgeon to the Royal Artillery.

NELIGAN.—August 28, at Athlone, William Hodson Neligan, M.D., aged 62.

PERKINS.—At Brighton, Horatio Perkins, M.R.C.S., Esq. He was one of the oldest Members of the College, his diploma bearing date 1792. Aged 90.

ROWE.—August 20, John Rowe, of Wimborne, Dorset, where he had practised for forty-five years.

SIMPSON.—August 28, at Haslar Hospital, John Simpson, Surgeon, R.N., aged 39.

THORNTON.—August 23, at Toronto, Canada, Thomas Thornton, M.D., formerly of Carrickmacross, Ireland, aged 45.

WHIPPLE.—August 28, at Compton, near Plymouth, Frederick James Whipple, Surgeon, R.N. (1847).

M. FLOURENS has been raised to the rank of Grand Officer of the Legion of Honour.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.—The Library will re-open on Monday next, the 12th instant.

TWENTY-TWO deaths from small-pox occurred last week in London. How long is this needless mortality to be permitted?

THERE is at length a *talk* of the erection of barracks on the Himalayan ranges, where the climate throughout the year is as cold and bracing as in England.

MRS. ASSHETON SMITH has left a legacy of £1000 to each of the following charitable institutions,—namely, the Salisbury, Winchester, and Bangor Infirmarys.

MR. SYME, of Edinburgh, has been elected Foreign Associate, and Mr. Henry Thompson, of London, Foreign Correspondent of the Parisian Surgical Society.

THE Council of the Society of Arts have again under consideration the propriety of taking steps to hold a second Great Exhibition of the Industry of all Nations in London in 1862.

During forty years of practice Dr. N. Smith, in America, never found assafoetida and aloes fail in the treatment of ascarides. He seems to have used the remedies in the form of tincture given internally.

THE Town Council of Berlin has just subscribed £1600 to a foundation in honour of Humboldt, destined to afford aid to learned men and travellers in the prosecution of the studies to which he devoted his long life.

THE CHOLERA is said to be spreading along the shores of the Baltic. Its presence in Dantzic is officially acknowledged, as well as in Osnabruck and Elberfeld, and it is reported to have made considerable ravages at Hamburg.

A FACULTY OF MEDICINE at St. Francisco has announced its existence by a prospectus. It at present gives the names of six chairs,—Pathology, Chemistry, Physiology, Anatomy and Surgery, Materia Medica, and Medical Jurisprudence.

A CARRARA marble slab has been placed lately over the door of the house at Mahon, in which Orfila was born, with this inscription: "Le Docteur don Mateo Orfila y Rotger est né dans cette maison, le 24 Avril, 1787."

THE PLEURITIC FRICTION SOUND discussion still goes on at Paris. Its existence has plenty of defenders. We can hardly fancy that such a question would ever have been discussed at all, had not such a celebrity as M. Trousseau turned heretic in his opinions regarding it.

INFANT MORTALITY IN NEW YORK.—Of the large number of 710 deaths in the city of New York during the week ending August 25, the alarming proportion of 442 were of children under two years of age, and of that number 145 died of cholera infantum, and 43 of diarrhoea.

The municipality of Lisbon has ordered 200 silver medals to be distributed amongst those who distinguished themselves by acts of devotion and charity in 1857, at the time when yellow fever was raging in that capital. The medals are to be worn attached to a large yellow ribbon.

A PRIZE of £100 has been placed at the disposal of the Council of the Society of Arts, by Sir W. C. Trevelyan, Bart., to be awarded for "the best Essay on the Applications of the Marine Algæ and their Products, as Food or Medicine for Man and Domestic Animals, or for Dyeing and other Manufacturing Purposes."

THE Dowager Madame d'Harcourt has left, among other singular legacies, 2000 francs annually for life to her Physician, provided he visits the present abbess of Val de Grâce, twice every week so long as she is in health, and four times a-day, when she falls sick. The French code proscribes legacies to doctors; so it is doubtful whether this one will hold good.

A FRENCH journal writes:—"Many English journals are at present occupied about Mistress Blackwell Doctoress in Medicine, who has been delivering in England lessons on the Rights of Woman. It does not seem, from what we have read, that this *rare species* finds the same respect as the other."

A FRENCH TALE.—The *Gazette de France*, speaking of the fact of M. Larrey having his horse shot under him at Solferino, adds that the animal would have perished from loss of blood, had not the Doctor applied his science on the instant, and arrested the hemorrhage in the very heat of the action, and amidst a storm of projectiles!

M. BANIOT recommends a simple plan for ascertaining whether the alcohol in any specimen of wine is natural to it, or has been artificially mixed with it. If natural to it, the alcohol will not take fire when the wine is heated at a less temperature than between 70 to 80 degrees Centigrade; but when added, it inflames at 45 degrees.

To the thousand remedies which have been recommended as useful in preventing the formation of cicatrices from small-pox pustules, glycerine has been added. Dr. Posner tells us that he applied it very frequently and very successfully a great number of times during the epidemic of small-pox which reigned at Berlin in 1858.

REMEDY FOR THE BITE OF MAD DOGS.—A Saxon forester, named Gastell, now of the venerable age of eighty-two, unwilling to take to the grave with him a secret of so much importance, has made public in the *Leipsic Journal* the means which he has used for fifty years, and wherewith he affirms he has rescued many human beings and cattle from the fearful death of hydrophobia. Take immediately warm vinegar or tepid water, wash the wound clean therewith, and then dry it; then pour upon the wound a few drops of hydrochloric acid, because mineral acids destroy the poison of the saliva.

The *Nord* informs us, that a Doctor of Medicine who possessed a European reputation, lately died at Darmstadt. This Doctor was a female—one McCharlotte Heidenreich. She devoted her attention to youthful mothers. Not only was she called into England in 1819, at the time of the birth of Queen Victoria, but a number of ducal and princely heads in Germany have had recourse to her art.

PINEL states, in letters of his lately published, that he was enabled to live decently upon what he obtained by the translation of English works. "At this moment," he says, "I am engaged in the translation of Cullen's 'Institutes of Medicine,' for which I receive 1000 francs. I would give up physic altogether, if it were necessary for me to be running about all day in the streets. I wish for only a very small practice—to see little and observe much."

THE following lines are inscribed on the pedestal of the statue of Jenner, in France. The journal which quotes them drily observes, "We prefer the statue."

Salut et gloire à toi, Jenner, au nom des mères,
Dont l'œil avec amour veille sur des berceaux !
Tu fus leur bon génie, et tu les rendis fibres ;
Car grâce à toi leurs fils resteront toujours beaux.
Ta vaccine à nos cœurs parlera le langage
Des merveilles de l'art et de la charité,
Et tous, pour te bénir, nous dirons d'âge en âge :
"A Jenner l'immortalité !"

In support of his assertion that the number of still-born children has increased in France of late years, Dr. Deville, quotes the *Moniteur* of the twelfth year of the Revolution : "In the tenth year the 108 Departments of France reckoned 1,097,159 children born alive, and 29,202 born dead; or in other words, 266 dead for 10,000 viable children." "In 1852 to 1856," says the *Annuaire de la Statistique*, "the proportion was 437 dead to 10,000 viable." So that it seems in the course of half a century the dead births have increased 64 per cent. in France.

THE FOUNDER OF ST. BARTHOLOMEW'S HOSPITAL.—It was the jester, Rayer, who founded the Priory of St. Bartholomew, in later times transformed into a Hospital for the sick poor : Rayer, or Rahere, was a bright example of the genus monk. He was bright in manners and prudent in business, and in "spectacles, meats, plays, and other courtly motleys," haunted the King's palace and won the Royal favour, and turned all advantages to account for the good of his priory and his fair; of which the first remains in the form of a Hospital, one of the noblest institutions of the land, and the other has been trampled out as a plague-spot in our civilisation.

AN ENTHUSIASTIC FEMALE.—Dr. Closmadeuc was suddenly called to a convent to attend upon a young female, who it was said was in an attack of epilepsy. The Doctor finds his patient half-asphyxiated; and therefore at once bled her largely, and put mustard poultices to the calves of her legs. The patient hereon became more calm, and coughed and spat up somewhat, and made slight gesticulations. And then the Doctor learnt that under the influence of exaggerated scruples, she inflicted various penances on herself; she ate earth; and some of her companions in solitude had seen her swallow medals (holy ones, of course). He could not open her mouth, however, so he gave tartar emetic; and at the first dose the patient made an effort to vomit, whereon appeared between her teeth the end of a cross seven centimetres long; this was laid hold upon, and then was drawn forth from her mouth an enormous rosary two metres and twenty centimetres long, having seven medals stuck on it at intervals !—*Gaz. des Hôp.*

LUNATICS IN THE GOOD OLD TIMES.—It is impossible for us to imagine the condition of Lunatic Asylums before the days of Pinel. Dungeons, wet and infected, without light and air, called *loges*, containing a wretched mattress or some rotten straw strewn on the ground. Human beings naked or covered with rags, almost always furious, chained to each other, and shut up in these abodes of desolation and misery—actual tombs, out of which they came to be carried to their last dwelling place. Their brutal keepers, selected from those who had been condemned to punishment, treated them like brutes, and used them most barbarously, abusing and ridiculing them, striking them cruelly, and continually fighting with them, throwing them their deficient and coarse food, keeping their water from them when thirsty, and

their clothes when cold; exposing them to the jokes of visitors. Such were the inhabitants of Bicêtre at that time,—wretched beings thought incurable, abandoned by their friends, deprived of all Medical treatment, pale, wasted wallowing in their own filth, groaning under the weight of the chains which tore their wasted limbs, raving under the horrible sufferings to which they were subjected by their inhuman keepers.—*Gaz. Hebdo.*

AN ORIGINAL LIBRARIAN'S REPORT.—Dr. Coale, Librarian to the Massachusetts Medical Society, "begs leave to make his annual report. In doing this he must premise he cannot say much, because he has not much to say. During the past year there has been the average number of omissions to inform the librarian of assessments having been paid, and of residences having been changed, and, consequently, the average number of complaints that books and periodicals have not been received. The result of these neglects and omissions the librarian has set himself diligently to correct, and going about his labours with a strong determination to please everybody in general and himself in particular, he flatters himself that he has succeeded in both aims. . . . The remarkable, not to say startling, event of the year, one that will make this an *annus mirabilis* in the history of the Massachusetts Medical Society, is the completion of 'Copland's Dictionary.' Through twenty-five years the publication of the work has been protracted. Empires have fallen, others have arisen on their ruins, and these in turn have given way to others; the scientific and political aspects of the globe have been changed many times and oft; but Dr. Copland, with continuous and unflagging pertinacity, has progressed steadily through the alphabet. All things sublunary, or to put it more strongly, all things finite, have a termination, and to-morrow, men, who, in the prime of life and in the full flush of youthful hope, consulted the letter A, may, in grey hairs and spectacles, improve their knowledge in all Medical subjects commencing with U, V, W, X, Y, and Z. . . . The library is in good condition, but the permanent additions to it have been very few; but as none of the books are read, we cannot regret deeply that there are no more to read."

MISS MARTINEAU ON INFANT MORTALITY.—The fact is proved that in England 100,000 persons die needlessly every year, and of this number 40,000 are children under five years of age. Of all the infants born in England, above forty per cent. die before they are five years old. Yet, what creature is so tenacious of life as a baby? Those who know the creature best say they never despair of an infant's life while it breathes, and most of us have witnessed some recoveries which are called miraculous. There is also no creature so easily manageable as an infant, so easily kept healthy and happy, merely by not interfering with the natural course of things. How, then, can this prodigious amount of killing go on in a country where infanticide is not an institution? It is precisely because the natural course of things is interfered with that infants die as they do. Nature provides their first food; and if they do not get it, whose fault is it? The great majority of mothers must be naturally able to nurse their own infants. Poor women do it as a matter of course; and, if gentlewomen did it as simply and naturally, that one change would largely modify the average of deaths. Gentlewomen may not be aware of this because the doctor is complaisant in bringing a wet-nurse, and the indolent mother is unaware that her own infant probably suffers, though it does not die, from being put to the wrong breast, while it never enters her head that the nurse's baby probably dies. If, of the forty per cent. of English infants who die yearly we could know how many are the children of wet-nurses, the fact might startle the fine ladies who suborn the mothers, and might bring no small amount of reproach on the complaisant doctors. When the kind of food is changed, nature is still far from being deferred to as she ought.

HYDROPHOBIA.—The Academy of Medicine of Turin is at present investigating measures best suited to prevent the occurrence of this terrible disease. In France it was thought some years ago that the end would be gained by raising the taxes on dogs, and so diminishing their number. M. Lobligois gives on this head some very interesting details. He states that, since the tax on dogs was established, the number of cases of hydrophobia have considerably increased at the

Veterinary School of Lyons. He attributes the fact to the chaining up of the animals, and to the state of forced continence in which they are kept. "The fact," he writes, "of the immunity of dogs in Constantinople has been contested. M. Bernis, Head Veterinary Surgeon of the army in Africa, asserts that hydrophobia is not very rare in our colony in Algeria. M. Magne, Professor at Alfort, knew a well-authenticated case. These two distinguished Veterinary Surgeons do not, however, furnish any document which invalidates the general assertion of M. Hamont. M. Hamont, who has directed for fourteen years the Veterinary School at Cairo, admits the existence of cases of hydrophobia in Egypt, but asserts that they are never observed except in European dogs, who have afterwards inoculated indigenous animals. In support of this assertion, M. Lobligois cites a fact signalled in a letter addressed by M. Sacc, Professor at Wesserling, to the Society for the Protection of Animals. Hydrophobia is not known on the Mussulman bank of the Danube, where the dogs wander freely about; but it is not very uncommon on the Hungarian side in dogs of the same race, who are chained up in farms, etc." In consequence of these considerations, and of this asserted fact, that hydrophobia is excessively rare in female dogs, M. Lobligois advises that owners of dogs should keep only bitches, or castrated males, or dogs of both sexes; and that if they choose to keep males, they "ought not to impose upon them continence, but leave them to indulge in their traditional *cynisme* , and not chain them up."

HYGIENIC TREATMENT OF DIABETES.—M. Bouchardat, in his treatment of this disease, advises that remedial agents should not be resorted to until after a full and complete trial has been made of all the plans which he suggests in the way of diet, exercise, and clothing, etc. The following are the rules which he prescribes in carrying out this object:—*Food*: The first rule to observe in the dieting of a diabetic patient is the suppression, or diminishing of the quantity usually taken of feculent foods; this forms the basis of the treatment. Bread, pastry, rice, maize, and other grains, are to be proscribed; so, also, radishes, potatoes, arrowroot, vermicelli, semola, maccaroni, haricots, peas, lentils, beans, chestnuts, preserves, etc. The exclusion of saccharine food should be even more rigorously enforced. The following are the principal of the foods which may be taken:—every kind of meats, boiled, or grilled, or roasted, or dressed with any kind of sauce to stimulate the appetite, provided there be no farina admitted. Liver and gelatinous parts should not be taken. Fishes of every kind may be taken; so also oysters, lobsters, frogs, prawns, etc. Eggs are highly useful. Milk is prejudicial, but fresh cream may be taken. Cheese also is useful. Many kind of legumes may be admitted, but in their preparation much oil, or butter, or fat should be used; the yolk of egg and cream replacing farina in the sauces. Truffles and mushrooms are good. From time to time moderate quantities may be indulged in of apples, pears, cherries, strawberries, but without any sugar, and when the urine is free from sugar. For seventeen years M. Bouchardat has employed gluten bread, and its utility cannot be denied. He does not consider this bread as the remedy for diabetes, but only as a means of replacing bread without inconvenience to the patient. Some, though only very few, patients support well the deprivation of bread, and for such persons gluten bread is not required. *Drink*: Wine is of great importance; and M. Bouchardat considers that the replacing of the feculent food by alcoholic drinks is as important as the abstinence from feculent foods. He prefers the red Burgundy and Bordeaux wines; but all red wines, which are more astringent than sweet, do equally well. In the twenty-four hours he gives a *litre* or more. Beer is very bad on account of the dextrine in it. Sweet liquors are proscribed, but a *petit verre* of rum or brandy is admissible with the chief meal of the day. Coffee, also, is useful—of course without sugar—brandy or cream being added to it; but all drinks should be taken in great moderation. Bordeaux wine allays the thirst of the diabetic better than any other liquid. Lemonade, etc., which are taken with so much avidity, are prejudicial; they do not allay thirst better than water, and they in part saturate the free alkali of the blood. M. Bouchardat utterly proscribes their use. Patients should also eat moderately, both to prevent indigestion and to favour the return of the stomach to its natural size. As regards *Clothing*: Chills are always hurtful,

and flannel should be therefore worn, constantly, and over the whole body. *Exercise* should be taken as soon as ever the patient is strong enough; the amount of it being regulated by the strength of the patient. The regimen prescribed ought to be given up, even when the sugar has disappeared from the urine, only very gradually. In such case, the quantity of the caloric foods should be increased. Normandy butter and cod-liver oil should be given when baths or sea-bathing is resorted to.—*Clinique Européenne*.

CONVICTION UNDER THE NEW MEDICAL ACT.—This was a prosecution instituted by the Thorne and Goole Medical Registration Association. The case was heard at the Snaith Petty Sessions on Thursday, the 25th ult. before John Wells, Esq., and J. Egermont, Esq.; Mr. Dalby, Solicitor, of Goole, appeared for the prosecution, and Mr. Clough, Solicitor, of Pontefract, for the defence. Two informations were laid against the defendant, one Thomas Firth Dewhurst, *alias* "Dr. Firth and Co., Consulting Surgeons 6, Park-terrace, Goole." The first case, which was for wilfully and falsely assuming the name and title of a Physician, in the month of August, was adjourned in consequence of the absence of defendant's boy, who had been summoned, but did not appear, the prosecution consequently could not succeed in connecting the defendant with the bills, "Dr. Firth and Co., Secrecy, Cured in a few Days," etc., etc., and the various other bills exhibited before the Bench, and with which the whole country for miles round was placarded. The defendant had resided in Goole about two years. As a conviction was obtained in the second case, the first was afterwards withdrawn. The second information was for wilfully and falsely assuming the name and title of a Doctor of Medicine in the month of June last. R. Gillard, Esq., said he was a Surgeon at Thorne, and the Honorary Secretary of the Thorne and Goole Medical Registration Association; he produced a printed copy of the Medical Register, had examined it, and the defendant's name was not there; he also presented several bills to the magistrates, which he had taken down from walls, boards, and other places, on one of which was "Dr. Firth and Co." In the greater part of the bills the somewhat ingenious dodge of cutting out the letter *r* in the word Dr. had been resorted to. Mr. Clarke, a respectable tradesman of Goole, proved he had taken down two bills, with "Dr. Firth and Co.," which he presented to the Court, had seen defendant's boy paste similar bills on different places. Mrs. Lister, of Goole, said she had taken a child to Dr. Firth's residence, and asked for Dr. Firth; the defendant appeared, and prescribed for the child; she, witness, paid for the medicine. In answer to a question whether she knew the defendant, on looking round the Court she pointed him out to the magistrates. Hannah Green, of Rawcliffe, said the defendant came to her mother's house, and left a bill similar to those produced; that the bill had "Dr. Firth and Co." on it; her mother read it; the Doctor called again in a few days, and told her she had the liver complaint, for which he gave her some pills; she paid him for them; this witness also pointed out the Doctor in the Court. An old man, a porter to the Goole packets, said he had gone to the defendant's house in consequence of seeing these bills, and asked for Dr. Firth; the defendant came, and said he was the Doctor. Mr. Clough contended that there was no case against his client, saying that as it was a Penal Act under which the defendant was charged, the magistrates were bound to take it literally, and the precise words of the section were Doctor of Medicine, and that the mere word Dr. meant anything or nothing; he, the defendant, had never said that he was a Doctor of Medicine. The magistrates (with E. E. Clarke, Esq. Solicitor, their Clerk) retired to consider their decision. On their return, the chairman said the magistrates considered the charge proved, and convicted the defendant in the penalty of £5, and £1 1s. costs. Mr. Clough applied to have the penalty reduced, as it was the highest that had yet been inflicted; he had not addressed himself to the Bench on the amount of the penalty, as he had not expected a conviction. The magistrates refused to reduce the amount, the Chairman saying that they considered it a very gross case, and the whole neighbourhood for miles round was placarded with these bills, some of them of a very indecent character; and he might remark that he had himself warned the defendant.

VITAL STATISTICS OF LONDON.

Week ending Saturday, September 3, 1859.

BIRTHS.

Births of Boys, 878; Girls, 833; Total, 1711.
Average of 10 corresponding weeks, 1849-53, 1437.4.

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29.600 in.
Mean temperature	66.4
Highest point of thermometer	82.5
Lowest point of thermometer	44.5
Mean dew-point temperature	43.1
General direction of wind	S.W.
Whole amount of rain in the week	0.33
Amount of horizontal movement of air in the week	310 miles.

TO CORRESPONDENTS.

M.D. should address his questions to the Registrar of the Medical Council.
W. W.—It is probable that the appointment would be confirmed, but not certain.

Dr. Stone's "Cases of Chorea treated by Sulphate of Zinc" will appear next week.

An Old Hospital Physician; A Reader, &c.—The Stamp Duty on Licences has been remitted, but not on Degrees.

A first-rate Classic will find all the information he requires in our Students' Number, which will be published on the 24th inst.

Mr. Holberton.—According to the Medical Witness Act, the fee for each Medical witness attending a Coroner's inquest, in obedience to the official order, is one guinea, and another guinea if he has been desired to make a post-mortem examination. For attending Courts of Assize, Oyer and Terminer, Gaol Delivery, General Sessions of the Peace, or any other Court, having power to allow costs, expenses, and compensation to prosecutors and witnesses, the allowance fixed by the Secretary of State in March, 1858, for prosecutors and witnesses, being members of the Profession of the Law or of Medicine, attending to give professional evidence, but not otherwise, for their trouble and loss of time for each day they shall necessarily attend the Court to give professional evidence, a sum not exceeding £1 1s., and for each night the same as ordinary witnesses, viz., 2s. 6d., and for mileage a sum not to exceed 3d. per mile each way, but where it becomes necessary that scientific persons unacquainted with the facts to be given in evidence, should attend as witnesses in order to state their opinion on matters of science, the allowance to be made to such persons shall be subject to the decision of the Court before whom such persons shall be examined, which may direct such allowance as to such Court may appear reasonable £2 2s. would, therefore, seem to have been all that could properly be allowed for the two days' attendance. However inadequate the fee may be, a Medical witness can claim no increased fee for attending in a case of disinterment, but we believe a Coroner could not compel an unwilling Medical witness to make a post-mortem examination in any case. If one Medical man were unwilling, the Coroner would usually appoint another.

THE BOTANIC INSTITUTE.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—The enclosed philosophical and logical paper seems to have escaped your notice in alluding to "Dr. Beaumont's Specific." I suppose it did not

reach you with the other documents, as I can scarcely think you would consider the highly important and scientific views contained in it unworthy of being reproduced! Copies of all the three papers were laid before me by a Baronet, about a month ago, for my opinion of their value.

September 6, 1859.

I am, &c.

W. D.

"Botanic Institute, 152, Park-lane, Liverpool, 1859.

"SIR.—The Committee of the Botanic Institute have come to a conclusion, after debating for upwards of three months on the subject of Deafness, that the drum of the ear is somewhat like a drum, a musical instrument. There is no sound to the head if you slacken the cord of the said drum. So the gentlemen of the Committee have drawn an inference between the nervous system and the drum of the ear, that if the stomach is out of order the nervous system will likewise be impaired; for every nerve is connected with the stomach and spinal cord; in fact to cure deafness the nerves must be braced to give sound to the drum. To prove this fact, notice a drunken man's hand, for instance; how it trembles after the stomach is inflamed by alcohol!—showing the influence of the stomach on the whole of the nervous system thereby correcting the quality of the contents of the stomach. It will not only strengthen the nervous system, but materially advance the sense of hearing. We have on hand 2000 testimonials of persons who have been cured of deafness and other diseases by Dr. Beaumont's Specific."

MORE ADVERTISING.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I enclose an advertisement which appeared in "Macaulay's Railway Time-table Monthly Advertiser." On examining the "London and Provincial Medical Directory," I find that Mr. Muggeridge possesses, the qualification of L.S.A. only.

September 6, 1859.

I am, &c.

HONESTAS.

"Diagnosis, or a Knowledge of Disease, goes a great way towards its cure. Mr. Muggeridge, Visiting, Prescribing, and Dispensing Surgeon, 46, Minster-street, Reading, gives his advice at home, Prescribes and Dispenses Medicines before ten o'clock in the morning and two in the afternoon, at charges that cannot fail to be appreciated; in nearly twelve years of general practice, he has visited 5000 patients at their own homes, and of that number, and during that period, eighty-five deaths only occurred, from all causes, for which Medical certificates were given, which can be proved by the Registrars, or an average of 7 deaths yearly, or 17 in every 1000 sick patients: compare this with Homœopathic results, in real disease, also with the Registrar-General's return for the population of Reading, sick and healthy, which states that 24 in every 1000 die annually, thus showing a balance in favour of the sick of 7 in every 1000; incontrovertible facts, which cannot be disproved. Mr. Muggeridge begs to observe, that if appointed Medical Officer to any Club, he should consider it his bounden duty to see the members at all hours, and to pay them the same attention as if they were private patients, in visiting them when unable to visit him. Children vaccinated with pure matter. Families attended and supplied with Medicines by contract, and by the year, if desired."

ERRATUM.—In our last week's Journal, p. 248, in a letter on "Grey Powder, its Use and Abuse," for "patent medicine" read "potent medicine."

COMMUNICATIONS have been received from:—

Dr. STRUTHERS; Dr. HANDFIELD JONES; Dr. LEET; Dr. DONNET, R.N., Lisbon; Mr. HEATH; Dr. BISHOP, Devonport; Mr. PELL; Mr. THOMPSON; Mr. WORKMAN; the REGISTRAR-GENERAL; Mr. HOOKER; Mr. AMYOT; Dr. CRUSHGAMMON; Messrs. FIRMIN DIDOT & Co.; Mr. DEAMER; Mr. COLLINS; Dr. KIDD; Mr. RIVERS; Mr. SANDS COX; Dr. A. WOOD.

APPOINTMENTS FOR THE WEEK.

September 10. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's 2 p.m.; Charing-Cross, 1 p.m.

12. Monday.

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

13. Tuesday.

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

14. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopædic Hospital, 2 p.m.; Middlesex, 12½ p.m.

15. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m. London, 1½ p.m.; Great Northern, 2½ p.m.

16. Friday.

Operations, Westminster Ophthalmic, 1½ p.m.

EXPECTED OPERATIONS.

King's College Hospital.—The following operations will be performed this day (Saturday):—

Mr. Lee.—Removal of Breast (two cases). Varicose Veins.

Westminster Hospital.—The following operations will be performed on Tuesday, the 13th inst.:—

Mr. Hillman.—For Prolapsus Uteri; Removal of Tumour from Popliteal Space, and Removal of Necrosed Bone.

Grosvenor Place School of Medicine

No. 1, GROSVENOR PLACE (Adjoining St. George's Hospital).

WINTER SESSION, 1859-60.

LECTURES.

The INTRODUCTORY LECTURE will be delivered on MONDAY, OCTOBER 3rd, at Three o'clock, p.m., by Dr. COCKLE.

General Anatomy and Physiology—Dr. Richardson.

Descriptive and Surgical Anatomy—Dr. Halford and Mr. Lawson.

Practical Anatomy—Mr. Pittard.

Chemistry—Dr. Thudichum.

Principles and Practice of Medicine—Drs. Cockle and Leared.

Principles and Practice of Surgery—Mr. Spencer Wells & Mr. Adams.

FEES.—General Fee to all the Lectures required by the Universities of London and St. Andrews, the Royal College of Surgeons of England, and the Society of Apothecaries, 35 Guineas.

Special arrangements may be made for any one of the Examining Boards.

Prizes and Honorary Certificates will be awarded for general proficiency at the termination of the Session.

The Microscope is used to illustrate the Lectures and Demonstrations. The Dissecting Room and Museum of Anatomy are open to the Students during day-light, where their Studies are superintended by the Lecturers on Anatomy and Mr. Pittard.

The Lecturer on Chemistry has a Private Laboratory, where Students are instructed in Analytical and Physiological Chemistry.

Instruction in Pathological Anatomy is given by the Lecturer on Physiology.

Further information may be obtained at the School, 1, Grosvenor-place; or of Dr. Richardson, 12, Hinde-street, Manchester-square, W.; or at the Residences of the different Lecturers.

London Hospital Medical and Surgical

COLLEGE, Mile-end.—1859-60.—The next WINTER SESSION will commence on MONDAY, October 3, 1859, when the INTRODUCTORY LECTURE will be delivered by Mr. CRITCHETT, at Three p.m.

Nicholas Parker, M.D.—Medicine.

Thos. Blizard Curling, F.R.S., George Critchett—Surgery.

John Adams—Descriptive and Surgical Anatomy.

Andrew Clark, M.D.—Physiology and General and Morbid Anatomy. Practical Histology.

John Sharman, John Couper—Practical Anatomy.

Henry Letheby, M.B. Lond.—Chemistry; Practical Chemistry.

H. J. Barrett—Anatomy and Pathology of the Teeth and Dental Surgery. F. H. Ramsbotham, M.D.—Midwifery and Diseases of Women and Children.

F. H. Ramsbotham, M.D., Henry Letheby, M.B. Lond.—Forensic Medicine.

Herbert Davies, M.D.—Materia Medica and General Therapeutics.

George Critchett—Ophthalmic Surgery.

Robert Bentley, F.L.S.—Botany.

J. Langdon H. Down, M.B.—Comparative Anatomy.

General Fee for attendance on the Medical and Surgical Practice, qualifying for the examinations at the London University, Royal College of Surgeons, and Apothecaries' Hall, and for perpetual attendance on all the Lectures, 84 guineas, payable in two instalments of 42 guineas each, at the commencement of the two first Winter Sessions of attendance.

Perpetual Fee to the Lectures alone, £50.

Students can make special entries to Lectures or Hospital Practice.

Further particulars and prospectuses can be had on application to Dr. Parker, Hon. Secretary, 22, Finsbury-square, E.C.; or at the College.

Westminster Hospital School of

MEDICINE.—The INTRODUCTORY ADDRESS of the Session 1859-60 will be delivered by Dr. RUSSELL REYNOLDS, on MONDAY, the 3rd of October, at 8 p.m.; and after the Address a CONVERSAZIONE will be held, and the PRIZES of the past Session distributed.

The Westminster Hospital was Instituted A.D. 1719, and Incorporated by Act of Parliament A.D. 1836. It contains 175 Beds, and affords relief to about 20,000 Out-patients annually.

HOSPITAL PRACTICE.

Physicians—Dr. Basham, Dr. Fincham, Dr. Radcliffe.

Assistant-Physicians—Dr. Marcet, Dr. Reynolds.

Surgeons—Mr. Barnard Holt, Mr. Brooke, Mr. Holthouse.

Assistant-Surgeons—Mr. Hillman, Mr. Power.

Surgeon-Dentist—Mr. Clendon.

LECTURES.

Descriptive and Surgical Anatomy—Mr. Holthouse.

Practical Anatomy—Mr. Heath and Mr. Gray.

Dental Surgery—Mr. Clendon.

Chemistry—Dr. Marcet, F.R.S.

Surgery—Mr. Barnard Holt, and Mr. Brooke, M.A. F.R.S.

Physiology and Physiological Anatomy—Mr. Power.

Medicine—Dr. Basham.

Botany—Mr. Syme, F.L.S.

Comparative Anatomy and Zoology—Mr. Power.

Natural Philosophy—Mr. Brooke, M.A. F.R.S.

Materia Medica and Therapeutics—Dr. Radcliffe.

Forensic Medicine—Dr. Fincham and Dr. Reynolds.

Practical Chemistry—Dr. Marcet, F.R.S.

Midwifery—Dr. Frederic Bird.

Clinical Lectures.—In addition to the instruction given by all the Medical Officers during their visits, Courses of Lectures on Clinical Medicine and Surgery, in accordance with the new regulations of the Examining Boards, will be delivered during the Winter and Summer Terms by the Physicians and Surgeons.

Clinical Assistants, Physicians' Clerks, and Surgeons' Dressers, are selected from the most qualified Students, without additional Fee.

The Entire Course of Study (including Hospital Practice and Lectures) required by the College of Surgeons and the Society of Apothecaries, may be attended on payment of Seventy Guineas.

Further information may be obtained on application to

F. J. WILSON, Secretary to the Hospital.

King's College, London.—Medical

DEPARTMENT.—The WINTER SESSION, 1859-60, will commence on SATURDAY, OCTOBER 1, 1859, on which day all Students are expected to attend the Introductory Lecture, at Two o'clock.

The following Courses of Lectures will be given:—

Anatomy—Professor Richard Fartridge, F.R.S.

Physiology; General and Morbid Anatomy—Professor Lionel S. Beale, M.B.

Chemistry—Professor W. A. Miller, M.D. F.R.S.

Principles and Practice of Medicine—Professor George Budd, M.D.

Principles and Practice of Surgery—Professor William Fergusson, F.R.S.

KING'S COLLEGE HOSPITAL.

Physicians... { George Budd, M.D. F.R.S. } With care of In-Patients.
R. B. Todd, M.D. F.R.S.
George Johnson, M.D.

W. A. Guy, M.B. F.R.S. } With care of Out-Patients.
Lionel S. Beale, M.B. F.R.S.

Physician for Diseases of Women and Children and Physician-Accoucheur—

Arthur Farre, M.D. F.R.S.

Assistant-Physicians—Charles Murchison, M.D.; Conway Evans, M.B.

Surgeons ... { W. Fergusson, F.R.S. } With care of In-Patients.
Richard Fartridge, F.R.S.

William Bowman, F.R.S.

Henry Lee, F.R.C.S. ... With care of Out-Patients.

Assistant-Surgeons—John Wood, F.R.C.S.; John W. Hulke, F.R.C.S.

Surgeon-Dentist—S. Cartwright, jun.

The Hospital is visited daily. Clinical Lectures are given every week, both by the Physicians and by the Surgeons. The Physicians' Assistants and Clinical Clerks, the House-Surgeons and dressers, are selected by examination from the Students of the Hospital.

SCHOLARSHIPS.—New Students will have the privilege exclusively of contending, in October, 1859, for five Warneford Scholarships—viz., two of £25 per annum, for three years, and three of £23 per annum, for two years. The Examination will commence on the 29th of September, in Divinity, Classics (subjects the same as for the Matriculation Examination this year at the University of London), Mathematics, History, and the Modern Languages.

One Scholarship of £40, tenable for two years; one of £30, for one year; and three of £20 each, for one year, will be filled up in April next, the subjects of the Examination being exclusively Medical.

Further particulars may be obtained from J. Harley, Esq., Sub-Dean of the Department; and a detailed Prospectus will be forwarded by application to J. W. Cunningham, Esq., Secretary.

R. W. JELF, D.D., Principal.

St. Thomas's Medical Session.—

A GENERAL INTRODUCTORY ADDRESS will be delivered by Dr. R. T. DUNDAS THOMSON, on SATURDAY, 1st October, 1859, at Three o'clock p.m., after which the Distribution of Prizes, &c. will take place.

Gentlemen have the option of paying £40 for the first year, a similar sum for the second, and £10 for each succeeding year; or £90 at one payment, as perpetual.

PRIZES AND APPOINTMENTS FOR 1859-60.

Voluntary Matriculation Examinations are held early in October, and Prizes are given in each of the three following divisions:—

1st. In Mathematics, Classics, and Ancient History. The President's Prize of 20 Guineas.

2nd. In Physics and Natural History. A College Prize of £20.

3rd. In Modern Languages and Modern History. A College Prize of £20. To the three most distinguished Pupils for General Proficiency in each year, the following Prizes are awarded:—

FIRST YEAR'S STUDENTS.

1st. The Treasurer's Prize of 30 Guineas. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

SECOND YEAR'S STUDENTS.

1st. A College Prize of £30. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

The Dressers and the Clinical Clerks are awarded to merit, after examination.

THIRD YEAR'S STUDENTS.

1st. A College Prize of £30. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

Clinical Assistants, a Prize of £10, and £5 to the two most meritorious. Mr. Geo. Vaughan's Cheselden Medal. The Treasurer's Gold Medal.

Mr. Newman Smith's Prize of £5 for the best Essay on "Neuralgia."

The two House-Surgeons, the Resident Accoucheurs, and the Dressers, are periodically selected, and are provided with rooms and commons in the Hospital, free of expense.

A Hospital Registrar, at an annual salary of £80.

Students of each year are classed according to their respective total merits in the examinations, and all of the First Class receive Certificates of Honour.

MEDICAL OFFICERS.—Dr. Roots, Consulting Physician; Mr. Green, Consulting Surgeon; Dr. Barker, Dr. J. Risdon Bennett, Dr. Goolden, Mr. South, Mr. Macknurd, Mr. Solly, Mr. Le Gros Clark, Mr. Simon, Dr. Peacock, Dr. Bristowe, Dr. Waller, Mr. Whitfield.

Clinical Instruction is given at stated times by the Medical and Surgical Officers; and a systematic Course of Medical Clinical Lectures, by Dr. Barker. Ophthalmic Surgery, Mr. Macknurd; Midwifery, Dr. Waller and Mr. H. Gervis; Dental Surgery, Mr. Patient; Medical Tutor, E. Clapton, M.D.

Lecturers on Clinical Medicine—Dr. Barker. Medicine—Dr. J. Risdon Bennett. Surgery—Mr. South. Physiology—Mr. Grainger and Dr. Brinton.

Descriptive and Surgical Anatomy—Mr. Le Gros Clark and Mr. S. Jones. Chemistry and Practical Chemistry—Dr. R. Dundas Thomson. Midwifery—Dr. Waller. Practical Midwifery—Mr. H. Gervis. General Pathology—Mr. Simon. Botany—Dr. Bristowe. Comparative Anatomy—Mr. W. M. Ord. Materia Medica—Dr. Peacock. Forensic Medicine—Dr. Brinton. Public Health—Dr. Headlam Greenhow. Anatomical Demonstrations—Mr. Rainey and Mr. W. M. Ord. Demonstrations Morbid Anatomy—Dr. Bristowe and Mr. S. Jones. Microscopical Anatomy—Mr. Rainey.

Students can reside with some of the Officers close to the Hospital.

The Patients are admitted daily at Half-past Nine a.m., and the Out-Patients seen at the same time.

To enter, or to obtain Prospectuses and further information, apply to Mr. Whitfield, Medical Secretary, resident at the Hospital.

Best Iron Wire, prepared expressly by
COCKER BROTHERS, NURSERY-STREET, SHEFFIELD, for
 SURGICAL PURPOSES, as supplied to Professor Simpson, Edinburgh;
 Dr. Churchill, Dublin; Mr. T. Spencer Wells, London; Dr. Bozeman,
 Montgomery, U.S.; and many others.—See Professor Simpson's Lecture
 Medical Times, January 1st, 1859. †

Wines from the Cape of Good Hope.

W. and A. GILBEY'S SOUTH AFRICAN PORT, SHERRY,
 &c. &c., 20s. per Dozen. First growths only. Two samples for 12 stamps.
 Wine Importers and Distillers, 357, Oxford-street, London (W.); 31,
 Upper Sackville-street, Dublin; and 12, St. Andrew-square, Edinburgh.

H. Silverlock's Medical Label Ware-

HOUSE, Letter-Press, Copper-plate, and Lithographic Printing
 Offices, Wardrobe-terrace, Doctors'-commons, London, E.C.

H. SILVERLOCK'S stock of Labels for Dispensing purposes having been
 recently revised and enlarged, now consists of upwards of 800 different
 kinds. Yellow and Green Labels for Drug Bottles, Drawers, &c., at per
 book or dozen: a Book, containing a selection in general use in Surgeon
 or Dispensaries, 10s. 6d. Priced Catalogues of the above may be had, post
 free, on application. Printing of every Description at Moderate Prices.

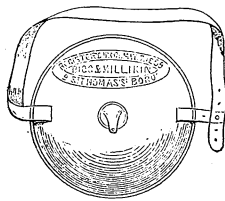

Superphosphate of Iron and Super-

PHOSPHATE OF IRON and LIME. New Remedial Agents intro-
 duced to the notice of the Profession at the Meetings of the Medical Society
 of London, and now extensively employed by the most eminent members
 of the Medical Profession. The Syrup is the most eligible mode of ad-
 ministering these valuable Remedial Agents. Mr. GREENISH will be happy
 to forward a variety of cases which have been furnished to him, where its
 success has been most marked, and which will serve to indicate where it
 may be most advantageously employed.—20, New-street, Dorset-square.

Great Saving in the Purchase of New

MEDICAL GLASS BOTTLES and PHIALS at the NORTH
 LONDON GLASS BOTTLE WORKS, ISAACS and SON (Proprietors).—
 London Warehouses, 24 and 25, Francis-st., Tottenham-court-road, W.C.
 6 and 8 oz., any shape, plain, or graduated } clear { 8s. per gross.
 3 and 4 oz., ditto ditto } blue tinted { 7s. 6d. do.

 tion can be paid to any order not accompanied by a remittance in full,
 made payable in London.—P. and Co. do not supply Green Glass.—Orders
 and remittances to be addressed,

PELLATT & Co.,
 FALCON GLASS WORKS, LONDON.

Blancard's Pills of Unchangeable

IODIDE OF IRON,

Recommended by the Academy of Medicine of Paris,
 And authorised by the Medical Council of St. Petersburg,
 Extensively tried in the Hospitals of France, Belgium, Ireland, Turkey, &c.
 Favouredly noticed at the Universal Exhibition of New York, 1853,
 and Paris, 1855.

"Of all the modes hitherto proposed of administering iodide of iron in
 the pure state, I think Mr. Blancard's the best."—Chemistry applied to
 Therapeutics, by M. Mialhe, Deputy-Professor to the Faculty of Medicine
 of Paris, Pharmacien to the Emperor, 1856, p. 319.

These Pills stand now very high in the therapeutics of every country, as
 may be seen by the above quotations, and also by the numerous scientific
 articles in medical periodicals and works (a).

Being enveloped in a very thin resino-balsamic coating, they present the
 great advantage of not being liable to any deterioration, of having no
 taste, of being small, and not distressing the stomach. As they possess
 the properties both of iodine and iron, they are especially beneficial in
 chlorotic, scrofulous, tubercular, or cancerous affections, as also in
 leucorrhœa, amenorrhœa, anæmia, &c. &c., and they furnish the medical
 man with an excellent means of modifying lymphatic, feeble, and debili-
 tated constitutions. Dose, 2 to 4 pills a day.

N.B.—Impure or altered Iodide of Iron is an unsafe remedy, and may
 even prove dangerous. Only such bottles as bear an electro-plated seal
 fixed to the lower part of the cork, and the signature of the inventor
 placed on a green label, are to be considered as prepared by Mr. Blancard.
 The public should beware of spurious imitations.

To be had at M. BLANCARD'S, Pharmacien, Rue Bonaparte, No. 40,
 Paris. General dépôt in England at M. Gabriel Jozau's, French chemist,
 49, Haymarket, London. In Ireland, at Mr. Vitties, Stevens's Hospital,
 Dublin. In the United States, at E. and S. Fougere, Chemists, 30, North
 William-street, New York. To be obtained retail from the principal
 Chemists.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

West Riding Lunatic Asylum,

WAKEFIELD.—ASSISTANT MEDICAL OFFICER WANTED.—WANTED, at the above Institution, a second ASSISTANT MEDICAL OFFICER, who must be a single man, legally qualified and "Registered." Salary, £100 a-year, with board and furnished apartments.

Applications, stating age and qualifications, accompanied by Testimonials, must be forwarded to me, for inspection by the Magistrates, on or before Saturday, October 15.

By order,
BENJAMIN DIXON, Clerk to the Visitors.

Wakefield, September 6, 1859.

St. Mary's Hospital Medical School.—

The WINTER SESSION will commence on MONDAY, October 3rd, at Eight o'clock p.m., with an INTRODUCTORY ADDRESS by Mr. URE, after which a CONVERSAZIONE will be held in the Museum.

It is a distinctive characteristic of St. Mary's Hospital that the following Medical Appointments are annually conferred upon the Pupils free of every expense. The advantages of FIVE OF THESE APPOINTMENTS far exceed in money value as many SCHOLARSHIPS of Fifty Pounds each. There are four Resident Medical Officers who board (free of all expense) in the Hospital, three of whom are appointed for twelve months, and one (the Obstetric Officer) who is appointed for six months; four Non-Resident Medical Officers; a Medical and a Surgical Registrar; all of whom are appointed by the Weekly Board of Governors on the recommendation of the Medical Committee. Clinical Clerks and Dressers are selected from the best qualified Students. All the above offices are awarded after competition among the qualified Perpetual Pupils of the Hospital.

Physicians—Drs. Alderson, Chambers, Sibson, H. Jones, Sieveking, and Markham. Surgeons—Messrs. Coulson, Lane, Ure, Spencer Smith, Walton, and J. Lane. Physician-Accoucheur—Dr. Tyler Smith. Ophthalmic Surgeon—Mr. White Cooper. Aural Surgeon—Mr. Toynbee. Surgeon-Dentist—Mr. Sercombe.

Further information may be obtained on application to the Dean of the School, who will also furnish the names of Gentlemen in practice in the vicinity of the Hospital willing to receive Pupils to reside with them.

SPENCER SMITH, Dean of the School.

St. Mary's Hospital, August, 1859.

Obstetrical Society of London.—The

next ORDINARY MEETING will be held on WEDNESDAY, Oct. 5, at 8 p.m.; the President, Dr. RIGBY, in the Chair.

The First Session of the Society will terminate in December, up to which time no Entrance Fee will be demanded. The Council beg to intimate their intention of recommending the Society to require the payment of an Entrance Fee of One Guinea, in addition to the Annual Subscription, by Fellows elected subsequently to this date.

Gentlemen desirous of becoming Fellows are requested to apply to one of the Honorary Secretaries.

By Order of the Council, GRAILEY HEWITT, } Hon. Secs.
53, Berners-street. THOS. H. TANNER, }

Dr. E. E. Barron will resume his

MEDICAL and SURGICAL TUITION, adapted to Gentlemen preparing for PROFESSIONAL EXAMINATIONS, on SEPTEMBER 19th; but the Winter Course will not commence until October 4th.

A VACANCY for a HOUSE-PUPIL.

15, St. Thomas'-street, Borough, S.E.

Evening Demonstrations of Anatomy.

—Mr. CHRISTOPHER HEATH, Demonstrator of Anatomy at the Westminster Hospital, will resume his Evening Course of DEMONSTRATIONS and EXAMINATIONS upon the DISSECTED SUBJECT on Wednesday, the 5th of October. The Demonstrations take place on Monday, Wednesday, and Friday evenings, during the Winter Session, from Seven to Nine o'clock, at the Westminster Hospital. Entrance Fee perpetual) Five Guineas.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS and KNEE CAPS, pervious, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTÉ, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Hospital for Sick Children, 49, Great

ORMOND-STREET.—A SERIES of LECTURES on the DISEASES OF CHILDREN will be given every SATURDAY during the months of NOVEMBER, DECEMBER, and JANUARY, by Dr. WEST, Dr. JENNER, and Mr. ATHOL JOHNSON, the Physicians and Surgeon of the Hospital. The First Lecture will be given on SATURDAY, NOVEMBER 12, at 3 p.m., by Dr. WEST.

By order of the Committee of Management,
H. A. BATHURST, Hon. Secretary.

Examinations for the Double

QUALIFICATION of LICENTIATE in MEDICINE and LICENTIATE in SURGERY, to be conferred by the ROYAL COLLEGE of PHYSICIANS of EDINBURGH, and the FACULTY of PHYSICIANS and SURGEONS of GLASGOW, conjointly.

The ROYAL COLLEGE of PHYSICIANS of EDINBURGH, and the FACULTY of PHYSICIANS and SURGEONS of GLASGOW, while they still continue to give their DIPLOMAS SEPARATELY, under separate Regulations, have made arrangements (in terms of the Medical Act), which have been submitted to, and have received the sanction of, the General Medical Council, whereby, after one Series of Examinations, the Student may obtain Two Licences, one in Medicine and one in Surgery.

The object of the joint examinations is to give to Students facilities for obtaining from two separate Bodies, and at less expense, a Double Qualification in Medicine and in Surgery, and thus to enable them to hold various important public appointments, for which, if they only possessed a single qualification, they would be ineligible. Students passing these Examinations successfully will be enabled to enter their names in the Register as L.R.C.P. Ed., and L.F. Ph. & S. Gl.

The College and the Faculty have prepared a Code of Regulations to be observed by Candidates for the Double Qualification, both as regards General and Professional Education and Examination, which may be had on application at the Hall of the Royal College of Physicians of Edinburgh, or at the Hall of the Faculty of Physicians and Surgeons of Glasgow.

The First Examination in General Education under the Code will take place in the last week of October, 1859.

ALEXANDER WOOD, M.D.,
President, Royal Coll. of Physicians, Edinburgh.
JAMES WATSON, M.D.,
President, Faculty of Phys. and Surg., Glasgow.

Edinburgh, 1st September, 1859.

Examinations for the Double

QUALIFICATION of LICENTIATE in MEDICINE and LICENTIATE in SURGERY, to be conferred by the ROYAL COLLEGE of PHYSICIANS of EDINBURGH, and the ROYAL COLLEGE of SURGEONS of EDINBURGH, conjointly.

The ROYAL COLLEGES of PHYSICIANS and SURGEONS of EDINBURGH, while they still continue to give their DIPLOMAS SEPARATELY, under separate Regulations, have made arrangements (in terms of the Medical Act), which have been submitted to, and have received the sanction of, the General Medical Council, whereby, after one Series of Examinations, the Student may obtain Two Licences, one in Medicine and one in Surgery.

Essex and Colchester Hospital.—

There being a Vacancy for a PHYSICIAN in the above Hospital, Gentlemen desirous of filling the Office, are requested to communicate with the Board of Governors with as little delay as possible.

Candidates must possess one of the following qualifications, viz., a Diploma of Doctor of Medicine from the Universities of Oxford, Cambridge, London, or Edinburgh, or a Licence to practise from the Royal College of Physicians of London, or from one of the two first-named Universities.

Letters addressed to the Secretary will be laid before the Board at the weekly meeting on Thursdays.

Board Room, Sept. 8, 1859.

By Order,

JOHN LAY, Secretary.

The Bitter-Water of Friedrichs Hall

enjoys deservedly a very high reputation amongst Medical Men on the Continent, and in directing the attention of the Medical Profession in this country to the extraordinary virtues of this water, we can mention here only a few of the chief diseases in which it has been prescribed with the most beneficial results—viz., Diseases of the Stomach and Bowels, especially Indigestion, Loss of Appetite, and habitual Constipation; Enlargement and Indurations of the Liver, with or without Jaundice or Dropsy; Diseases of the Kidney, including Albuminuria, Affections of the Sexual Organs, and the numerous accidents which so many women are subject to at their critical age, and the inconveniences resulting from pregnancy; also Hypertrophy of the Heart, Determination of Blood to the Head and Lungs, Hypochondriasis, and Gout, must be mentioned. One peculiar advantage which this water possesses over most other bitter waters is, that it is given only in small quantities—viz., a wineglassful, either before breakfast or on going to bed; that it may be taken at all seasons, and requires neither a particular diet nor exercise in the open air. Further information, with cases, will be found in Dr. Eisenmann's Monograph of this Water, which may be had gratis at Messrs. A. and R. THWAITES and CO.'s, 147, Regent-street, London, and 57, Upper Sackville-street, Dublin, who have just received a fresh supply of this Bitter-water.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, pering support, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

TRADE MARK.

Brown & Polson's Patent Corn Flour,

preferred to the best Arrowroot. DELICIOUS IN PUDDINGS, CURSTARDS, BLANC-MANGE, CAKE, &c., and especially suited to the delicacy of CHILDREN and INVALIDS.

The Lancet states—"This is superior to anything of the kind known."

Trade Mark and Recipes, on each Packet, 4, 8, and 16 oz.

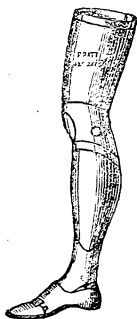

Obtain it from Family Grocers, Chemists, &c.

77A, Market-street, Manchester; and 23, Ironmonger-lane, London.

Crosse and Blackwell, Purveyors in

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloaters Pastes, Strasbourgh and other Potted Meats, and Calf's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of

CROSSE and BLACKWELL, 21, Soho-square.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

"Somerset,

June 20th, 1858.

"DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT in weight, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly,
J. W.

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street."

Newbery's Cod-Liver Oil Cakes.—

"The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered."—Medical Times and Gazette, 12th February, 1859. Packets, 1s. 9d. and 3s. F. NEWBERRY and SONS (Proprietors of the "PULVIS JACOBI VER., NEWBERRY'S"), 45, St. Paul's-Churchyard, London. ESTABLISHED A. D. 1746.

Registered No. 4171,

May 7th, 1859, by BIGG & MILLIKIN, 9, St. Thomas'-street, Borough, MADAME HARRIOTE'S MAMMARY FEEDING BOTTLE, or Artificial Breast, by which an infant can receive its food in the most natural position, and be deceived by its pliable and soft texture. It has many advantages that none but a mother can appreciate.—To be had only at BIGG & MILLIKIN'S, Instrument Makers to Guy's and St. Thomas's Hospitals, 9, St. Thomas'-street, Borough.

Mr. Howard, Surgeon-Dentist, 52,

FLEET-STREET, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without Springs, Wires, or Ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR or DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed Teeth stopped and rendered sound and useful in mastication. 52, Fleet-street. At home from Ten till Five.

Carriages, New and Second-hand, of

superior style, sterling quality, and finest finish at reasonable rates, for cash, credit, job, or exchange. Circular of prices on application. Credit given when required. Buyers should take carriages on trial, with power to purchase by yearly payments, and thus prove them.

OFFORD'S PATENT MEDICAL MAN'S BROUGHAM MANUFACTORY, 79, WELLS-STREET, OXFORD-STREET.

Or SACCHARATED CAPSULES.—Copaiba and Cubebs are, doubtless, the best remedies, but these drugs are of a repulsive taste and odour, and occasion colicky pains, nausea, and gastric disturbance. M. Jozeau has succeeded in rendering these valuable therapeutic agents perfectly innocuous, by increasing, in his Copahine, all the curative properties. This preparation has been adopted by the Paris Academy of Medicine, after more than a thousand trials in Paris, and the different London Hospitals, viz., St. Thomas's, Guy's, and St. Bartholomew's, under the care of Messrs. Lloyd, Poland, and Le Gros Clark. "Lancet," Nov. 6, and Dec. 10, 1852. The Copahine, which is in form of a pretty pink sugar-plum, effects a cure in about six days, either in recent or chronic diseases. 100 Capsules, 4s. 6d. at G. JOZEAU'S, French Chemist, 49, Haymarket, London; 22, Rue St. Quentin, Paris; and all the most important Chemists.

H. Silverlock's Medical Label Ware-

HOUSE, Letter-Press, Copper-plate, and Lithographic Printing Offices, Wardrobe-terrace, Doctors'-commons, London, E.C. H. SILVERLOCK'S stock of Labels for Dispensing purposes having been recently revised and enlarged, now consists of upwards of 800 different kinds. Yellow and Green Labels for Drug Bottles, Drawers, &c., at per book or dozen: a Book, containing a selection in general use in Surgeries or Dispensaries, 10s. 6d. Priced Catalogues of the above may be had, post free, on application. Printing of every Description at Moderate Prices.

NEPENTHE, OR ANODYNE TINCTURE

(OBTAINED EXCLUSIVELY FROM OPIUM),

PREPARED AT THE LABORATORY OF FERRIS, TOWNSEND, LAMOTTE, & BOORNE
MANUFACTURING CHEMISTS AND WHOLESALE DRUGGISTS, BRISTOL.

This preparation has now been for many years extensively used by a large number of eminent members of the Medical Profession with the greatest success. It does not produce headache, stupor, giddiness, prostration of strength, constipation, or the usual unpleasant symptoms attending the use of other preparations of opium.

Nepenthe has frequently been found of essential service in cases of Cancer, where every other opiate has failed.

The following Testimonials received from Medical gentlemen in extensive practice will be regarded as satisfactory proof of its efficacy:—

MEDICAL TESTIMONIALS.

"Having prescribed your 'Anodyne Tincture' in many cases, I would strongly recommend its more general adoption. It is especially useful in the wakefulness common after parturition, or other unusual exertion or excitement. It produces a refreshing sleep, and I do not remember any case in which it has caused the objectionable effects of the other opiate preparations."

"S. Wellington-street, London-bridge, August 14, 1856.

"SAML. GRIFFITH, M.D. London, M.R.C.P.
Consulting Physician-Accoucheur to the Farringdon Dispensary,
Physician-Accoucheur to St. Thomas's Hospital, &c."

"Gentlemen,—I have great satisfaction in bearing testimony to the value of your 'Nepenthe,' in relieving suffering from disease, and in procuring sleep where ordinary narcotics fail or disagree. For several months I have found it very effectual in relieving a great sufferer when all the ordinary anodynes had ceased to benefit, and although the dose has not been increased for months, the relief is as complete.

"Nepenthe' is a very valuable addition to our means of relief, and the Profession and the public are greatly your debtors for it.

"I am, Gentlemen, yours obediently,

"EDWD. BECK, M.D. Cantab.
Physician to the East Suffolk Ipswich Hospital."

"To Messrs. Ferris & Co.

"Gentlemen,—'Nepenthe' has, for some time, been a favourite narcotic with me, and I infinitely prefer it to any preparation of opium now extant. It has proved a remedy of great value in all cases of Neuralgia, Chronic Rheumatism, Hypochondriacism, and indeed all affections where the use of a sedative is indicated; and in Delirium Tremens it is certainly invaluable, performing its operation upon the system, without leaving those distressing feelings consequent upon the use of opiates in general.

"I remain, Gentlemen, your obedient Servant,

"WILL. WOOD BRADSHAW, M.D. M.R.C.P. & F.R.C.S. Lond. &c. &c. &c."

Extract of a Letter from the late G. W. CAINES, Esq. M.R.C.S.

"Please to send me some 'Nepenthe,' as I have a patient with cancer in the breast, with whom no other preparation of opium agrees. I have tried them all."

NEPENTHE may be procured direct from Messrs. FERRIS and CO., 4 and 5, Union-street, Bristol; from respectable Dispensing Chemists throughout the Kingdom; and from the following Agents:—

LONDON:—Mr. Thos. Keating, 79, St. Paul's-churchyard; Messrs. Evans, Lescher, and Evans, 60, Bartholomew-close; Messrs. Savory and Moore, 143, New Bond-street; Messrs. J. Bell and Co., 333, Oxford-st.

MANCHESTER:—Mr. James Woolley.

LIVERPOOL:—Messrs. Clay and Abraham; Messrs. Evans, Son, and Co.; Messrs. Clay, Dod, and Case.

BIRMINGHAM:—Messrs. Southall Bros. and Co.

YORK:—Messrs. Butterfield, Clarke and Co.

NORWICH:—Messrs. Smith and Sons.

PLYMOUTH:—Messrs. Balkwill and Co.

EXETER:—Mr. Geo. Cooper; Messrs. A. Evans and Co.

EDINBURGH:—Messrs. Raimes and Co.

As many imitations of Nepenthe have been attempted, the signature of FERRIS and COMPANY is placed over the cork of every bottle of the true preparation; and none purchased without this protection can be depended upon.

DR. DE JONGH'S
(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

CAUTION.

Serious and repeated complaints having been made of a discreditable system pursued by many Chemists and Druggists of intrusively recommending or surreptitiously substituting a pale, yellow, or coarse brown preparation, when Dr. DE JONGH'S Oil is prescribed, the Medical Profession are respectfully and earnestly solicited to afford their assistance in counteracting and repressing a practice alike injurious to their patients and to the fair repute of a remedy now held in such high and general estimation. In all cases where this Oil cannot be procured from a respectable Chemist, application should be made to Dr. DE JONGH'S Agents,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

By whom any quantity will be immediately forwarded.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. MR. WALTERS has much improved them by making them of *Ætherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

Mr. Power and Dr. Power continue their
LECTURES and EXAMINATIONS daily for the College, Hall, Universities, Army, Navy, and India Board.
The Special Class for the October Examination for M.D. at St. Andrews, is now going on.
The Special Class for the January Examination, at the India Board will commence on Thursday September 22.
Mr. Power prepares Practitioners for the M.D. by correspondence.
Dr. Power receives two House Pupils.
Lecture-room, Exeter-hall, Strand.
September 15, 1859.

Private Establishment for the Insane,
CHURCH STRETTON, near SHREWSBURY. This Establishment is conducted by the Resident Proprietor, Dr. S. G. BAKEWELL, Son of the late Mr. Bakewell, of Spring Vale, Staffordshire.

The Ladies occupy a separate residence, and are under the immediate care of Mrs. Bakewell.

The neighbourhood of Church Stretton is very picturesque and healthy. Its similarity to Malvern is often noticed.

A Carriage is kept for the use of the Inmates.

References can be given to Medical Gentlemen and others in Shrewsbury, Birmingham, Hereford, and throughout Staffordshire.

The Reports of the Commissioners in Lunacy, and of the Visiting Magistrates, will be shown on personal application.

Church Stretton is a first-class Station on the Shrewsbury and Hereford Railway, twelve miles from Shrewsbury.

Scammony Manufactured from the
ROOT.—This Pure Resin may be had of all Wholesale Druggists at s. per lb.

The Medicinal value of this Scammony was fully explained at a meeting of the Pharmaceutical Society, and reported at length in their journal of March last, from which the following are extracts:—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with."

"A. B. GARROD, M.D., F.R.S., F.R.C.P.

"Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens."

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs. M'Andrew's scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power."

"GEORGE JOHNSON, M.D., F.R.C.P.

"Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

Wines from the Cape of Good Hope.

W. and A. GILBEY'S SOUTH AFRICAN PORT, SHERRY, &c. &c., 20s. per Dozen. First growths only. Two samples for 12 stamps. Wine Importers and Distillers, 357, Oxford-street, London (W.); 31, Upper Sackville-street, Dublin; and 12, St. Andrew-square, Edinburgh. Medical Reports, Price Lists, &c. sent post free.

For Infants.—The British Feeding

BOTTLE (registered) may be placed in any position without the Food running out. The supply can be regulated by a stop-cock; being electroplated, it may be instantaneously cleaned. Unlike wood, ivory, or bone, it is impervious to moisture, cannot crack or become sour; there is no possibility of the infant drawing air with the food.

By W. T. COOPER, Pharmaceutical Chemist, 26, Oxford-street, London. Price 7s. 6d., or free to any Railway Station, 8s. 6d.

"PULVIS JACOBI VER., NEWBERRY'S."

Diphtheria, Fevers, Hooping Cough,

&c.—We beg to caution the Profession against imitations of this invaluable Medicine, for so many years prescribed as "Pulvis Jacobi Ver." but to which it is now necessary to add the name "NEWBERRY'S," to secure prescribers against the SUBSTITUTION of articles advertised as James' Powder, BUT WHICH HAVE NOTHING IN CHARACTER, DOSE, OR EFFECT, with the original article, which has been sold by the Newbery Family continuously since its introduction in 1746.

Price, for dispensing: 1 oz. bottles, 9s.; ½ oz. do. 3s. 4d.

Health, Fresh Air, and Pure Water.

—By Her Majesty's Letters Patent.—CONDY'S FLUID contains NASCENT OXYGEN, *nature's true and only purifying agent*; instantly removes all offensive smells; renders impure water fresh, and the air pure; when diluted for use, is of a beautiful colour, not soiling the finest linen; is harmless, and particularly adapted for toilet use, being both refreshing and exhilarating. The Medical Profession have expressed their unqualified approbation of its merits. One gallon makes 200 gallons adapted for use. The cooling, healing, gently stimulating and invigorating properties of this Fluid render it, when diluted, a lotion possessing peculiar and valuable characteristics, whether for bathing the bodies of invalids, incorporating in poultices, or washing and healing wounds. Patronised by the Board of Health, and most public departments, hospitals, schools, and adopted by the India Council in preference to all other disinfectants. In bottles, 6d., 1s. and 2s.; stronger and purer, 1s. 2s. and 4s.

CONDY'S PATENT HEALTH POWDER also contains NASCENT OXYGEN, is odourless, and destroys all smells; in bottles, 1s. 6d. and 3s., and in casks of 1 cwt. 36s.—Wholesale agents, John Bell and Co. chemists, No. 393, Oxford-st. W.; Butler and Crisp, 5, Cheap-side, St. Paul's; Ferris and Co., Bristol.—Chemical Works, Battersea, S.W.

Struve's Seltzer, Marienbad, Vichy,

KISSINGEN, and other MINERAL WATERS.—Under her Majesty's especial Patronage.—ROYAL GERMAN SPA, BRIGHTON, STRUVE'S PUMP-ROOM and PROMENADES, offering every facility for a Course of Mineral Waters, as perfect and beneficial as at the natural springs, are NOW OPEN, for the Thirty-fifth Season. A prospectus, with the highest Medical testimonials, may be obtained gratis, at the Pump-room, or from George Waugh and Co. Chemists to the Queen, 177, Regent-street (west-side), London, and other respectable houses in London and the provincial towns, where orders for Struve's Bottled Mineral Waters continue to be executed.

CAUTION.—The success obtained by Struve's Mineral Waters, owing to their perfect identity with those of the natural springs, has induced several parties to attempt imitations, sold as "Brighton Seltzer," "Brighton Vichy," &c., an analysis of some of which has shown an utter disregard of their true chemical composition. To distinguish Struve's Waters from all others, every bottle has a label and red ink stamp over the cork, each bearing Struve's name, without which name none is genuine, though contained in Struve's old bottles.

Great Reduction in the Prices of New

CLINICAL LECTURES

ON

THE DISEASES OF WOMEN.

By J. Y. SIMPSON, M.D. F.R.S.E.

Professor of Medicine and Midwifery in the University of Edinburgh.

LECTURE XXII.

ON SPURIOUS PREGNANCY.—ITS PROGNOSIS, PATHOLOGY, AND TREATMENT.

GENTLEMEN,—My last lecture was devoted, as you may please to remember, to the consideration of Spurious Pregnancy, or Pseudocyesis, a form of disease which, as I then told you, is in its more complete, but especially in its interrupted or fragmentary forms, by no means rare in practice, and oftentimes very puzzling to the Practitioner. Until you have met with a model case, and perhaps been deceived by it, you would hardly believe how readily you might be led into the mistake of making a false diagnosis. To show you how far the deception may sometimes go, let me state that a lady came to me from the country a few days ago with pseudocyesis, and bringing with her a letter from her Medical attendant, a highly experienced and intelligent Practitioner, who writes me that all the symptoms of pregnancy were at one time very decided, and that he even made himself believe he heard the sounds of the foetal heart on applying the stethoscope to the patient's abdomen. Such a mistake might easily be made by any of us, and the possibility of its occurrence may serve to impress upon your minds the importance of studying and making yourselves practically familiar with all the various means which are likely to enable you to obtain a clearer insight into the nature of the affection. In continuing this subject, now, let me say a word or two, first of all, as to

THE PROGNOSIS OF THE DISEASE.

Spurious pregnancy does not always run a defined and determinate course, and the period of its existence differs in different cases without our being able to assign any particular cause for the variation.

1. The symptoms may be all more or less fully established, and go on unintermittingly for a few weeks or months, and then suddenly break down and disappear. There is a cessation or abortion, as it were, in the course of the disease. In pseudocyesis among the unmarried, this is, perhaps, its most common mode of termination.

2. The symptoms may continue for the space of nine months, and the delusion that a real pregnancy is running its normal course may be kept up till the end of the usual period of utero-gestation, when the series of the phenomena of simulated pregnancy may be concluded by the development of the phenomena of simulated parturition; or, what occurs far more frequently, the disease may be brought then to a more or less speedy termination without the production of any such symptoms.

3. In some cases the train of symptoms goes on uninterruptedly even after the patient has passed the ninth month of her supposed pregnancy, and does not break up till she has reached the tenth, fourteenth, or eighteenth month. I saw a patient to-day who knows that she is labouring under spurious pregnancy, and who has felt movements which she supposed to be foetal for fourteen months. There is another patient coming occasionally to my house at present, with well-marked symptoms of spurious pregnancy, in whom I amputated the cervix uteri some twelve or fourteen years ago, and who since that period has never borne any children, but continued to menstruate regularly up to about eleven months ago. Nine months since, she came to me believing herself pregnant, but as the uterus was quite empty and only somewhat retroverted, I assured her that she was not in the family-way at all. A month ago, however, she returned, averring that I must have been mistaken, because soon after the date of her previous visit, she had begun to feel the movements of the child, which still continued very vigorous and distinct. She

owned, certainly, that the movements were peculiar, and situated much higher up under the diaphragm than she had ever felt them in her real pregnancies, and on examination the uterus was found to be in exactly the same condition as it was nine months ago. Under the use of some of the remedies, of which I shall have to speak immediately, her symptoms have begun gradually to disappear. She is still inclined to aver that there is a child there, and that the child's movements are now lower down in the abdominal cavity, and she still retains a lingering expectation that she will soon be delivered; but her faith in the genuineness of the pregnancy has been materially shaken, and is slowly giving way.

4. The duration of the disease may not be limited by months, for the series of symptoms may continue, and the delusion be kept up for years. I have seen patients living in the belief that they were pregnant, and deluding themselves with vain hopes for long periods, frequently making preparations for their approaching confinement, and still persisting in their belief after oft-repeated disappointments. I have seen the disease go on in this way till the patient's mind became unhinged and she became incurably deranged. There is a lady in an asylum in the neighbourhood of this city who avers that she has inside her a child, which, according to her reckoning, must now have attained the age of, at least, ten years; and the last time that I had occasion to be in that institution, I saw that lady, and was favoured with the old announcement that she was to require my services very soon now. Such cases are, happily, extremely rare; but you do meet with them occasionally, and not in patients within the walls of a lunatic asylum only. It is told that a lady once came to Dupuytren to ask what was to be done in her case, as she had now been in the family-way for fourteen years,—and the great Parisian surgeon gave it as his opinion, that as the boy must be tolerably well grown by that time, the best thing the lady could do was to swallow a tutor immediately, that his education might not be neglected!

PATHOLOGY OF THE DISEASE.

The question as to the pathological nature of this peculiar form of disease is still involved in great obscurity. On making a local examination of the organs of generation, with the expectation of discovering in them the source of all the other changes, we may find these organs in very different states in different cases.

First, We may find the uterus and ovaries affected by some common form of disease. Not unfrequently the uterus is felt to be hypertrophied and engorged; or it may be in a state of anteversion or retroversion; more frequently still, perhaps, there is some degree of ulceration; or some form of eruption on or around the os and cervix; or a slight degree of inflammation in the body of the organ. Or the ovary may be enlarged, or otherwise morbidly affected; as in one of the most perfect cases of spurious pregnancy I ever saw, where the series of symptoms seemed to have taken their origin in an abscess of the ovary. But,

Secondly, Far more frequently we find no trace of uterine or ovarian disease whatever, so that when we do meet with morbid states of the uterus and ovaries as complications of spurious pregnancy, we can hardly recognise them as essential causes of pseudocyesis, but must rather regard them as coincidences; and this all the more, when we recollect how common such diseases are among women who present no such sympathetic constitutional phenomena at all.

Thirdly, When observed in the lower animals, spurious pregnancy has been remarked to occur within a certain period after the time of heat, and to be distinctly connected with that condition; so that in them it is most probably dependent on the physiological change or changes which are at that time set up in the uterus and ovaries. Menstruation in the human female, as you know, corresponds to the phenomenon of heat in the lower animals; in as far, at least, as the process of ovulation and the ripening of a Graafian vesicle is concerned; and I believe that the aggregate of symptoms which we class under the designation of "spurious pregnancy" in women is in some way or other dependent upon the changes which occur in the ovaries and in the uterus at the period of menstruation. When the irritation associated with the normal or physiological changes in these organs is somewhat excessive either in degree or in duration, and is repeated from month to month, the sympathetic phenomena excited at on:

period have not had time, in some instances, to subside before a new stimulus is supplied for their continuation by the recurrence of the menstrual molimen. True pregnancy occurs when the ovulum which escapes from the Graafian vesicle duly meets within the mother's body with male spermatozoa, and as a consequence, a long nine-months' series of local and constitutional phenomena immediately begins to be set up. But the same series of constitutional phenomena, at least, is set up in cases of pseudocyesis when an ovulum escapes, or a reproductive nissus occurs, without any male spermatozoa being present; these phenomena occasionally ending, as we have seen, at the usual extreme term of utero-gestation, in a simulated parturition, or in a kind of *Lucina sine fœtu*, just as in some cases, as among the unmarried, they commence by a kind of *Lucina sine concubitu*, to borrow the language of the old physiologists. Experimental physiology or experimental pathology, if you choose rather to call it so, might probably throw some light upon the subject. It is, at all events, extremely probable that careful observation of the phenomena of the disease as they occur in the lower animals, and a minute examination of the generative organs of some of them, which have been killed when in this state, might lead to the discovery of some appreciable and perhaps morbid condition of these organs which would serve to explain the peculiar phenomena of this disease. Perhaps we would find the *corpora lutea* under such circumstances, tending at least to stimulate in their development and growth the *corpora lutea* of pregnancy. Pseudocyesis, let me again, in conclusion, repeat, though it may sometimes be found to be associated with, and to be exaggerated and continued by uterine or ovarian disease, yet it is not so necessarily or even most frequently; and, further, the local disease which is present may be of the most variable description. So that, on the whole, the disease would seem to depend rather on some disturbance of the ordinary function of the generative organs than on any organic disease of these organs attended and attested by organic changes in their intimate anatomical structure.

TREATMENT OF THE DISEASE.

But although, as Pathologists, our knowledge of the nature and causes of pseudocyesis is so very limited and so very vague, as Practitioners, fortunately, we can do a great deal towards moderating the symptoms and modifying or arresting the course of the disease. For in almost every case there are some indications for treatment clearly presented to us, and by skilfully fulfilling these, we can often succeed in cutting short and dispelling the whole of the phenomena. The principal indications which we require to look to are the following:—

I. Raise or Restore the Standard of Health.

You will find that many of the patients affected with spurious pregnancy are in a state of impaired general health; and, independently of the nausea and vomiting which form part of the special symptoms requiring special treatment, they frequently suffer from indigestion and are often very hypochondriacal. When such is the case, you will give material aid to the action of more specific remedies, and do much towards the cure of your patient, by the administration of bitter vegetable infusions, and of such tonics as may seem to you to be best fitted in each particular case to increase the general tone and vigour of the patient's constitution.

II. Counteract or Cure any existing Uterine or Ovarian Disease.

Though this indication may not require to be fulfilled in the majority of cases of spurious pregnancy, seeing that in most you find, as I have said, no disease of the uterus or ovaries at all, yet when such diseases are present, it becomes a matter of paramount importance to employ all the usual remedies adapted for their cure; and that not because these diseases are of themselves sufficient to lead to the development of spurious pregnancy, but because the irritation they excite in the generative organs, plays an important part, if not in the production of that malady, at least in its continuance, and must be counteracted and controlled by all appropriate means. When the os uteri is ulcerated, we must promote the healing of the sore by the ordinary means and applications; when the organ is inflamed acutely, or as it more frequently is, subacutely or chronically, we must apply leeches and counter-irritants, and employ the various anti-

phlogistics; and so on with all other forms of disease of the uterus or ovaries that may happen to complicate any particular case.

III. Administer Uterine and Ovarian Sedatives.

Perhaps the most important indication that presents itself for fulfilment in every case of pseudocyesis, is to diminish or dispel the irritation which we suppose in almost every case to have been set up in the uterus and ovaries, and which we believe to be the immediate exciting cause of all the other phenomena of the disease. Where this irritation is produced by, or connected with, any recognisable morbid condition of the organs of generation which is amenable to treatment, you must, as I have just stated, have recourse to all the usual remedies for the cure of that morbid state, in the hope that as the local disease is cured the symptoms of pseudocyesis may subside. But where there is no form of appreciable organic change to be detected, as is the case, I again repeat, in the greater number of instances, and where there seems to be merely some functional disturbance attended with irritation or excitement of the uterus and ovaries, then you must have recourse to the use of remedies which are likely to act as direct sedatives of the generative organs. But you may ask me, Have we any such remedies? To such a question I am inclined to reply by stating that I believe we have remedies of the kind indicated in the Bromide and the Iodide of Potassium. I know, at all events, that by the administration of these drugs, and particularly by the administration of the bromide of potassium, I have often succeeded in cutting short the disease, and in causing the train of symptoms to be suddenly broken down, after they had been in existence for a few months only, instead of allowing them to go on and annoy the patient till the completion of a period corresponding to the usual term of utero-gestation, or even for a greater length of time; and this striking effect of these remedies I am disposed to attribute to some specific sedative action exerted by them on the uterus and ovaries. And there are other facts known with regard to the use of these drugs, which go far to confirm the idea that they are possessed of such an action as I refer to. It is on this supposed action, for example, that Sir Charles Locock founds his recommendation of the bromide of potassium for the cure of epilepsy connected with menstruation. There is, as you are aware, a form of epilepsy which is liable to attack females, and more particularly young girls who have just reached the age of puberty, and who become subject to an attack of epilepsy immediately before, during, or after the recurrence of every menstrual period. The onset of the epileptic fits seems to be directly connected with some obscure kind of irritation set up at these periods in the organs of generation; and according to the experience of Sir C. Locock and others, this type of disease, which rarely yields to any other mode of treatment, may sometimes be cured by the use of bromide of potassium, which probably acts by quieting the excitement of the uterus. From these, and such-like observations as to the action of the bromide of potassium on the uterus, I was first led to try the effect of it in cases of spurious pregnancy; and from what I have seen of its efficacy in these cases, I can recommend you very strongly to have recourse to its administration. Give five or six grains of it three times a-day, either alone, or with the addition of from two to three grains of iodide of potassium, and I feel certain that you will often succeed in checking the progress of the morbid symptoms, and so in relieving your patient's mind of much anxiety, and in saving her much needless trouble and prolonged distress. The remedy, let me add, has this further recommendation, that it often proves a good tonic, so that its use is not contra-indicated by any constitutional debility on the part of the patient. The bromide of potassium, let me add, may also be applied locally to the uterus by having it made up in the form of a medicated pessary, and its action may then be aided or supplemented by the admixture of some other sedative, such as morphia or belladonna. Or you may employ other local sedatives. Thus I have sometimes attempted to allay uterine irritation in such cases, and more particularly where it was attended by, or amounted to, a certain degree of neuralgia, by the introduction of a stream of carbonic acid gas, or of that gas combined with the vapour of chloroform, into the vagina, in the manner I explained to you when treating of the palliative treatment of carcinoma of the cervix uteri. Sometimes, also, I have used leeches locally with a similar view.

By the mere application in this way to the uterus of local sedatives you can never, perhaps, expect to produce such a powerful effect on that organ as will lead to a cure of the disease; but I believe you will often find them most useful adjuncts to the internal remedies. But besides attempting to arrest the whole train of morbid phenomena by this kind of radical treatment, there remains, finally, one more indication to fulfil, for you will be obliged in most cases to try more or less to

IV. *Reduce and Relieve the individual Symptoms.*

The two symptoms which chiefly call for treatment in the course of the disease, are, first, nausea and vomiting, which are often as persistent and prostrating in cases of spurious as in cases of genuine pregnancy; and, secondly, tympanitis, which often gives great annoyance from the persistent attendant increase in the size of the patient.

a. *Treatment of the Nausea and Vomiting.*—The sympathetic sickness and vomiting of real pregnancy are, as you know, sometimes, though happily very rarely, so alarming and unmanageable as to oblige us to sacrifice the existence of the embryo to save the life of the mother by procuring abortion. Yet our treatment of symptoms which are thus occasionally so distressing and formidable, is in every instance of an altogether empirical nature, and when the same symptoms occur to such a degree as to call for treatment in any case of spurious pregnancy, they must then also be met by means which are purely empirical. It is just possible, indeed, that if by the application of leeches to the uterus and counter-irritants to the sacrum, aided by the employment of various antiphlogistics, we succeed in subduing some co-existing metritis,—or if, by other appropriate means, we effect a cure of any other co-existing disease of the uterus—our treatment may, at the same time, have the effect of subduing the concomitant sickness. Or the internal administration of bromide of potassium may, perchance, fulfil at the same time the double indication of diminishing the uterine irritation, and dispelling the sympathetic nausea and vomiting. But where this combination of secondary symptoms, namely, nausea and vomiting, really occurs to such a degree as to prove distressing to the patient, as it not unfrequently does, it then demands some specific treatment, and, if one or two methods fail, you may require to put your patient through a course of many different medicines, and to ring the changes on all the drugs that are usually found to act most powerfully and certainly as sedatives of the stomach, before you meet with ultimate success. Sometimes you can moderate and remove this sympathetic nausea and vomiting by regulating the diet of the patient with some degree of strictness, and especially by giving food in small quantities and often, instead of loading the stomach with a large meal, and desiring her to take everything cold, or even iced. External counter-irritation over the stomach is prescribed by some Physicians, and others advise us to apply morphia, etc. to such a surface when the cuticle has been removed by blisters. The internal remedies which are used for allaying nausea and vomiting, whether these phenomena be secondary and sympathetic, or directly due to some disease or disorder of the stomach itself, form a class comprising many and very different drugs; but from their very number and variety you may learn how uncertain each one of them is, and how frequently you may be baffled and obliged to try one after another before you succeed in relieving your patient. You can rarely, if ever, tell at first what remedy will prove successful in any particular case, and you must be prepared, when disappointed with the effect of one, to have recourse to the administration of some other form of sedative. In many cases you will very naturally have recourse, in the first instance, to the use of that most generally efficacious of sedatives—opium. You may administer it, for this purpose, in any of the multitudinous forms of the drug, but always in very small doses corresponding to a fourth, a third, or a half of a grain of the solid opium. It may be given alone; and, perhaps, no form of it is more convenient or more agreeable to the patient than solid opium in the form of a very small pill; or it may be given in the form of powder combined with some other simple sedative such as the sub-nitrate of bismuth, or that other preparation of bismuth which is now coming into fashion, and which is supposed to be more certain and speedy in its action, inasmuch as it is more easily soluble in the juices of the stomach—I mean the carbonate. But there are many patients

with whom opium in every guise and in every combination disagrees, and its use is here attended with this further drawback, that it tends to produce or keep up constipation of the bowels, which is one of those symptoms which you are called upon to control. The vomiting may often be checked and the nausea abated by the administration of one or two drops of prussic acid given in a teaspoonful of water, or in some syrup. When other means have failed, you may sometimes succeed in fulfilling the same indication by the use of two or three drops of naphtha, administered, perhaps, in a teaspoonful of the tincture of hops, which is certainly a very disgusting mouthful, but sometimes apparently of essential service in different kinds of vomiting. The chief objection to the use of this remedy is its disagreeable taste; and this objection holds good also in the case of creosote, another supposed potent and kindred anti-emetic. In administering any of the remedies to which I have referred, you will do well to combine them occasionally with some of the ordinary carminatives, with the view at once of obtaining the effect of that class of medicines, and of covering the unpleasant taste of the special remedy. A less disagreeable agent, or rather, one whose use is positively pleasant, is carbonic acid gas, which is frequently efficacious, and which is always easily procurable. The only caution to be observed in its employment is that you must give it in moderate quantities, and not to such an amount as to produce over-distension of the stomach. You have it always at hand in champagne, soda-water, and the various aerated drinks, or you may order it in the form of an old and celebrated remedy once very extensively employed and known as the anti-emetic “*potion of Riverius*,” which was a draught composed of a solution of a scruple of salt of wormwood (or carbonate of potass), mixed with a tablespoonful of lemon-juice. Effervescing wines are sometimes useful in small doses, both as containing carbonic acid, and as gentle stimulants when the latter are required. Again, you will find that swallowing frequently small pieces of ordinary block ice is often of very great avail in checking vomiting and allaying sickness; and I would recommend you in particular to have recourse to this remedy whenever the patient is at all feverish, or when she suffers from thirst. Salicine is at present, I believe, a favourite remedy with some English Physicians, and is frequently prescribed with success, in the form of a pill, powder, or solution, containing two or three grains of salicine to be taken three or four times a-day. From the class of metallic bodies we derive a number of remedies which are of essential service in cases of sympathetic vomiting. Such are the nitrate and oxide of silver, which, as well as the preparations of bismuth to which I have already alluded, have long been regarded and employed as amongst the most valuable agents we possess in many forms of the affection. In acetate of lead you have another therapeutic agent of occasional value as an anti-emetic, although it is more known and esteemed for its many other important medicinal virtues, than for the property which it possesses of allaying irritability of the stomach and sympathetic vomiting. Some fifteen or sixteen years ago I saw a case, in consultation with the late Dr. Abercrombie and Dr. Argyle Robertson, where the patient, who was in one of the early months of pregnancy, suffered from vomiting to such a degree that she was utterly prostrated; and at last it was thought we should be compelled to induce premature labour, or rather abortion, to save her life. But on the suggestion of Dr. Abercrombie it was agreed before having recourse to this extreme measure, to make trial of the effect of acetate of lead, which was almost the only drug of the class that had not been administered, and, to our great delight, the result of the trial was that the vomiting was immediately restrained and finally checked by the administration of the drug. You may never be obliged to make such an application of this agent; but lest occasion for it should arise, it will be well for you to bear in mind this property of it. I have never seen the vomiting of pregnancy, whether real or spurious, assume the form of hæmatemesis, and I believe that such is an extremely rare occurrence; but I am certain you will excuse me, even although it may thus appear somewhat foreign to the subject in hand, if I take occasion here to inform you of the very striking and satisfactory effect which I lately witnessed from the use of a solution of perchloride of iron in glycerine in a case of vomiting of blood. The patient, whom I saw in consultation with ———— and Dr.

Andrew Wood, had been vomiting up great quantities of coagulated as well as fluid blood, and a great many different remedies had been employed, but without any good result. Having had frequent experience of the effects of the local application of perchloride of iron in arresting hæmorrhage, I proposed that some should be introduced into the stomach, in the hope that by coming into contact with the blood at the vascular orifice, or orifices rather, from which it was escaping, it might lead to its coagulation there, and so prevent its further flow. Accordingly, after a severe fit of vomiting, by which the stomach seemed to be for the time emptied of its contents, the patient was made to swallow a teaspoonful of the concentrated solution of perchloride of iron in glycerine, and from that hour to this, now several weeks ago, she has had no return of the vomiting. You need have no fear, I believe, of any bad consequences from the use of this remedy; at least, I know from experience that a much larger dose than that which I have indicated may be given with perfect impunity. For having had occasion once to carry to a patient's hotel some of the liquid to apply to leech-bites on the cervix uteri, which happened to bleed for an unusual length of time, I left the bottle of the liquid in the patient's room to use if the bleeding recurred. The lady's husband was at the time absent, but being an Englishman who believed that the prime duty of every Practitioner was simply and purely to administer drugs, when he came in and was told that no medicine had been given, but that the doctor had left a bottle behind him, he savagely insisted on making his unfortunate wife swallow all its contents, about two ounces of perchloride of iron solution. I was horrified when I heard of what had been done; but as it turned out, my alarm was groundless, for no bad effect whatever ensued, except that the walls of the patient's mouth felt for a time mercilessly puckered and pulled together.

I have thus named to you a variety of remedial agents, all of which, whether singly or combined, are more or less efficacious for the cure of vomiting; but I have not as yet said anything regarding the drug, which I have found to be, of all individual remedies, the simplest and surest agent that can be administered for arresting the sympathetic vomiting of pregnancy. The drug I refer to is oxalate of cerium, which I have seen successful in curing vomiting in a larger proportion of cases than any other single remedy which I have used; and its good effects are not confined to the forms of vomiting which depend on the sympathetic derangements of the stomach caused by changes, functional or pathological, in the uterus or other organs, but are manifested also in those forms of the disease which are due to different morbid conditions of the stomach itself. Cerium is, as you know, one of those rare and little-known metals which were first discovered in the early part of the present century, and is found chiefly in the Scandinavian mines, combined in small proportions in various minerals. I believe that any of the other preparations of the metal would fulfil the indication equally as well as the oxalate, which is used simply because it is the most easily procurable salt of cerium in the market; oxalic acid being used to separate the cerium from the metal with which it is most generally combined in nature, namely, didymium. The action of cerium on the stomach seems to be that of a sedative tonic, resembling in some degree the action of the salts of silver, and bismuth; and I have seen it succeed in curing the most obstinate cases of vomiting so much oftener, and so much more speedily than any other remedy, that I have come of late to have great faith in its employment. I would not lead you to suppose that by the administration of a quantity of oxalate of cerium you will succeed in curing every case of vomiting, or even in alleviating it in every case; but I am certain that you will find the remedy successful in a larger majority of instances than you will find any other one drug. You may give one or two grains of it, three times a-day or oftener, in the form of pill, or mixed with a few grains of gum tragacanth, in the form of a powder. The vomiting usually ceases after a few doses have been taken; but in some cases it does not abate till the remedy has been persevered with for several days. The effect is sometimes instantaneous. I had a patient some time ago from the west of Scotland, and when her husband first came to ask me to visit her I was engaged and could not go, but after hearing his account of the case, I gave him a prescription for cerium pills, which I desired him to administer to his wife till I could get to see her. He came

back next morning, asking what the medicine was which I had given him, for the effect of it had been like magic. The vomiting, which had been going on almost incessantly, and which nothing seemed to have any power of alleviating, ceased upon the administration of two doses of the cerium. In a previous pregnancy in this patient it had been made a question for a Medical consultation whether abortion should not be induced, to save her from the effects of uncontrollable sickness and vomiting. But the good result is, unfortunately, not always so immediate. One of the earliest cases in which I employed it was in the case of a lady who came from Greenock, when she was pregnant for the fourth time, and had arrived to between the third and fourth months of gestation. For these three or four months she had been always vomiting many times a-day, and often during the night also; and that whether the stomach was empty or full. She could take but very little food, for she always sickened at the sight of it. It had been the same in all her former pregnancies; and on the occasion of the first of them the vomiting was so severe as to bring on a miscarriage, and the patient's own life was despaired of. She got, first of all, one grain of oxalate of cerium, but vomited three hours afterwards. She was then told to take a grain every three hours for a day, and afterwards one grain thrice a-day. This was successful in checking the vomiting, and a few days afterwards she left Edinburgh, feeling quite well, eating her meals heartily, and free from all sickness. Everything had been tried by different Medical men in the West which afforded any prospect of relief, as creosote, prussic acid, bismuth, lime-water, ice, champagne, opium, blisters, etc., but all without effect. The only thing from which she ever experienced any benefit, and that was only very transient and temporary, was calcined magnesia. Yet, as I have told you, it required only a very few doses of oxalate of cerium to produce a perfect cure. Shortly afterwards I saw with Dr. Craig, of Ratho, a case of severe and persistent vomiting in pregnancy, where he had tried everything; but in vain. She, too, was cured by a few doses of cerium. When the propriety of entering this and other modern remedies in the new Pharmacopœia to be published by the Medical Council was lately debated, it was objected that so little of the drug is used that it is not worth while classifying it among the other recognised medicinal agents. But on making inquiry lately at the drug shop of Messrs. Duncan, Flockhart, and Co., in this city, I was told that they had sold as much as sixty-four ounces during the preceding twelve months, and I feel assured that it only requires to be more widely known to make it more extensively esteemed and employed as a general metallic sedative tonic. But it is time that I should proceed to say a word or two as to the

b. Treatment of the Tympanitis.—The enlargement of real pregnancy will be borne by most patients without repining, whereas the distension of the abdomen which forms one of the most deceptive and striking symptoms of spurious pregnancy, is a source of constant complaint; and you will frequently be called upon to do all in your power to relieve it. Although the phenomenon is in a great measure due, as I have already endeavoured to explain to you, to a peculiar action of the diaphragm, as is shown by the flattening of the abdomen, which is seen when the action of the muscles is modified by the influence of anæsthetics; yet there is in most cases a physical cause which operates in some degree towards the production by continuance of the protuberance, and which you can, in some measure, overcome by means of medicaments—I mean, of course, flatulence. For this a variety of remedies may be employed, and perhaps there is none which you can use with more success than the ordinary compound galbanum pills of the Pharmacopœia, of which the patient should be made to take two, twice or thrice a-day. Some Physicians have faith in these cases in pills of ox-gall. The assafœtida pill is sometimes of great service, more particularly in those cases where hysterical symptoms are superadded. Some of the valerianates, such as the valerianate of zinc, may be administered with much advantage. Powdered charcoal used to be a favourite remedy with the late Dr. Abercrombie in many forms of flatulence; and a teaspoonful of that powder administered three or four times a-day often reduces the swelling more rapidly than anything else, more especially in those cases, where there is much flatus present. It acts probably in consequence of the well-known power which charcoal possesses of absorbing great

quantities of different gases. Where there is any degree of irritability of the intestinal mucous membrane, it may be very advantageously given in combination with bismuth; and, perhaps, some calcined magnesia; but the most elegant form in which charcoal can be administered is the charcoal biscuit which is sold by most chemists and druggists. In addition to other means, you will sometimes find it advisable to make the patient wear a binder applied pretty tightly round the abdomen, to afford support to the abdominal walls, and to assist by its pressure in causing absorption of the intestinal gases.

ORIGINAL COMMUNICATIONS.

CASES OF CHOREA TREATED BY SULPHATE OF ZINC,

AS COMPARED WITH OTHER METHODS OF TREATMENT.

By WILLIAM H. STONE, M.B. Oxon., L.R.C.P.
Medical Registrar to St. Thomas's Hospital.

FIFTY-FOUR cases of chorea were admitted into St. Thomas's Hospital during the year 1858. From the similarity of conditions under which they occurred, they offer a fair opportunity for comparing different methods of treatment. They have accordingly been collected with some more detail than could be attempted in the Registrar's statistical report; while, on the other hand, no attempt has been made to give the whole clinical history. Only so much has been preserved as may show the general type and causation of the disorder in the several cases, and tend to establish the efficacy of various medication.

Out of the whole number, fifty were put under the influence of three principal remedies, either singly or consecutively. In sixteen of these, the treatment mainly comprised the exhibition of sulphate of zinc; in twenty, of arsenite of potash; in fourteen, of ferruginous preparations. The remaining four cases have some exceptional modification. It is proposed in this communication to analyse briefly the group of cases treated by sulphate of zinc, and to compare them with the results obtained by other methods:—

Case 1.—M. D., aged 16, female servant. Catamenia regular and somewhat profuse. In other respects health good. Nine weeks before, after a fall, began to suffer from chorea, for which she was out-patient at Guy's Hospital. On admission, not a very severe case; speech and swallowing unaffected; some constipation and headache; aspect anæmic. Never had rheumatism. Took zinci sulph. gr. ij. t. d. for seven days; gr. iv. for seven days, but without much improvement. There was then some spinal tenderness, and a blister was made with liq. vesicatorius over the tender spot, with advantage. She then began to take ferri ammon. citr. gr. x. t. d., and a few days later a daily shower-bath. Under this treatment she rapidly improved, and on the twenty-sixth day of its administration was presented cured, having been in the Hospital altogether forty-two days.

Case 2.—T. F., aged 14, a female, at home. Chorea one month, entirely limited to right side of body; no cause known; suffers much from headache. Some evidence of commencing menstruation, but no complete establishment of the function. Appetite and digestion good; no difficulty of swallowing; speech had been affected at first, but was not so on admission. No history of rheumatism; no cardiac symptoms. Took zinci sulph. gr. ij., t. d. for three days; then gr. iv. for fifty-three days. Occasional purgatives, and a shower-bath daily. Made a slow, but steady recovery in fifty-six days.

Case 3.—M. L. D., aged 11, female, at home. Always a feeble child. Two months previously had some sort of febrile attack, with engorged glands in neck, and herpetic eruptions round the mouth. On recovering from this, was remarked to have choreic symptoms. These had been but slight until five days before admission; they then increased so much as to cause her to fall down, and to interfere much with articulation. Never had rheumatism. On admission she complained principally of weakness and vertigo: no headache; tongue spasmodically thrust out, and speech difficult, but no dysphagia. No cardiac symptoms; no digestive disturbance.

Took zinci sulph. gr. ij. t. d., in infusion of valerian for seven days. The dose was then increased to gr. iij. for three days, then to gr. v. for seven days, then to gr. vj. for eleven days. With this were ordered shower-baths on alternate days, and occasional purges. She made some improvement, but at the end of twenty-eight days was far from cured. She then was ordered liq. arsenicalis m. ij. t. d., c. decoct. cinchonæ, under which treatment the improvement increased rapidly, and after taking this for thirty days, she was presented cured, having been in the Hospital altogether sixty days.

Case 4.—H. C., aged 11, male; at home. A very slight case; no assignable cause; general aspect and functions tolerably healthy; had been ill three weeks. Took zinci sulph. gr. ij. t. d. ex infus. valerianæ for seven days, increased to gr. iv. for two days; but as this quantity caused some sickness, it was again reduced to gr. iij, which was taken for twenty-two days, with steady improvement. He went out cured at the end of thirty-one days. Besides the zinc, a daily shower-bath was given, and occasional purgatives.

Case 5.—G. C.; aged 12, male; at home. Five weeks previously had been in Guy's Hospital, under Dr. Owen Rees, with rheumatic fever. There had been no cardiac symptoms or treatment. He left the Hospital pretty well fourteen days previously, and choreic symptoms came on about a week before admission into St. Thomas's. There was no fright or other cause. On coming in there was some dysphagia, much difficulty in speech, rapid and spasmodic protrusion of tongue. He complained of no pain, but was kept awake at night by the movements. These increased somewhat at first, and were accompanied by stupor and drowsiness. A fortnight later the spinal muscles became firmly contracted, so as to lift him from the bed, and there was then, for the first time, spinal tenderness in the interscapular region. This subsequently became very marked at the lower part of the lumbar region. A week later the choreic symptoms abated slightly; but tenderness became marked in the cardiac region, with much anxiety of aspect, and a to-and-fro sound was audible over the same spot. Pulse 136, large, but compressible; cough becoming troublesome. Soon afterwards inability to lie on the left side, with short breath, set in, the heart's action having become irregular.

Six weeks after admission the chorea was almost gone. Pulse 132, regular. From this time he improved rapidly, though exceedingly anæmic. There remained, however, some thickening and tenderness about many of the larger joints.

At the end of three months he was able to go out, in tolerable health, but with a persistent systolic mitral murmur, and increased impulse over the cardiac region.

On first admission he took zinci sulph. gr. ij. t. d. for ten days; then gr. iij. for fourteen days; then gr. iv. for fourteen days. At this time spinal tenderness was treated by a blister over the spot, and the syrup: ferri iod. was given in 3ss. doses thrice a-day. With this he improved in nervous symptoms, but the heart became affected. After taking the syrup for twenty-five days, the compound iron pill was substituted for eight days, and a mixture of quinine and iron for the three weeks before his going out. He was altogether fifty-six days under treatment. This patient returned to the Hospital a few weeks later with symptoms of cardiac disease, of which he died. On post-mortem, extensive cardiac mischief, principally involving the mitral valve, was found. The spine exhibited no morbid appearances.

Case 6.—E. H., aged 16; female, at home. Catamenia had appeared more than two years before, and had been fully established above a year. Had suffered from slight choreic symptoms rather over twelve months. They began in the head and neck, but had never been very severe. No cause could be assigned for the attack; speech, swallowing, and protrusion of tongue were normal; general aspect anæmic; no rheumatism or cardiac disease. The sulphate of zinc gr. ij. t. d. ex infus. valerianæ was given for seven days, then gr. iij. for seven days, then gr. iv. for thirty-eight days. Tepid shower-bath on alternate days, and latterly aloetic purges were added from menstrual insufficiency with constipation. Under this treatment she steadily improved, and was presented, after fifty-two days, in a fair way of recovery, though not quite cured.

Case 7.—A. W., aged 12; female. A feeble child; no appearance of catamenia; always nervous, and easily frightened; never had rheumatism; four days before admission frightened by "a ghost;" fell down and had spasmodic movements of

the right side of the body. They had somewhat increased, but were not very severe on admission. The bowels were confined; tongue foul; much nausea and retching, but no worms known of; latterly had been subject to short breath, and palpitation on slight exertion. At these times the cardiac action was excessive, but without definite murmur. She took zinci sulph. gr. ij. ter die. ex infus. valerianæ for seven days, with shower-bath daily, and occasional purges. But it caused so much disturbance of the stomach, already irritable, that it was exchanged for the liq. arsenicalis \mathfrak{m} iij. ter die c. decoc. cinchona, with free purgation. This was taken for fifteen days with ease, and rapid amendment. She went out cured after twenty-five days.

Case 8.—S. A., aged 12; female. A second attack. The first had been slight; this was rather severe. It dated from a fright three weeks previously. No great affection of speech, more of swallowing. Tongue steadily protruded. General health good. Never had rheumatism. Took zinci sulph. gr. ij. t. d., ex inf. valerianæ for three days; then gr. iv. for twelve days, with daily shower-bath. Recovered rapidly. Presented in fourteen days nearly cured, though still some movement.

Case 9.—A. P., aged 11; female. Third attack. The first occurred one year, the second five months, previously. Had been ill this time one month. The right side was principally affected. No dysphagia or difficulty of speech; tongue steady; general aspect healthy; bowels regular; appetite good; heart normal; never had rheumatism. She took zinci sulph. gr. ij. ex infus. calumbæ \mathfrak{z} j. t. d. for four days; then gr. iv. for twenty days, with daily shower-bath. Presented cured on the twenty-fourth day. When in the Hospital five months previously she had been treated by syrup. ferri iod. \mathfrak{z} ss. t. d. for thirty-one days, and went out cured on the thirty-second day.

Case 10.—R. H., aged 8; male. Received a "thrashing" from his father for letting fall some article, and immediately afterwards suffered from choreic spasm. Was unable to say whether a spasm caused him to drop the vessel. This occurred four months previously. The attack had not been very severe, most so on the right side. Speech, sleep, and swallowing were unaffected. The tongue was protruded fairly. General health good. Never had rheumatism or cardiac symptoms. Some flying pains, apparently of a neuralgic character. Took zinci sulph. gr. ij. ex infus. valerianæ \mathfrak{z} iss. t. d. for seven days, and gr. iv. for twenty-two days, with daily shower-bath. Improved steadily. Presented cured on the twenty-ninth day.

Case 11.—H. C., aged 11; female at school. Had been ill three weeks previously, and had partially recovered. Ten days back had again become worse. It was stated that the illness consisted of pains and swelling in the feet and arms, with tenderness, the child being at the same time feverish and out of sorts. It was not considered as rheumatism, and had no medical attention. Ten days before admission, the febrile symptoms recurred, with pains in all the limbs. Choreic movements were first noticed in the left side four days before, and had interrupted the sleep at night. They may have been caused by a fright which she seems to have had on that day. When seen, the child was sensible and intelligent. The movements were active and constant. Speech was slightly affected, but the tongue was fairly protruded. Swallowing was not interfered with. There was no evidence of other disease. She took zinci sulph. gr. ij. ter die, ex infus. valer. for five days. The dose was then increased to gr. iv., and this was taken for twenty-one days, with some amendment. At the end of this time she was given a daily shower-bath and liq. arsenicalis \mathfrak{m} iv. ter die. This she took for six days, at the end of which she was presented cured, having been thirty-three days in Hospital.

Case 12.—D. R., aged 14; male. Had had chorea two months; no previous attack; never had rheumatism. No cause assigned for the attack. On admission the movements were extensive, involving many muscles of the trunk; he could, however, walk. Speech was indistinct, the tongue protruded rapidly, and swallowing difficult. As this proved a very obstinate case, a variety of treatment was employed. The sulphate of zinc was given in doses of gr. j. ter die, with inf. valerianæ. After four days the dose was increased to gr. ij.; again, after three days, to gr. iij.; again, after four days, to gr. iv., which dose was taken for three days. As there seemed little or no improvement, the ferri carb. saccharatum gr. x. t. d. was ordered; after four days increased to

gr. xv.; again, after a week, to gr. xx.; and after a like period to gr. xxv. After three days this was raised to \mathfrak{z} ss., which was taken for four days. There was then very little, if any amendment, though the general health was not materially impaired. The liq. potassæ arsenitis \mathfrak{m} iij. bis die was then ordered, with aperients on alternate nights. Tepid shower-baths were also given twice a week. This medicine producing no effect after fourteen days, the ferri carb. saccharatum gr. xx. t. d. was again given for fourteen days, followed by a repetition of the arsenic in the same form for seventeen days. The effect of opiates was then tried. Morphia hydrochl. gr. 1-6th omni nocte, increased regularly to gr. 1-3rd for eleven consecutive nights, but without much effect. The morphia was then administered in the form of gr. 1-6th omni mane, with only partial success. The patient had now been in Hospital from December 31 to April 10 without very great improvement. At this date, however, the ferri carb. saccharatum was resumed in addition to the opiate in the last form, and increased regularly during the month from gr. x. ter die to \mathfrak{z} ss ter die. The choreic symptoms at length began to give way, and on May 1 he was presented cured, having been 123 days under treatment.

Case 13.—M. F., aged 10, female; at home. Had recently had measles, from which she was only partially recovered. Ten days previously began to suffer from chorea. Never had rheumatism. No previous attack. Not a very severe case; swallowing unaffected, speech very slightly so; tongue protruded rather rapidly. After free purgation took zinci sulph. gr. j. ter die ex inf. valerianæ for three days; gr. ij. for four days; gr. iij. for three days; gr. iv. for four days. She was then removed from the Hospital while in a fair way of recovery, having been under treatment sixteen days.

Case 14.—J. B., aged 10, female. Not much history, except that she was a delicate and passionate child, and had had chorea about a fortnight. There was constant motion of both trunk and extremities, but the case was not very severe. Tongue hastily protruded. At first took zinci sulph. gr. j. ex inf. valerianæ ter die for three days; then gr. ij. for four days; then gr. iij. for four days with some advantage. But thirteen days after admission she was attacked with varicella, which ran its usual course, and was followed by some impetiginous irritation of the skin. These did not prevent steady recovery from the choreic symptoms. She was presented cured on the forty-ninth day.

Case 15.—S. L., aged 10, female. Had been ill four months with chorea following a fright. Had never had rheumatism. Heart normal; the symptoms were not very severe; could walk perfectly; speech and swallowing unaffected; tongue fairly protruded; bowels rather costive. At first was freely purged. Then took zinci sulph. gr. j. t. d. for three days; gr. ij. for four days; gr. iij. for seven days; gr. iv. for three days. During this time there was no great improvement. She was then ordered the ferri carb. saccharatum gr. x. ter die. This she took for four days. It was then increased to gr. xv. with the shower-bath daily; continued for seven days. Then increased again to gr. xx. which was taken for fourteen days. With this there was some amendment. She was then given vin. ferri \mathfrak{z} j. and ol. morrhuae \mathfrak{z} j. bis die. With this she made a recovery, and was presented on the sixty-fifth day cured.

Case 16.—J. E. P., aged 11, male. Chorea a fortnight; not very severe; no previous attack; had rheumatic-fever some time before. No cardiac affection; speech and swallowing unaffected; tongue fairly protruded. At first had only cold shower-bath daily for eight days. Then took liq. potassæ arsenitis \mathfrak{m} v. ter die for eleven days, and had a blister on the nape of the neck. With this there was some improvement. The zinci sulph. gr. ij. ter die was then given for seven days with great improvement. It was increased to gr. iij. for three days, and to gr. iv. for ten days, by which time the cure was effected. Discharged after being in Hospital thirty-nine days.

Of the sixteen cases described above, five were males, eleven females. The ages of all are intermediate between eight and sixteen years. Previous attacks had occurred in two cases only. Duration of previous illness had been one week in two cases; two weeks in three; three weeks in three; a month in two; two months in two; three months in one; four months in two, and a year in one case. The attacks were without known cause in four instances, from fright in four, from a fall in one, and followed previous illness in five cases. This illness was in one instance of

febrile character, probably scarlatina; in another measles, and in three others acute rheumatism; of these latter cases one also suffered from cardiac disease, ultimately terminating in death. Two other cases, though not absolutely complicated with illness, showed evidence of being connected with commencing menstruation in a feeble habit. One case was attacked with varicella soon after admission.

As a general statement few of the above cases were characterized by great severity, and of these one, Case 12, which warrants such a description, was more remarkable for its obstinacy than for the acuteness of the symptoms. Accordingly, the graver disturbances of function are comparatively infrequent. Interference with articulate speech, was only observed in six of the cases; dysphagia, to an extent beyond what would naturally follow from spasmodic contortions of the face and hands, only in one case. The rapid and spasmodic protrusion of the tongue, to which much attention has been drawn as a symptom of chorea was observed in five cases. They formed the bulk of those which have already been mentioned for imperfection of speech. The one remaining case had recovered considerably from this latter symptom before admission, and it is probable that, at an earlier period, spasm of the tongue might also have been substantiated. Distinct spinal tenderness was only found in four cases.

Sulphate of zinc was alone exhibited in eight cases. Of these five were cured. Three were improved, though not cured. It was in all cases administered in increasing doses, beginning with one or two grains. Six grains was the highest dose given in the cases before us, though in others four times this amount has been exhibited with advantage, and without vomiting. The shortest effective administration was of twenty-four days' duration among the cured cases; the longest of fifty-six days. The average period of continuing the medicine was twenty-nine days for all the cases; two of which were removed before its full influence had been produced, and one was interrupted by an attack of varicella. In four cases the sulphate of zinc was followed by ferruginous preparations. One of these, Case 5, complicated by rheumatism and cardiac disease must be regarded as an exception. In the other three, Cases 1, 12, and 15, the remedy must be considered to have failed, or only to have succeeded partially; they were all ultimately cured under the administration of iron.

In four cases, the zinc was followed by a course of liq. arsenicalis. In three of these, Cases 3, 7, and 11, this effected a cure; but in the other, Case 12, it was equally ineffectual with the zinc, and recovery took place under the iron treatment. In Case 16, on the other hand, the liq. arsenicalis was exhibited for eleven days in doses of *mv. ter die*, without much effect, and recovery took place after the administration of sulphate of zinc for nineteen days in doses of *gr. iij. ter die*. In two cases, 5 and 13, opiates formed part of the treatment. The former of these required their use principally from rheumatic and cardiac complication; in the latter they seem to have had a beneficial effect; inasmuch as recovery took place under their use combined with iron, though the disease had previously resisted both remedies when exhibited singly.

Besides the principal remedy, thirteen cases had the cold or tepid shower-bath during the treatment. Of the three not so treated, one was confined to bed with subacute rheumatism and cardiac symptoms; the second had only recently recovered from an attack of measles; the third had varicella soon after admission. It is not possible to give any separate estimate of the value of this application in bringing about the cure, though it cannot but be ranked very high. It may be omitted as an element of comparison, from its employment in all cases which did not exhibit a distinct counter-indication.

The general statistics are as follows:—Of 16 cases treated with sulphate of zinc, 13 went out cured, 3 relieved; but 2 of the latter were in a fair way of recovery, and may probably be set to the credit of the medicament. On the other hand, three of those ultimately cured, owed their improvement, partly to ferruginous preparations; and in one case the zinc had no effect whatever. It may, then, be stated generally, that advantage was derived from the zinc in 14 out of 16 cases. The longest stay in the Hospital among these cases was 123 days; the shortest 14; the average stay, 44·6 days.

Fourteen cases were treated during the same period with preparations of iron; all were cured. The longest stay in

Hospital was 161 days; the shortest 6 days; average stay, 44·2 days.

Twenty cases were treated with liq. potassæ arsenitis:—18 cured; 1 relieved; 1 died. The longest stay in Hospital was 55 days; the shortest 6; average stay, 26·3 days. Average stay in Hospital of the 50 cases submitted to three principal remedies, 37·2 days; average stay of all the 54 cases, 35·4 days.

The results of this analysis are somewhat remarkable, as failing to confirm the usual estimate of the value of sulphate of zinc in this disorder. The iron seems to act more certainly, and the arsenic both more certainly and more rapidly than the zinc. The average duration of treatment both with iron and zinc, 44·2 days and 44·6 days respectively, is very similar, and both are above the general average of the whole number of cases, namely 35·4 days; whereas the average stay of the arsenic cases falls as low as 26·3 days. This difference is the more remarkable, as the character of the cases submitted to the arsenical treatment rather exceeded in severity that of the others; and, indeed, the only death recorded belonged to this division.

It remains a question whether the discrepancy between these results and those of some previous well-conducted observations is due to mere accident, or to some real difference in type between cases originating at different times and under dissimilar circumstances.

CASE OF

RECOVERY AFTER STRANGULATED HERNIA AND ARTIFICIAL ANUS.

By JAMES DONNET, M.D. R.N.

Surgeon to the Naval Hospital at Lisbon.

THE following case presents a certain degree of interest: if you think it worthy of a corner in your valuable paper, it is at your service.

Captain E., aged 34, commanding a barque bound for Genoa, put into Lisbon on the 17th June, 1859, afflicted with strangulated hernia, and was placed under the care of Dr. Brandt, the Medical officer in charge of the British Merchant Seamen's Hospital of this city. He had been ruptured in 1854, but for three years after suffered little inconvenience, and only in 1857 first had recourse to the use of a truss, which he wore till within a month of his accident, when he abandoned its use, considering it no longer necessary. He left England in his ship on June 5, 1859, in perfect health. On the 12th, while engaged in the active duties of his profession, the hernia protruded and resisted all his efforts at reduction; the following morning his mate found him suffering very much, and considering his state to proceed from colic, recommended and administered purgatives, among which was croton-oil; no evacuation followed; his sufferings were increased; everything taken by mouth was vomited shortly after; and as the case became a serious one, the ship put into Lisbon for Surgical assistance.

At 11 a.m. of the 18th June I first saw him at the request of and with Dr. Brandt. On examination, we found an oblique inguinal hernia of left side, of the size of a large orange, distending scrotum, and hard as a cricket-ball. On attempting taxis, a slight gurgling sound was heard, but no sensible reduction of the tumour took place. His pulse was 84; he was labouring under great physical and moral suffering; nothing had been retained on his stomach, nor had any evacuation taken place per anum since the 12th June. As an objection was made by the patient to an operation until other means had been tried, pounded ice enclosed in a bag was placed over the constricted part until partial congelation was produced; he was put into a hot bath until he became faint, and chloroform was administered. Under these various agents taxis was tried without effect. At 4 p.m., the patient consenting, we decided upon an operation, and, at the request of Dr. Brandt, I operated. The patient objected to chloroform; we therefore proceeded without its use. The fasciæ were firmly attached to the sac; the sac was opened, and from it flowed a quantity of fluid resembling muddy port wine. The stricture was firm, and was largely divided by a probe-pointed bistoury passed flat along left index-finger of operator, the cutting edge being raised as the knife passed beneath

constricted part. The knuckle of intestine found in sac was of a livid colour; it was, after a careful examination, returned into abdominal cavity. The wound being cleansed, the lips were brought in apposition by four interrupted sutures, assisted by strips of adhesive plaster; a wet compress was placed over this, and a figure of 8 bandage applied.

June 19th.—Has passed a restless night; anxious expression of countenance; is much depressed; vomited some stercoraceous matter; abdomen somewhat tender on pressure, and slightly tympanitic. Pulse 80, small. Tongue covered with a thick white fur.

Vespere.—Stercoraceous vomiting has occurred several times during the day, at noon some beef-tea was given by mouth and vomited shortly after, an injection of beef-tea and wine was administered which he retained for some time; fomentations have been applied to abdomen. At about six p.m. vomiting had passed away. Pulse 80, fuller; had a slight evacuation per anum containing some faecal matter. Has taken and retained some wine.

20th.—Had a better night's rest. Is more cheerful, expresses himself hopefully. Pulse 88, beats with more tone; no return of vomiting; has had four liquid faecal stools; makes water readily, tympanitic state of abdomen has disappeared; complains of some pain about wound. Has taken some fowl broth with relish.

21st.—Much disturbed yesterday by transacting business of ship. Pulse rose to 104 at night, fell afterwards, and slept well. Pulse this morning is 88, all excitement has passed away. Bowels have been opened, stool shaped and of a natural colour; tongue still coated, wound discharges slightly.

26th.—Had been progressing quietly and seemingly well, when at four p.m. yesterday, he was seized with a severe rigor, followed by much heat of skin. He felt easier afterwards, complained, however, of a degree of tension in wound. This morning a quantity of gas, with a fluid matter tinged with bile, came away from wound; the sutures have cut themselves through. On pressing abdomen gently downwards more gas and yellow fluid make their escape through wound. These matters come from intestinal canal; precautions taken to prevent excoriation of skin.

30th.—Has been doing well since last report; a circular opening of the size of a pea exists at upper part of wound surrounded by granulations, from whence the matters from intestinal canal escape mingled with bubbles of gas. The skin around opening is excoriated. Patient takes his broth, jelly, and wine with much relish. Bowels have been opened sometimes with, at other times without, the aid of medicine; stools generally natural and shaped. To-day a portion of sloughy shred appearing at circular opening was gradually drawn away, and was followed by a large quantity of thin yellow fluid mingled with bubbles. Patient lies on back or either side with ease; he is gaining strength.

July 30.—For the last month he has been doing well; the wound has been gradually healing; the artificial anus has con-

tracted itself greatly; the excretion, at times more abundant than at others, has almost ceased; the lint covering opening to-day is very slightly tinged yellow. Is gaining his health fast; has been able to walk about.

August 16.—The matters from intestinal canal ceased exuding on July 30. The wound and artificial anus are now closed; his health and strength are good. He returns to-morrow to England perfectly cured.

This case offers several points of interest:—

1. As the patient, when first seen, objected to an operation, other means were tried, and only when such means had been exhausted was the operation performed. The strangulation had existed six days; it had been aggravated by a repeated and ill-performed taxis, and by the administration of croton-oil and other purgatives; and, in spite of the protracted strangulation and the ill-judged measures resorted to, the patient recovers. Such a case is an encouragement to the Surgeon not to despair.

2. The vomiting of stercoraceous matter following on the footsteps of the operation, abating within twelve hours, and leaving no bad traces behind.

3. The intestinal canal communicating with external wound, and its contents passing by this communication from the 26th June to the 30th July, yet not interfering with the natural evacuations per anum. This artificial anus may have arisen from some gangrenous point of the intestine coming away, opening a communication with external wound, subsequent probably to adhesion between peritoneal surface of intestine and abdominal parietes; the sloughy shred, which was drawn from opening on the 30th June, was followed by a greater flow of bilious fluid, mingled with gas, and no doubt was portion of intestine itself.

4. The ready closing of the artificial anus, which was formed and healed in the space of five weeks.

Lisbon.

THE LONDON AND PROVINCIAL PRACTICE OF MEDICINE AND SURGERY.

REPORT ON MALIGNANT DISEASE OF THE TESTIS.

(Concluded from page 259.)

WE gave last week the particulars of thirty-six cases of malignant disease of the testis, in all, excepting one, of which excision of the diseased gland had been performed. We shall proceed to comment upon the cases, and to point out the conclusions which the series appears to warrant. Before doing this, however, it will be a convenience to the reader to arrange the cases in a tabular form.

TABULAR STATEMENT OF THIRTY-SIX CASES OF MALIGNANT DISEASE OF THE TESTIS.

No.	Hospital and Surgeon.	Age.	Duration of Disease.	State of Health.	Operation.	Proximate Result.	Ultior Result.	Other Facts.
1	King's College.—Mr. Partridge.	40	1 year ..	No indications of malignant cachexia.	Excised ..	Died of erysipelas on eighth day.	..	Autopsy revealed a large cancerous mass in lumbar glands.
2	.. Mr. Fergusson.	51	..	Cachectic ..	Excised ..	Recovered.	..	Very large malignant tumour found after death in abdomen.
3	.. Mr. Partridge.	43	3 years ..	No cachexia ..	Excision ..	Erysipelas; the patient died on the eleventh day.	..	
4	.. Mr. Fergusson.	38	2 years ..	Fair health ..	Excision ..	Recovered.	..	Three years ago Mr. Fergusson had removed a large fibrous tumour from scrotum, leaving the testis. The testis was lost in the general mass of disease.
5	.. Mr. Fergusson.	59	Excision of testis and scrotum.	Recovered	He returned to the Hospital for acute engorgement of the inguinal glands. At the end of six months he was in excellent health, but the glands were still suspiciously indurated.
6	St. Bartholomew's.—Mr. Lloyd.	34	7 months	Excision after exploratory operation.	Returned to his employment in a month.	In good health six months after the operation.	Left Hospital in delicate health after two months.
7	.. Mr. Stanley ..	38	Enlarged for 20 years, but more rapidly for 6 months	..	Testis and part of cord excised.	Convalescence tedious.	..	

No.	Hospital and Surgeon.	Age.	Duration of Disease.	State of Health.	Operation.	Proximate Result.	Ultimate Result.	Other Facts.
8	St. Bartholomew's.—Mr. Skey.	30	6 months ..	Good health ..	Excision	The excised gland for the most part consisted of medullary cancer, with some small cysts.
9	„ Mr. Skey ..	37	2 years	Healthy	Testis and lower third of the spermatic cord were excised.	Recovered.. ..	Readmitted shortly afterwards, and died of pleurisy.	In this instance the disease was undoubtedly malignant, as it recurred in glands and internal organs; its structure, however, was not medullary, but cartilaginous.
10	„ Mr. Lawrence	21	6 months ..	Good	Excision	Recovered.. ..	The disease returned in the cord before the man left the Hospital.	
11	Guy's.—Mr. Cock ..	26	1 year	Pale and cachectic.	Excision	Recovered..	The tumour was an example of mixed medullary and cystic disease.
12	„ Mr. Hilton ..	34	10 months ..	Fair health ..	Testis excised. The inguinal canal was opened and cord divided high up.	Recovered.	..	
13	„ Mr. Hilton ..	31	13 months ..	Good health ..	Excision	Recovered.	..	
14	„ Mr. Cock ..	37	..	No cachexia ..	Excision	Recovered.	..	
15	„ Mr. Hilton ..	56	1½ years ..	Good health ..	Excision	Recovered.	..	
16	„ Mr. Cock ..	28	4 or 5 months.	Good health ..	Excision	Death; six weeks.	..	Cancerous deposit was found after death in lumbar glands, right lung, and above clavicle.
17	Metropolitan Free.—Mr. Hutchinson.	2½	10 months	Excision	Recovered well	Died eleven months after operation.	He enjoyed good health for eight months after the operation, when symptoms of cancer of the lung showed themselves. Autopsy: both lungs infiltrated; with the exception of a small nodule the size of a pea, no disease was found in the abdomen. Two of his paternal aunts had died of cancer of the breast.
18	Marylebone Inf.—Mr. Thompson.	35	9 months	Excision	Recovered quickly.	..	An example of mixed cystic and medullary disease.
19	Westminster.—Mr. Brooke.	31	1 year	Testis diseased. Integument and lower part of the cord removed.	Recovered.	..	
20	Charing Cross.—Mr. Canton.	9	Referred to a kick some time before.	Healthy looking	Excision	Wound healed well, and he left the Hospital.	Disease returned in the cord and lumbar glands. Death three months after operation.	
21	St. Thomas's.—Dr. Barker.	26	3 months ..	Pale, sallow. Had rapidly lost health and strength.	Not removed ..	No operation had been performed	..	This patient died four months after he had first noticed the enlargement of the testis. No post-mortem was permitted. There was on admission (two months before his death) a large tumour in his abdomen, which grew rapidly.
22	„ Mr. Mackmurdo	50	..	Fair health ..	Excision	Recovered well.	..	
23	„ Mr. Solly ..	38	..	Good health ..	Excision	Recovered well.	..	
24	„ Mr. Simon ..	37	15 months ..	Sallow and cachectic.	Excision	
25	The London.—Mr. Luke.	4	..	Stout, but pale child.	Excision	Recovered.	..	
26	St. George's.—Mr. Cutler.	40(?)	Excision	Death on seventh day.	..	Autopsy showed evidences of peritonitis and of encysted disease of lumbar glands.
27	University College.—Mr. Quain.	16	8 months	Testis and cord as high as inguinal canal were removed.	Death a fortnight after the operation.	..	Autopsy revealed a large mass of medullary cancer in the right lumbar region.
28	Bristol Gen. Inf.—Mr. Lang.	Adult	5 months	Excision	Recovered..	At the time of the report one edge of the wound had assumed a suspicious appearance.
29	Dorset County Inf.—Mr. Sayle.	43	7 years enlarged, but increased rapidly lately.	Very healthy ..	Excision	Wound healed; man discharged well.	..	Notwithstanding the unusually long duration of the disease in this instance, it proved after excision to be medullary cancer. Probably in the first part of the time the enlargement had been of a simple nature.
30	Durham Infirmary.—Mr. Green.	21	18 months ..	Sallow and cachectic.	Excision	Recovered.	In three months the disease re-	
31	Bradford.—Mr. Popleton.	25	3 years	Excision	Wound healed rapidly.	..	
32	Leeds Infirmary.—Mr. Hey.	45	..	Healthy looking	Excision	Died of acute peritonitis three weeks after the operation.	..	
33	Sheffield Hospital.—Mr. Jackson.	25	6 months	Excision	Recovered well.	..	
34	Derby Infirmary.—Mr. Johnson.	26	Excision	Recovered.	..	
35	West Norfolk.—Mr. Kendall.	34	6 months	Excision	Recovered.	..	
36	„ Mr. Kendall ..	56	6 months ..	In failing health.	Excision	Died three months after the operation.	..	Erysipelas of the scrotum and groin and thigh followed the operation, and when recovering from this, three weeks after, a fungous bleeding growth appeared from the extremity of the cord. He died three months after the operation.

COMMENTS ON THE SERIES.

Forms of Cancer to which the Testis is liable.—Of the above thirty-six cases it would appear that in almost the whole the form of cancer was the soft form of medullary. In several the structure of the diseased mass was firmer than that of a typical medullary growth, but in none did it approach that of true scirrhus. Modern histological investigations have indeed tended to show that true scirrhus, such as that so commonly seen in the mammary gland, for instance, is never met with in the testis. The supposed instances of it described by Sir Astley Cooper, and other writers, have proved on microscopic examination to be not cancer but cartilage. It is quite possible also that examples of syphilitic sarcocele, with an unusual degree of induration, may occasionally have been regarded as scirrhus.

In Case 9 the original disease of the testis itself was simply cartilaginous, and the subsequent deposits in internal organs, which were very numerous, were of the same material. As to the malignancy of the disease in this case, there can, however, be no doubt, as the man died of its development in the lungs within a short period of the operation.

In Case 5 a "fibroid" tumour had been excised three months before from the scrotum, and the recurred one, which had involved the testis, if it did not originate in it, was of the same nature. This case probably stands on the border ground between true cancers and recurrent fibroids, and there is room for question as to the propriety of its being included in this series.

Cases 8, 11, and 18, are examples of the co-existence of medullary cancer, with well characterised cystic development.

Age most liable to malignant Disease of the Testis.—It would appear that all periods of life, excepting the senile, and including even those of infancy, are liable to the occurrence of malignant disease of the testicle. In the youngest patient in our list it began at the age of one year and eight months, whilst the oldest was 59. Taking the decennial periods, we have three instances of the disease occurring between the first and tenth years, one between 10 and 20, eight between 20 and 30, thirteen between 30 and 40, six between 40 and 50, and five between 50 and 60. The age stated in each case is that at which the patient came under Surgical treatment for his disease, and the age at which the latter had first commenced was most probably about a year younger. Bearing this fact in mind, we can have no hesitation in accepting the conclusion, that the first half of adult life (from 20 to 40) is the period in which the testis is most liable to be attacked by medullary cancer.

The instances in which the disease began in early boyhood have a peculiar interest. It is an important fact that the testis should be so liable as it is to the attacks of disease (benign as well as malignant) at periods considerably prior to its full development, and to the assumption of functional activity. Parallel instances of disease in the ovaries or mammary glands of preadolescent girls are undoubtedly far more rare. The converse comparison holds good as it regards the age at which the function of the gland in question has either ceased or is greatly on the wane. We have in the present series no example of cancer of the testis later than the age of fifty-nine, whilst but a very small proportion of the whole are met with so late as the fifth decade. In females, as is well known, diseases of the breasts and ovaries are still very frequent.

Usual Rate of Progress of Cancer of the Testis.—Malignant disease of the testis has a rapid progress. The facts recorded in the above series fully bear out these statements, and the inference is of great importance in its practical aspects.

In Case 21, the only one in which the disease ran its course without surgical interference, the patient was dead within four months of his having first noticed enlargement of the gland, at which time he was in what he considered robust health. The duration of the disease in Mr. Kidd's case (see foot-note to page 258), which was probably a similar one, was exactly the same.

In Cases 16, 36, 20, and 17, although an operation was performed, and in several of which it in all probability prolonged life, the whole duration from first to last was only six,

nine, twelve, and twenty-one months respectively. In Cases 1, 3, and 27, which ended fatally within a week or two of the operation, deposits of cancer were found in the lumbar glands, which must have induced death within short periods, even if the patients had recovered from the immediate effects of the operation. The average previous duration of the disease in these cases had been only eighteen months. In two or three instances in which durations of unusual length are assigned to the disease, it is not improbable that the testis during the earlier portions of the time, had not been affected by cancer, but by some inflammatory enlargement, on which at a subsequent period cancer had become engrafted. It is not at all unusual for cancer to attack organs damaged by previous chronic inflammations; and the fact that in the cases adverted to a recent rapid increase in size had been observed is in favour of our supposition.

Treatment.—Immediate Results of the Operation of Excision.—Although not a few and very different schemes of constitutional treatment have been proposed for the management of the more chronic cancers, none have, we believe, been suggested as likely to retard the progress of malignant disease of the testis. In this instance, the question as to treatment is simply, Shall extirpation be performed, or not? the alternative being certain and speedy death. As might be expected, therefore, under such circumstances, the propriety of extirpating a testis affected with malignant disease, provided the cord be healthy, is one of the rules in Surgery about which there is no dispute. The operation *per se* is one of little or no danger if done early, whilst the gland is not enlarged beyond a certain size, whilst the cord is healthy, and before the lumbar glands have been affected. In nearly all the cases in our series in which death followed as a consequence of the operation, large tumours were found in the abdomen, which had been unsuspected previously, but which had no doubt exercised a most prejudicial influence on the patient's chance of recovery. That excision of the testis in itself is not an operation attended by any material risk is proved by the facts that of the above series 26 out of 36 recovered from it, while of the cases to follow this report, in which the testis was removed for diseases of non-malignant nature, the proportion of recoveries was 26 to 1 death.

In determining which cases are best suited for operation, and those in which for the credit of Surgery it will be well to decline using the knife, regard should be had to the size and duration of the tumour, to the condition of the cord, to the patient's general health, and to the indications of disease of the lumbar glands. If there be good reason to think that the lumbar glands are already enlarged, or if the cord be positively enlarged at a point above where it could be divided, an operation could only end in disappointment. Too much weight in either direction must not be allowed to attach to the state of the patient's health. In not a few instances, owing to its rapid rate of progress, the disease has advanced beyond hope of benefit by Surgery, before the patient's aspect has assumed any very decided indications of malignant cachexia. In many of the cases in our list the statement is, that "the man was in good general health." On the other hand, it is quite possible that a patient might appear very cachectic from accidental causes, whilst still his lumbar glands were free from disease. The large size of the tumour, although "equalling that of a cocoa-nut," would not, of course, in itself deter any Surgeon from attempting its removal, other circumstances being favourable. It must be granted, however, that it renders the prognosis much more serious.

—The thirty-five cases ended in death within a week or two of the operation, and either as its immediate or indirect consequence. In five others (Cases 7, 28, 30, 10, 36), the patients did not while under observation regain their health, and in four of these the disease already appeared to be recurring, *i.e.*, within a month or two of the operation. In Cases 17, 20, and 30, although the patients regained good health after the operation, yet the disease recurred subsequently in internal organs, and death took place at the respective periods of three and ten months afterwards. In Case 16 the patient died within six weeks of the operation; not, however, from its effects, but from recurred and rapidly advancing disease. In Case 6 the patient was known to be in good health, but with suspicious induration of inguinal lymphatics, six months subsequent to his discharge from the Hospital.

These cases deducted, we have remaining twenty in which, beyond the fact that the patients left the Hospital well within short periods of the operation, we know nothing. Not a few of these men have, in all probability, since died of internal cancer; while there is a fair foundation for the belief that others are still in good health.

Mr. Cock has mentioned to us the case of a man whose testis he removed for medullary cancer, and who remained under observation and in good health for six years afterwards, being at length lost sight of in consequence of his emigration to Australia. This fact is the most important in relation to this subject that has come within our knowledge in the practice of the London Hospital. Whole histories of cases of malignant disease of the testis are much wanted in the literature of Clinical Surgery.

It is quite possible that some of our readers may be able to furnish us with the concluding histories of cases left incomplete in our series. If so, we shall, on behalf of Surgical science, feel much obliged by their supplying us with the wanting facts, which we shall have much pleasure in placing on record. In many instances the patients returned home into the country after leaving the Hospital.

MALIGNANT DISEASE OF THE CELLULAR TISSUE OF THE SCROTUM REQUIRING THE REMOVAL OF BOTH TESTES.

The Hull Infirmary: Mr. Craven.—A man, aged 45, admitted on account of great swelling of the scrotum, which had existed two months, but with rapid increase latterly. A puncture had been made in consequence of a deceptive sense of fluctuation in one part, but blood only flowed. Much pain in the back was complained of. The removal of the tumour, which included both testes, was at length decided on. It was found, on examination, to consist of a large growth of medullary cancer, in the cellular tissue of the scrotum, by which both the testes had been enveloped. The testes themselves were healthy. Under the microscope the usual appearances were seen. The man suffered much constitutional disturbance after the operation, but ultimately recovered. Some months after his return home (to Doncaster) he died of internal disease, probably of malignant character.

The above is included in the present series, because the operation involved the removal of both testes. It is an example of an exceedingly rare form of disease. Excisions of the entire scrotum for chimney-sweeps' cancer are not so very unusual, and every now and then it is necessary to remove the testes also; but in the above it will be seen that the deposit took place into the cellular tissue of the scrotum, and was of the medullary, not the epithelial, variety. The case has its analogues in respect to other organs. It is well known as regards malignant disease of the eye in children, that in not a few instances the malignant deposit takes place not into the eye itself, but into the cellular tissue surrounding it, and in certain instances of soft cancer of the breast it is probable, though less easy of demonstration, that the disease invades, in the first instance, the cellular tissue rather than the gland itself.

EXCISION OF THE TESTIS FOR ENCHONDROMA.

In Case 9 of the Malignant series, although the structure of the tumour was cartilage, its habitudes were those of acute cancer. The following is, consequently, the only example of benign enchondroma of the testis in our series. The specimen was a very well-characterised one, and was exhibited by Mr. Hutchinson, to whom it had been sent for examination, at one of the meetings of the Pathological Society:—

York County Hospital: Mr. Hey.—W. S., aged 55, was admitted on account of great enlargement of the right testicle. According to his account, three years ago the gland had wasted to the size of a hazel-nut. It remained very small for about a year, and then began to enlarge. It had been, throughout, the seat of slight darting pain. Its enlargement was rather rapid, and in the course of two years it had equalled the size of a large fist. It was very heavy and solid feeling, being also slightly nodular in parts. The cord was not thickened. Mr. Hey removed it in the usual manner, and the man recovered. It was a most excellent specimen of enchondromatous and cystic disease.

CASES OF CYSTIC SARCOMA OF THE TESTIS.

Four years ago we devoted a special report to "Cystic Sarcoma of the Testis." (See October 20, 1855, page 394.) We were then only able to collect from the London Hospitals five cases. In a tabular statement which accompanied our report we included all the examples of this disease which we were able to bring together, either from the Museum of the College of Surgeons, from Sir Astley Cooper's work, or other accessible sources. The whole number amounted only to sixteen. We now have to record four additional cases. In the latter number we have included only such examples of the disease as were pure, and unmixed with carcinoma. In the series of cases, of the latter disease, the reader will find several examples (Cases 8, 11, and 18) in which the cystic element co-existed with medullary cancer. In the report to which we have referred we entered into some details, under the heads of prognosis, diagnosis, pathology, etc., respecting various points of interest in connexion with this special form of disease, and it is therefore unnecessary that we should again do so on the present occasion. Our additional cases supply data which are closely in keeping with the conclusions then arrived at. They are interesting, however, as giving us an example of the disease occurring at the earliest age at which it has as yet been noticed. Of the sixteen cases given in our tabular report the average age was 44, the extremes being 18 and 58. In Case 3, given below, the age of the patient was only two years and nine months. The whole of the sixteen cases given in the table resulted in recovery, and the same was the fact with the four now added.

The small number of cases of this peculiar disease which we have been able to collect in so large a field of observation, as that supplied by the whole of the Metropolitan and more than half of our Provincial Hospitals, may afford a fair estimate of its comparative rarity.

As our present Report is intended to be statistical as regards the operation of excision of the testis, and to comprise all cases within a certain period in which it has been performed, we are obliged here to repeat briefly the particulars of two cases (Cases 1 and 2) which were given in our former one.

Case 1.—King's College Hospital: Mr. Fergusson.—A healthy-looking man, aged 32. The disease was consequent on a blow received eighteen months ago, since which time it had enlarged. It proved to be a good specimen of cystic disease. (Previously reported, p. 394, October 20, 1855.) The man recovered well after the excision.

Case 2.—St. Mary's Hospital: Mr. Coulson.—A healthy-looking man, aged 18, was admitted on account of considerable enlargement of the right testicle. The disease was believed to have existed only two months, and had only occasioned slight pain at intervals. The gland was about the size of a goose's egg, smooth, with a tight, elastic feel, but without fluctuation. The cord was not affected. The scrotum was red, and a little inflamed. After a fair trial of mercurial and iodine treatment, the removal of the gland was decided upon. After the operation, the patient had an attack of scarlet fever, from which, however, he recovered well. The wound soon healed. The disease proved to be cystic sarcoma, and involved the greater part of the gland. (Previously reported at page 394, October, 1855.)

Case 3.—Hospital for Sick Children: Mr. Athol Johnson.—A child, aged 2 years and 9 months, was admitted into the Hospital for Sick Children. Enlargement of one testis had been noticed almost from birth, and it had now increased till the gland measured about seven inches in circumference. It was removed, and found to be an example of cystic disease. The child recovered well. (For description of the specimen, see Report of the Pathological Society for February 5th.)

Case 4.—The Leicester Infirmary: Mr. Benfield.—A man, in good health, aged 43. The right testis had been enlarging for more than four years, and was now as large as two clenched fists. The whole was excised. In the operation the cord slipped, and the inguinal canal had to be laid open in order to secure the spermatic artery. The cord was healthy. The disease was cystic sarcoma. The wound healed well. A gland in the groin, which was at the time of the operation somewhat enlarged, increased subsequently, and a month afterwards was the size of a hen's egg. The man was still in excellent health.

Case 5.—The Leicester Infirmary: Mr. Macaulay.—A healthy man, aged 47. The enlargement of the testis had commenced about five years before, and on admission its size was that of a child's head. About four ounces of serum were drawn off from the tunica vaginalis on the day prior to the operation. The mass was excised in the usual way. The cord was tied *en masse* by a strong ligature. Before the man's removal from the operating-table this ligature slipped, and it became necessary to lay open the inguinal canal, in order to secure the bleeding vessels. Considerable oozing from the bottom of the wound continued for about five hours after the operation. The disease consisted of cystic sarcoma.

Case 6.—The Leeds Hospital: Mr. Smith.—A strumous man, aged 21, excision of the testis on account of well-characterized cystic sarcoma. Recovered well, and left the Hospital in much improved health.

CASES IN WHICH THE TESTIS WAS REMOVED FOR SCROFULOUS DISEASE, ABSCESS, ETC.

In the following group we have placed all the cases in which, during the last six years, the testis has been removed for other diseases than those included in the preceding Reports. ("Medullary Cancer," "Cystic Disease," etc.) The group therefore includes examples of syphilitic sarcoma, strumous disorganization of the gland, abscess, and one or two of certain rare forms of cyst within the tunica albuginea. We will arrange these cases under their several heads.

STRUMOUS AND SYPHILITIC DISEASE OF TESTIS.

In a great number of cases it is quite impossible to make a correct differential diagnosis between strumous and syphilitic disorganization of the gland, when the disease has advanced so far as to necessitate removal; we have, therefore, placed these two forms of chronic orchitis together in the subjoined list. Number of cases, 17; recovered, 16; died, 1:—

Case 1.—Guy's Hospital: Mr. Cooper Forster.—A man, aged 37, pale and emaciated, was admitted on account of diseased testis. The testis was as large as a fist, and no one who saw it expressed any doubt as to its being cancerous. Excision was performed, and on examination afterwards the whole gland was found to be disorganized by the infiltration of tubercle, the epididymis also being involved.

Case 2.—Guy's Hospital: Mr. Bryant.—H. M., a dark strumous child, aged 2½, was admitted into Guy's Hospital, October 13, 1858, under the care of Mr. Bryant. The disease had lasted for six months, and had increased rapidly in spite of all constitutional and local treatment. The organ was about eight or ten times its natural size, and was perforated by a sinus, which had been discharging for four months, and which communicated with a large abscess in the interior of the organ. It was removed October 26. On section a large mass of strumous deposit softening down, was seen to have been deposited in its centre, dilating the organ which appeared as a mere shell, some healthy structure being visible about the mass. In the epididymis were also three distinct masses of the same material.

Case 3.—The London Hospital: Mr. Luke.—A man, aged 21, the subject of strumous disease of the right testis, which had existed for nearly five years. The gland was excised, and the operation was followed by a low form of phlegmonous erysipelas, which extended gradually over the lower part of the abdomen, and into the thigh, and under which the patient gradually sunk. Death occurred eighteen days after the operation.

Case 4.—St. Bartholomew's Hospital: Mr. Lawrence.—A delicate man, aged 43, the subject, for seven months, of strumous disease of the testis. The gland was greatly enlarged, but no suppuration had occurred. After its extirpation, a severe attack of phlegmonous erysipelas occurred; but it was subdued, and a good recovery ensued.

Case 5.—St. Bartholomew's Hospital: Mr. Lawrence.—A mulatto, aged 29, the subject for thirteen months of strumous enlargement of the testis. No suppuration had occurred. Removal by the *écraseur* was attempted, but when nearly complete the instrument broke, and the knife had to be used to divide what remained. Two hours after removal hæmorrhage set in, and the only plan found efficient for controlling it was the pressure of the pad of a Signorini's tourniquet screwed down on to the crest of the pubes. Some sloughing of the edges of the wound, probably from the bruising inflicted

by the instrument, followed, but the patient ultimately recovered well.

Case 6.—St. Bartholomew's Hospital: Mr. Lloyd.—A man, aged 36; the whole testis and cord were converted into a hard mass, which, prior to the operation, all believed to be malignant. It proved, however, to be tuberculous only. The disease involved the cord higher than the external ring, and in the dissection the former was cut through a good half-inch above the latter. The man recovered well, and left the Hospital six weeks after the operation.

Case 7.—The Westminster Hospital: Mr. Hillman.—A man, aged 30; the testis was excised on account of scrofulous disease, which had destroyed its structure. Recovered.

Case 8.—St. Bartholomew's Hospital: Mr. Paget.—In this case Mr. Paget had performed the plastic operation recommended by Mr. Syme for the cure of fungous testis. The patient, a man, aged 31, remained well for about two months, and was engaged in a very laborious occupation. Ultimately, however, the cicatrix again ulcerated; and he applied for re-admission. It was now decided to remove what remained of the diseased gland. This was done; the patient has since done well, and the wound is now nearly healed. The gland was found, on examination to be so much disorganised that there could have been no object gained in attempting to preserve it.

Case 9.—Guy's Hospital: Mr. Cock.—A man, aged 57, who had been for some time under treatment on account of fungous protrusion of the right testis. Escharotics had been applied, and several times it had seemed about to heal, when fresh inflammation would occur. The patient at length desired the removal of the organ; and as it was plain that even, if preserved, it must be, as regards function, useless. Mr. Cock acceded to his wish. After removal, there was found very little of healthy gland tissue remaining, the greater part of the organ having been converted into a fibrous structure. The wound healed well.

Case 10.—Guy's Hospital: Mr. Hilton.—A man, aged 22, in good health, until within the last two years. For two years the left testis had been gradually increasing in size, and an abscess had formed, which had left a small sinus leading into the gland. Excision of the whole was performed. The gland was found infiltrated with tubercular deposit, which choked the tubes. The head of the epididymis was especially affected, and in some parts the structure of the gland itself remained sound.

Case 11.—University College Hospital: Mr. Erichsen.—A man, aged 40, under care on account of strumous disease of the testis of some years' duration. Excision of the gland. Recovery.

Case 12.—King's College Hospital: Mr. Fergusson.—A man, aged 33, the subject of strumous disease of the testis of six years' duration. It was the size of two fists. Excision. Recovery. In the specimen after removal the proper structure of the testis could not be discovered.

Case 13.—The Queen's Hospital, Birmingham: Mr. Langston Parker.—A labourer, aged 44, was admitted on account of enlargement of the left testicle, which he attributed to its having been squeezed in a "lark" eight months before. The skin was adherent and ulcerated; the increase in size had been gradual; the gland and the diseased skin were removed, and the former presented a specimen of chronic or strumous orchitis. The cord was tied *en masse* by a double ligature passed through it. Very little bleeding occurred at the time, but an hour afterwards it came on profusely. Ice, astringents, etc., were applied without avail, and finally the hæmorrhage was arrested by a large Signorini's tourniquet applied so as to compress the cord on the pubes. This was quite effectual. The man afterwards did well.

Case 14.—The West Norfolk Hospital: Mr. Kendall.—A man, aged 34, had suffered for several years from an enlargement of the right testis. It was the size of a goose's egg, not painful to the touch, but liable to severe shooting pains, which also affected the lumbar region. Treatment having failed to effect its diminution, it was excised. The man recovered well.

Case 15.—The York County Hospital: Mr. Hey.—A man, aged 37, was admitted on account of great enlargement of the right testis, which had been progressively increasing for nearly a year. It was the size of a goose's egg, and liable to aching, but not particularly tender. The scrotum was somewhat reddened, and adhered to the

gland. The cord was healthy. The man had had primary syphilis some time ago; but did not now present any very marked indications of constitutional taint. The testis was removed, and was found to have been destroyed by a large collection of soft curdy matter in its structure, the centre of which was almost purulent. In the structure surrounding this collection were two or three cysts of moderate size. The man recovered well; but about a month after dismissal he was re-admitted, on account of acute orchitis of the remaining gland, which, however, subsided under the usual treatment, though leaving some induration.

Case 16.—The Liverpool Royal Infirmary: Mr. Long.—A man, aged 26, the subject of strumous disease of the testis following a blow. Excision of the gland. Recovery.

Case 17.—The Liverpool Royal Infirmary: Mr. Stubbs.—The gland was excised on account of strumous disorganisation, and the man recovered. (No details.)

EXCISION OF THE TESTIS FOR CIRCUMSCRIBED ABSCESS.

A soldier, aged 24, was admitted into one of the London Hospitals, in consequence of diseased testis. The affected gland was as large as a goose's egg, and the scrotum was reddened and adherent. Two small fistulæ led deeply into the organ from which small quantities of thin pus escaped. The disease was attributed to a blow received eighteen months before. The entire gland was excised, and the man recovered well. On examination there was found in the middle of the testis, a circumscribed abscess about the size of a hen's egg, distended by thick pus, and lined with a villous membrane. Around the cavity the structure of the gland was spread out, appearing to be in most parts quite healthy.

EXCISION OF THE TESTIS FOR THICK-WALLED CYST WITHIN THE TUNICA ALBUGINEA.

The Metropolitan Free Hospital: Mr. Hutchinson.—A man, aged 65. The left testis was enlarged to the size of a small fist, but was quite moveable in the scrotum. The history was of an increase for six years. It was removed chiefly on account of its weight and inconvenience. The disease proved to be a thick-walled cyst in the tunica albuginea. (See Report of the Pathological Society.) The man recovered well. In the operation Mr. Hutchinson employed for holding the cord an ingenious little instrument, devised by Mr. Callaway, of Guy's, for that purpose. The incision instead of being made, as usual in front of the scrotum, was made at the bottom, a depending opening for the escape of matter being thereby secured.

EXCISION OF THE TESTIS FOR ENCYSTED HÆMATOCELE OF THE EPIDIDYMIS.

The London Hospital: Mr. Curling.—J. B., aged 49, was admitted in 1853. Thirteen years ago he received a sharp blow over the left testicle. The acute symptoms soon subsided, but the enlargement continued, and had increased during the last ten years. During the last week the swelling had increased more rapidly and had been attended with pain. The left side of scrotum contained a fluctuating tumour of large size, with a solid-feeling mass (testis) at the bottom. Cord, thick and firm. On dissection after removal, there was found a thick-walled cavity in the head of the epididymis, not communicating with the tunica vaginalis in any way.

RADCLIFFE TRAVELLING FELLOWSHIP.—In conformity with an ordinance of the University Commissioners, the electors under the will of Dr. Radcliffe have directed that an examination for a Travelling Fellowship shall be held in the course of next term. The Examiners will hereafter notify the particulars of the examination, which will be in sciences connected with Medicine. The successful candidates will receive £200 per year for three years, half that time being occupied in Medical study out of Great Britain. One such Fellowship will henceforward be offered for competition every year. Those may be admitted as candidates who have taken a first class in the Natural Science School of Oxford, and who intend to qualify themselves to practise Medicine as Medical Graduates of the University.

Medical Times & Gazette.

SATURDAY, SEPTEMBER 17.

POOR-LAW MISDEEDS AT THE CORK WORKHOUSE.

THE unfortunate persons whose poverty, disease, helplessness, or old age, drives them within the walls of a British workhouse are too often subjected to an amount of tyranny, cruelty, and neglect little understood by the general public, who imagine that the funds raised by the poor-rates are equitably administered in the relief of suffering humanity. The injustice inflicted upon these helpless inmates of our modern Bastilles is scarcely ever revealed to the public gaze. The so-called guardians (Heaven save the mark!) regard the poor as so many burdens upon the rate-payers; and whether the pauper has been reduced to his miserable condition by the ravages of disease, by the vice or neglect of parents, by the feebleness of age, by the pressure of unavoidable misfortune, or by his own misconduct, he is placed in the same category, and exposed to the same merciless and indiscriminating régime. Now and then, it is true, some patriotic person, perhaps a Medical officer of the establishment, not having before his eyes the fear of dismissal from his situation, raises his voice against the iniquity which he sees perpetrated, and drags into the light of day a story of oppression and neglect, which for a while jars upon the popular ear, awakens a cry of commiseration, then forthwith dies away into silence. The solemn farce of an appeal to the Poor-Law Commissioners is occasionally enacted, and the facts represented are proved to be literally true, but the conscientious witness is dismissed, and the abuses go on as before.

These remarks have been called forth by the report of some recent proceedings at the Cork Workhouse, which, as it would appear, is urgently in need of some sweeping measure of reform. In this instance, the Medical officers of the institution have not endangered their places by any unseemly revelations of the misconduct of their employers, and the duty of exposure has devolved upon a gentleman who is quite able to substantiate his case, and who, from his influential position, is in no fear of any consequences disastrous to himself. This social reformer is Mr. John Arnott, Member of Parliament for Kinsale, and Mayor of Cork; and we think that public gratitude is due to this energetic man who has had the boldness to reveal the misdeeds of the Cork Guardians, and who possesses sufficient energy to maintain his opinions against the odium which his interested opponents have not failed to lavish upon him.

It appears that on visiting the Cork Union Workhouse, Mr. Arnott was shocked at the appearance of the children, of whom a large number are maintained in the building. Upon investigation, he discovered that an enormous proportion were afflicted with scrofulous diseases, many of them dying prematurely, others becoming blind, and those who

survived dragging on a miserable and feeble existence, to which death itself would almost appear preferable. We must quote Mr. Arnott's own words in describing this appalling spectacle:—

"For want of proper nutriment and change of diet, scrofula has so infected these young creatures, that there was scarcely one of them whom I examined that did not bear plain and frightful tokens that their blood had been wasted to that degree, that the current which should have borne vigour and health to their frames, was only a medium to disseminate debility and disease. Not to speak of some fifty children sent from this institution to the Blind Asylum, for ever lost to the first blessing which God poured upon creation, from the disease engendered by the diet here; not to dwell upon the cruel spectacle of the Infirmary, where, in every phase, this shocking infliction may be seen in its most revolting forms, I will only point attention to the children who are still able to attend school. As I have said, *there is scarcely one of these not diseased*; but besides 115 that can move about, and are not perfectly ruined, there are in an upper school-room 48 young creatures so stunted in growth and intellect, and awfully affected, that no humane man could look upon them without the deepest compassion. In the female school the same general remarks apply; but there are 92 girls still presentable, and 84 in the infant class; but there is another lazar department of 64, as fearful objects as those I have just described. There is no separate register of the deaths of children kept in the house; but I have been told, and can well believe it from what I have witnessed and detailed, *that four out of every five die before they are adults*, and that the survivor is, in the majority of instances, destroyed in constitution."

The causes of this fearful amount of sickness and mortality may be readily explained by reference to the dietary of these poor children, and on this subject we may quote the evidence of Dr. Callanan, who inspected the Workhouse, and who was examined on oath before the Poor-Law Inspector:—

"On the day I arrived," says Dr. Callanan, "it was the hour the boys were at their dinner. I examined the food, and after their meal I inspected it. I asked for a bowl of the soup. I examined and tasted it, and I found it almost perfect water. I asked of what it consisted, and I was told of rice, and oatmeal, and vegetables. Some green leaves of leek were in the soup. I went along the form while they were at the meal, and I found some of the porringers untouched. I asked them why they did not take their soup, and they said, They could not drink it. I saw the bread, and I thought it very inferior: it smelled sour, and was heavy and gluey; it appeared to be composed of very coarse flour, and of an inferior quality."

On this evidence Mr. Arnott makes the bitter remark, that in Dickens's "Oliver Twist," the Workhouse-boy astonishes his superiors by asking for more; but in the case of the Cork Workhouse-boys, they prefer starvation itself to eating the food placed before them.

Humanity shudders at this revelation of the amount of sickness and mortality in an institution founded for the relief of the poor and destitute, and science is at no loss to explain the results upon ordinary physiological principles. Here are growing children fed upon soup consisting of water, rice, oatmeal, and vegetables, including a few green leaves of leek, and this diet is varied with sour bread, made of inferior flour, and occasionally with skim milk. To Medical readers it is needless to remark that such a diet as is here described is insufficient to nourish the human tissues, and that in the absence of nourishment, disease, especially scrofula, with its concomitant sufferings and death, must ensue. The Medical officers of the Cork Workhouse appear to be fully aware of this truth, and one of them has avowed his convictions in his evidence before the Poor-Law Inspector.

Dr. W. C. Townsend, one of the Medical officers, states:—"Such a dietary, in my opinion, would not keep the children in vigorous health. On the contrary, it would reduce their bodies into such a state that they would easily become victims to disease, and if an hereditary taint existed in the system, it would be readily called into action. . . . I think

the diet deficient in many things; I think the children ought to be provided with new milk; I think they ought to get white bread and meat twice or three times a week; and I am opposed to giving them soup—even meat-soup—without the meat in which it is boiled."

Dr. Townsend, however, goes on to state that he did not report his opinion to the guardians, because he was an officer of short standing: that he did not communicate his views to his colleagues nor to the House Committee: that except in cases of actual sickness the Medical officers had little or nothing to do with the dietary of the house: and he thought that if he reported the matter to the Board, "*he would very likely have been snubbed.*" "I recollect," he says, "on one occasion being sent for to the Board-room, when tenders were about to be accepted; and although I was sent for to give my opinion, a guardian ordered me to be turned out."

Such is the system of dietary adopted for the poor children in the Cork Union Workhouse; such is the respect paid to the opinions of the Medical officers; and such are the fatal results of the inhumanity of the proceedings. We turn from the Cork Workhouse—the inmates of which are brought there by misfortune and disease—to the Spike Island Government Prison, where, we are told, the prisoners have beef, beef-soup, and vegetables, four times a week; and that the results of this diet are manifest in the improved health of the prisoners, and in the extraordinary reduction in the number of deaths among them. Commentary upon these facts is needless. It would seem as if our rulers rewarded crime, and reserved punishment for the victims of misery and disease.

Mr. Arnott writes:—"Our prisons and reformatories are leaving our workhouses far behind. There is a sore temptation presented to the poor by the contrast which these institutions bear to our workhouses, to *qualify themselves* for places where they are better fed and better taught. As matters now stand, there is a premium on crime, not that our criminals are treated too well, but our poor not well enough, or well at all."

THE WEEK.

As all the world is interested in the *Great Eastern* steamship, we insert the following lines from a Medical friend who was on board at the time of the explosion which took place on Friday last:—

"The power and good qualities of the vessel have been proved beyond all kind of doubt. She has done, as a conveyance on the ocean, more than has ever been anticipated from her. With a very strong gale dead a-head, and steaming at half power, she accomplished the journey from the Nore to Portland in about twenty-four hours. While the Folkestone and Dover boats were jumping about like cockle-shells, the motion of the *Great Eastern* was actually imperceptible to those on board of her. She answered her helm with surprising readiness; and, in a word, five minutes before the catastrophe—which has thrown such a cloud over the vessel—occurred, every soul on board thought and felt that she was the model of steam-ships, and that the way to cure seasickness was at length discovered. Calmly and deliberately, I do not hesitate in affirming that the accident which has occurred ought in no degree to alter the opinion of the excellence of the vessel, as thus demonstrated by her course in St. George's Channel. The accident was one of the purest negligence, and will have to be accounted for elsewhere. I would add, that from personal observation, I gladly bear witness to the fact, that every thing which could be done, after the accident, in the way of rescuing the wounded, and securing the ship, was done, and done at once, by Captain Harrison and his officers and crew. Before the steam and stench had cleared away, the gallant Captain was already lowered down into the saloon, seeking for wounded passengers. Again, directly that it was possible for any one to descend into the stoke-holes, bold fellows were there as volunteers to rescue the wretched firemen, and bring them up out of the sulphurous vapours in which they were immersed. The scene was indeed a fearful one, but it was bravely encountered;

and it is only bare justice to Captain Harrison and his admirable officers, that this fact should be everywhere known. The success of the ship will be delayed; but this accident will not prevent its ultimate triumph;—of that I feel most fully satisfied."

Another painful inquiry has taken place near Durham, consequent upon the death of a poor woman from rupture of the uterus in labour. The account we have received does not lead us to any further conclusion than that the labour was a lingering one, and the pelvis rather small; that no instruments were used, that the rupture of the uterus was spontaneous, and that the woman died undelivered. It seems, however, that there was some charge of malpraxis made, not by one Medical man against another, but by the assistant of one against the assistant of another, and the respective employers afterwards followed suit. The verdict of the Coroner's jury was that the woman died of "rupture of the uterus, and hæmorrhage," exonerating the attending assistant from blame. The *Durham County Advertiser* thus concludes a long report of the inquest:—

"During the progress of the inquest it appears that a large number of persons had assembled in front of the house, and as soon as the verdict was known, and Messrs. Jepson, Russell, and Ridley came out, they were hissed and hooted by the crowd. Messrs. Shaw, Galt, and Laidler were, on the contrary, received with cheers, and the crowd surrounded the house where they dined, and loudly expressed their satisfaction at the verdict. It appears that Mr. Jepson is the Surgeon appointed to the colliery, by the owners, and has Mr. Ridley as his resident assistant. Mr. Shaw visits Thornley as a private Practitioner, and has Mr. Galt as his resident assistant—this may, perhaps, in some degree account for the popular feeling on the occasion. Mr. Galt has not yet passed his examination, and is consequently not a qualified Medical Practitioner,—although he has attended lectures with a view to passing. Mr. Laidler holds a midwifery diploma from Glasgow University, but is otherwise, we believe, not duly qualified. Mr. Ridley, on the other hand, is we understand a duly-qualified Practitioner. As a close to the proceedings of the day, Messrs. Brignal, Jepson, and Russell, were hooted out of the village, while Messrs. J. Marshall and Shaw made a triumphant exit. One of the jurors remarked during the progress of the case that it was a 'Doctor's squabble,'—we think he was about right."

We should not give this further publicity to so distressing a scene, did we not hope that a lesson might be inculcated,—that every means which good-feeling teaches might be taken to prevent the repetition of any such discreditable exhibition of Professional bickering, and that all may see how much the whole Profession must suffer in public estimation from the petty jealousies of some few of its members being paraded on every possible opportunity.

Another charge of poisoning bids fair to rival in medico-legal interest the Smethurst Case. The prisoner has been committed to take his trial for murder. In the present state of the case, however, it is only necessary to state that a young woman died soon after getting over her confinement, and with symptoms of irritant poisoning. Dr. Letheby could find no metallic poison in the body, except a little mercury, traceable to some calomel administered; but he found in an alcoholic solution of the stomach, and of a portion of its contents, and of some vomited matter, "a small quantity of oily-looking matter, which I found by experiments was a very powerful irritant; for, on applying it to the corner of my mouth, it produced intense burning pain and great swelling of the lips, followed by the appearance of small vesicles." Finding after exhumation of the body some of the same kind of acrid matter in the intestines, Dr. Letheby says:—

"Not being able to identify the nature of it chemically, I tried the effect of it on a guinea-pig. The coloured matter

amounted to four grains only. It killed the animal in ten minutes, as I thought by producing spasms at the entrance of the windpipe. I then removed the stomach and œsophagus from the guinea-pig, and again extracted the poison, and tried its effects on three sparrows. The first was killed in four minutes, the second between four and five minutes, and the third, which I treated a little differently, died in three days; I treated it differently as an experiment. I dropped the poison into the mouths of the first and second birds, and added a little treacle and water in the poison I gave the third bird. The total quantity extracted from the stomach and intestines amounted to about four drops. I have made a great many experiments with vegetable matter, in order to endeavour to arrive at the nature of this matter, but have not succeeded. I have no doubt it is capable of producing the effects mentioned in this case. Having seen three birds killed by it, and a guinea-pig also killed, and feeling myself the effects of it, I have no doubt but that it is a poison, and that it would produce the symptoms and the effects in the stomach that have been described by Mr. Webb and Mr. Smith. It is like croton-oil, or white hellebore. It is different from cantharides. A mixture of the two, I mean croton-oil and white hellebore, would exactly produce the effect I have described. Uphorbium has also a somewhat similar effect. From the symptoms before death, the appearances and the results of the chemical analysis, and the experiment made on myself and on birds and animals, I am of opinion there was present a powerful irritant taken by the deceased, and it was the cause of her death. That powerful irritant must have been taken by the deceased, and could not have been spontaneously generated in the system."

There is ample room here for another great battle of scientific witnesses in the criminal court.

We trust that some member of our Profession will not fail faithfully to observe and record the different phases of the curious Religious hysteria which is now raging in the North of Ireland, and which is threatening to invade some districts of England. Enough has been shown to prove that the "Religious Revivals" are an actual and real mental malady, and no imposture at all.

Our readers will doubtless recollect our account of Mr. Frank Buckland's discovery of the remains of John Hunter, and we feel certain they will now hear with great pleasure that the Leeds School of Medicine have presented him with a medal in commemoration of this circumstance. At a meeting of the Council of this School, held a few days ago, Mr. Samuel Smith moved the following resolution which was carried unanimously:—

"That a silver medal be presented to Francis T. Buckland, Esq., as a mark of respect from the Council of the Leeds School of Medicine, for his exertions in placing the remains of the late John Hunter in Westminster Abbey."

This graceful act is as creditable to the Leeds School as it must be gratifying to Mr. Buckland.

The question as to the right of Dentists to call themselves Surgeon-Dentists if they are not members of a College of Surgeons, has been rather warmly discussed by the respective Secretaries of the College of Dentists and the Medical Registration Association. The former gentleman throws down the gauntlet thus, gallantly suggesting "that the question be fairly tried in a London Police Court, when, if there should still appear good grounds for doubts as to the real spirit and intention of the last clause of the Medical Act, the matter could be finally settled in the Court of Queen's Bench. As the President of the College is also a Member of the College of Surgeons of England, it is thought by the Council to be desirable that your Committee should prosecute some member of the Council (not of those also members of the

College of Surgeons) resident in London or in the immediate neighbourhood, and they would be prepared to defend his case. I may mention that I practise, as I have done for many years, as a 'Surgeon-Dentist;' and for the sake of settling the question, I am willing to be proceeded against." The other disputant replies that the Association will legally contest the point "at a convenient time." In the meantime he argues that the title Surgeon-Dentist is used to draw other business than pure dentistry, adding,—

"The Committee regard it as extremely unfair that dentists should assume a title which has not been obtained by any surgical education or examination. The object of those, however, who assume that title improperly is apparent—viz., to have an honourable distinction with its concomitant advantages, and to enjoy privileges which they have not legally acquired. To sum up the views of the Committee, they are as follows—viz., 1st. The word 'dentist' means 'an operator on the teeth.' 2nd. 'Surgeon-dentist' implies that, in addition to the occupation of 'dentist,' the party has the statutory qualification of 'Surgeon.' 3rd. It is penal to use the prefix 'Surgeon,' unless in possession of the legal qualification conferring such title."

In founding the Medical Registration Association for Birmingham and the Midland Counties, which we have mentioned in a former number, the question was discussed whether Homœopaths should be admitted as members. A rule was proposed that "orthodox," members of the Profession should be eligible as members. This drew forth the following letter from four Homœopaths:—

"Birmingham Homœopathic Hospital, 2, Upper Priory,
September 1, 1859.

"Dear Sir,—An advertisement having appeared in the public papers of the proceedings connected with the formation of a Medical Registration Society, we have observed that one resolution states that only *orthodox* Medical men are eligible for membership. The fact of our not having received any invitation to take part in the formation of the Association, while other Medical men in the district have received such invitation, and the circumstance that an impression prevails among the public that the term 'orthodox' has been purposely made use of in order to exclude homœopathic practitioners, induces us to request of you, as Chairman of the meeting, an explanation of the matter. Being legally qualified and duly registered Medical men, does our approval of the homœopathic system of medicine, and our open practice of it, disqualify us from becoming members of the proposed Medical Association, founded as that Association, is professedly for public objects, and based as it is on an Act of Parliament, which expressly discourages disqualification on the ground of difference of Medical creed and practice?"

"We are, dear Sir, yours faithfully,

"GEORGE FEARON,

"JOSEPH LAWRENCE,

"W. A. PARSONS,

"HENRY ROBERTSON,

"Medical Officers of the Birmingham Homœopathic Hospital and Dispensary.

"To Dr. Bell Fletcher."

A sharp discussion ensued; some gentlemen moving that "legally qualified" be substituted for "orthodox," others waxing eloquent upon the stale and exploded clap-trap of persecution,—Harvey, Jenner, Galileo, and so on; and a third party endowed with more common sense, asking why the Homœopaths did not form an Association among themselves. Why should they aspire to join a body of men they constantly stigmatise as poisoners and murderers? On a division only two hands were held up for the globulists, and the restriction of the membership to the "orthodox" carried by the rest of the meeting.

Dr. J. E. T. Parratt, Deputy Inspector-General of Hospitals, and principal Medical Officer at Woolwich, examined

on the 9th inst. the man who was flogged there on the 1st; and he writes as follows:—

I beg to state that yesterday morning I examined the man, and found the remains of a small boil, the size of a shilling, over the upper part of the bladebone, where the mark of the lash appears not to have reached, and two or three small pimples, the size of small peas, where the punishment was inflicted, the laceration from which was so superficial as evidently not to have penetrated deeper than the skin, and consequently had nearly healed.

We have already alluded to the brutal and brutalising punishment called *flogging* in the Army; and we sincerely hope that this question, which has been principally brought into consideration before the public at the present moment by the history of the case above alluded to, will not be suffered to vanish away on a side wind. It affects the main point in no manner of way, whether this particular man's back was or was not covered with boils at the time of his being flogged. The very spirit in which some "authority," who was present at the flogging, addresses the *Times* on the subject, proves the demoralising influence which acquaintance with such torturing has upon the minds of those who superintend and direct it. "Not fourteen," he says, "only about ten were carried fainting at the sight out of the ranks!" This subject should not be suffered to rest until the abomination is purged from the Army. We may be sure that the Horse-Guards will never cure itself of the disease."

PROGRESS OF MEDICAL SCIENCE.

Selections from Foreign Journals.

ON ELIMINATION OF LEAD FROM THE SYSTEM.

By Dr. BACON.

"For some years past I have had occasion to make many analyses of the urine in cases of chronic lead-poisoning. Some points which have attracted my attention may have a practical interest. It is not known in what state of combination absorbed lead is locked up in the tissues. An organic compound of albumen with oxide or chloride of lead may be formed; or a double chloride of lead with chloride of potassium or sodium, as was long since maintained by Mialhe. Various compounds of lead taken into the stomach, except perhaps the sulphide, are decomposed and dissolved by the alkaline chlorides normally present in the alimentary canal; and a recent analysis by Professor Würtz shows that a leaden bullet, which had been for many years embedded in a cyst in the lung, was corroded, much diminished in weight, and surrounded by a crust of chloride free from sulphate or phosphate. In that case lead was found in the substance of the lungs and the diaphragm. Absorbed lead is diffused generally through the system, but not uniformly. The spleen contains the largest proportion, and next to that, the liver. Lead also occurs in the urine, which seems to be the chief channel of elimination. When once deposited in the tissues, it is very slowly removed, and the symptoms continue for many months after exposure to the cause of lead-poisoning has ceased. Still there is no doubt that in time it will be eliminated spontaneously. In cases where I have analysed the urine previous to treatment, but after removal from the source of poison, lead has rarely been present.

"Of late years iodide of potassium has been much used as a means of eliminating absorbed lead, and most of my analyses have been made in cases under this treatment. Melsens maintains that large amounts of lead were removed in form of iodide of lead, easily soluble in iodide of potassium, which is well known to pass off readily by the urine. In the cases that have come under my notice, repeated analyses, made at various periods after the use of the iodide was commenced, and under large or small doses, have never detected more than a very small proportion of lead. Usually, it is more easily discovered after than before taking the iodide; but sometimes none at all can be detected, when the symptoms are even well-marked. As the processes employed allow of

the detection of exceedingly minute quantities of the metal, the conclusion cannot be avoided that, in cases of chronic lead-poisoning the process of elimination is very slow, and a long time must be required to remove any considerable deposit from the tissues. . . . It is evident that iodide of potassium, the most energetic agent known for removing absorbed lead from the system, is far less efficient in this respect than is generally believed."—*Boston Journal*, June, p. 429.

ON THE CAUSE OF LONG AND SHORT SIGHTS, AND ON THE VOLUNTARY CONTRACTION AND DILATATION OF THE PUPIL.

By Dr. CHARLES WRIGHT.

Dr. Wright presents the following new theory of long and short-sightedness, as the result of a long series of experiments and observations. Rejecting the explanation of the phenomena by a change in the refractory power of the transparent media, he considers that "the essential cause of short-sightedness is to be sought for in the iris, which in all cases is preternaturally contracted, or possesses an unusual degree of irritability. When the case is congenital, the iris possesses an excessive degree of sensibility to impressions of light; in fact, this form of the affection is almost always observed in individuals of a nervous temperament, together with an excessive degree of muscular irritability. Exposure to a bright light aggravates the congenital form by producing contraction of the circular fibres of the iris, and the same remark will apply to large doses of opium, which not only aggravate the affection in the myopic individual, but will produce temporary near-sightedness in a person not so afflicted. In congenital cases any means that will produce dilatation of the pupil, as belladonna, will enable the person to read with the book held at the same distance as a person would require it to be whose eyes are sound. I have repeatedly experimented with opium and belladonna, and always with the same opposite results—shortening the field of vision with opium, extending it with belladonna.

"The true cause of long-sightedness consists in a preternatural dilatation of the pupil, or, what amounts to the same thing, a loss of irritability of the circular fibres of the iris. This, as is well-known, is a condition common to persons advanced in life, or those who are in the habit of viewing objects in the distance. Contrary to the statement of most writers on the subject, the sight of the myopic improves as he advances in life, nor have I ever known such a person to become long-sighted. In senile presbyopia the iris does not respond so readily to the rays of light as it does before that condition obtains. . . . From the foregoing observations it would appear that the iris is the principal means by which the eye is enabled to adapt itself to viewing objects distinctly which are situated at different distances from the observer. As to the power which the ciliary muscle is supposed to possess in adjusting the focal distance of the eye, nothing definite is known. At most, its action is subsidiary, inasmuch as such an arrangement is not at all necessary to the successful operation of the optical mechanism of the eye.

"As regards the power which man has over the muscular fibres of the iris, there can be no doubt but that by a little practice the pupil can be made to dilate and contract with as much facility, by an effort of the will, as that the number of respiratory movements can be increased or diminished at pleasure. This power over the iris can be acquired by rapidly changing the focal distance of the eye, which can be accomplished by interposing a small object between the eye, and a larger one situated a mile or more from the observer. A common pin, held at a distance of four or five inches from the eye, and on a line with the distant object, is well adapted to the experiment. On viewing alternately the far and the near object, the iris will be observed to dilate when the eye is fixed on the former, and to contract on the latter. On making this experiment a few times the observer will be enabled to contract or dilate the pupil at will. At first, by fixing the eye upon imaginary objects, and, in a short time, without any assistance of the kind. The experiment is best conducted in a room where the sun's rays have not a direct entrance; but in other respects the light may be as intense as that which is most agreeable in reading. In a strong light voluntary control over the iris greatly diminishes."—*North American Medico-Chirurgical Review*, July, p. 705.

EXCERPTA MINORA.

Transposition of Viscera.—On examination of the body of a patient who had died of phthisis, Dr. A. Smith found a complete transposition of the viscera of the thoracic and abdominal viscera from the innominata to the rectum. The left lung had three, and the right two, lobes. The heart lay with its apex directed to the right side. The mitral valve and the aorta were on the right, the arch of the latter curving out upon the same side, and sending out the innominata on the left side of the arch. The venæ cavæ were both on the left side. In the abdomen on the right side were found the spleen, stomach, descending colon, sigmoid flexure, and rectum; on the left were the liver, ascending colon, and cæcum. The larger lobe of the liver was upon the left side, though there was much less disparity between the two lobes than usual.—*North American Medico-Chirurgical Review*, July, p. 682.

Case of Cesarean Section.—Dr. M'Clelland relates a case in which this operation was resorted to in great contraction of the pelvis, with the effect of saving both mother and child.—*Ibid.*, July, p. 707.

Case of Spontaneous Evolution.—Dr. Richardson relates the case of a woman in whom labour was brought on several weeks before the full time in consequence of a blow. She had suffered greatly for three days when she was brought to the Blockley Hospital, and it was found that an elbow was presenting; owing to the rigid contraction of the os uteri about the arm, no attempt at rectification was made. About two hours subsequently, the os and the vagina had become relaxed, and an arm protruded. Turning was now attempted; but owing to the extreme sensitiveness of the uterus, had to be desisted from. The pains continued violent, and on a subsequent examination, the arm was found to have become withdrawn as far as the fingers. In an hour and a-half a dead fetus, weighing five pounds and a-half, was born, the head coming first, and constituting a case of spontaneous evolution. The whole time occupied from the first examination was about five hours.—*American Journal of Medical Science*, July, p. 279.

Amputation at the Hip-joint in the United States.—The *Chicago Medical Journal* in announcing the performance of this operation by Dr. Brainard, quotes from Dr. Eve the statistics as regards the States. It has been done six times, and four of these with success. In another case the patient recovered, but died of a recurrence of the disease; and in one case the result is not stated. Dr. Brainard's case, which makes the seventh, was unsuccessful. Dr. Warren performed the operation upon a lad 17 years of age, who will in all probability recover.—*Boston Journal*, April, p. 227.

Injection of Iodine in Chronic Hydrocephalus.—Dr. Brainard, of Chicago, relates two cases in which he has performed this. In one the child was two months old, and the head measured twenty inches in circumference. At the first puncture eleven ounces, and on the second twenty-four ounces, of serum were withdrawn. Three drachms of tincture of iodine diluted with twenty-four of water were then injected, one-eighth part being allowed to flow out. It was calculated that about sixteen grains of iodine and 3iij. of alcohol were inserted. Twenty days after the operation the head was the natural size, and so remained on the thirty-fifth day. The second case was four days old, and had also spina bifida. The head measured nineteen inches in circumference. The spina bifida was cured by an injection of gr. $\frac{1}{8}$ of iodine, and gr. $\frac{1}{2}$ of iod. potass in aq. dist. $\mathfrak{z}\frac{1}{2}$. There were made twenty-one injections of iodine into the ventricles during eight months, when the child died. The amount of iodine injected each time varied from gr. $\frac{1}{8}$ to gr. xij., with from two to three times the quantity of iod. potass., and the excretions frequently gave evidence of the presence of iodide. The case was a very unfavorable one, but the life of the patient was probably prolonged by the treatment.—*Boston Journal*, May, p. 344.

THE funeral of Surgeon Simpson, of Haslar Hospital, who died at that establishment on the 28th ult. of brain fever, took place on Thursday week with military honours in the grounds attached to the Hospital. Dr. Simpson served five years in the Arctic expedition in search of Sir John Franklin in the *Plow*, commanded by Lieutenant R. Maguire, now commanding Her Majesty's ship *Imperieuse*.

GENERAL CORRESPONDENCE.

RESULTS OF EXCISION OF MALIGNANT DISEASE OF TESTIS.

LETTER FROM MR. JACKSON.

[To the Editor of the Medical Times and Gazette.]

SIR,—In your report of operations on the testis in the *Medical Times and Gazette* of to-day, a case of mine in the Sheffield General Infirmary is reported as a successful one. As statistics, to be useful, must be correct, I send you the following account, by which you will see that this is another instance of recurrence of the disease terminating fatally.

The testis was extirpated on the 27th of May, 1857; and on the 23rd of July, the wound having healed, the patient was made an out-patient. There was at the upper part of the cicatrix a suspicious-looking fulness, but otherwise he was quite well. On the 2nd of September he was re-admitted, the suspicious fulness having rapidly developed itself into a tumour of large size. He sank on the 3rd of November.

I am, &c.

HENRY JACKSON,

Senior Surgeon to the Sheffield General Infirmary.
St. James's-row, Sheffield,
Sept. 10.

DR. BARKER AND MR. CHAVASSE.

LETTER FROM DR. BARKER.

[To the Editor of the Medical Times and Gazette.]

SIR,—A letter by Mr. P. H. Chavasse in your number of to-day claims a few lines from myself. A foot-note, containing certain pap formulæ, and which had been transferred from a little work on the Diet of Infancy and Childhood, published ten years ago, constitutes a ground of complaint. Now, for the first time, I find that four out of the nine pap formulæ I have given in the said foot-note, Mr. Chavasse lays claim to.

Pap, in some shape or other, is, doubtless, an important part of the dietary of children; but I was not aware that any one in the nineteenth century laid claim to a patent right in the description of its manufacture. At any rate, it may positively be affirmed that the literature of this and other countries affords, from a very early period to the present time, abundant evidence that pap of all kinds,—bread pap, boiled-flour pap, baked-flour pap, rusk pap, rice pap, pap with milk, pap without milk, sugared pap, non-sugared pap, pap with loaf sugar, pap with raw sugar; in fact, paps of every conceivable form and shape,—have been used and described in innumerable formulæ.

My nine pap formulæ were given in a foot-note, because I did not think them worth a place in the text of the work; nor did I think it necessary to specify that any one member of our Profession, or any one old nurse in particular, was entitled to any great amount of credit and immortality for describing the precise number of spoonfuls of flour which should be used in this pap, how many grains of sugar in that pap, the exact number of minutes the third pap should be boiled, or whether the fourth pap should be made with new or with skimmed milk,—when, in fact, every old woman in the kingdom could extemporise at least twenty such formulæ. Moreover, if I had thought it necessary to specify any authorities whatever on pap—if I had deemed the modes of making pap less insignificant than Mr. Chavasse seems to think they are,—I should have found the list of authors, and among them many lady writers, by far too extensive for insertion in a practical manual for the mother. I can assure Mr. Chavasse, too, that many—very many—writers would justly have claimed precedence of himself in reference either to priority in time or value of materials.

In a letter to Mr. Chavasse last month, and pending legal proceedings which he had commenced, I concluded with these words:—"I am now engaged in preparing a second edition, and all I can say is, that if it can be made to appear that anything has crept into my work which ought not to have been there, and to which alone you are solely entitled, I will amply, and to your heart's content, set you 'right with the Profession and the public.'"

It appears, however, that he was not satisfied with this. I will gladly give him his choice of the following propositions, viz. :—

First. To expunge from my next edition the four pap-formulæ, the patent right in the description of which he claims. Their absence will make a long and ugly foot-note somewhat shorter, and more elegant.

Secondly. To write a short essay on the "History of Pap;" in which essay I will undertake to do the amplest justice to Mr. Chavasse's claims. The literature of the subject is most interesting, and a thousand copies of such essay shall be circulated among the Profession, and the same number among the public.

One of these propositions, I trust, will meet Mr. Chavasse's wishes, and set him perfectly "right with the Profession and the public."

I am, &c.

T. HERBERT BARKER, M.D.

Bedford, September 10, 1859.

REPORTS OF SOCIETIES.

HARVEIAN SOCIETY.

MAY 19, 1859.

Dr. E. HART VINEN, President, in the Chair.

THE PECULIARITIES AND SEQUELÆ OF DIPHTHERIA.

DR. HEADLAM GREENHOW related a case of diphtheria in which albuminous urine appeared at an early stage of the disease, thus distinguishing it from scarlatina. He had seen about one hundred and fifty cases, and in one-third of these albumen was found in the early stage, whereas it was never found in scarlatina until the later stages of the disease. Another peculiarity in the case was, that a superficial scratch on the thumb extended rapidly to the cutis, and became covered with a thick tenacious membrane of a fibrous and corpuscular character, which was torn from the subjacent cutis with much difficulty. He related the case as a good type of a great number which he had had the opportunity of observing. Sudden death when the patient was apparently convalescing was not uncommon in this disease. A girl who had been suffering had recovered sufficiently to be up and about the house, when she suddenly sank and died. A boy had an attack and improved sufficiently to eat a meal of bread and milk during which he died. Another girl was getting better after an attack, and died whilst undergoing an examination of the throat. Dr. Greenhow inquired, "Is this a nervous or a vascular affection?" He inclined to think it was a heart affection. In the post-mortem examination of a case that died in Guy's Hospital, the heart was found softened and ecchymosed. There are, however, remarkable nervous sequelæ sometimes observed, such as partial amaurosis and even paraplegia; but generally these symptoms subside after a time. With reference to treatment he depended principally upon the sesquichloride of iron topically and internally, good living, and especially absolute rest.

An interesting discussion arose, supported by Dr. POLLOCK, Dr. CAMPS, and Dr. WADHAM.

Dr. POLLOCK then read his paper

ON THE ELEMENTS OF PROGNOSIS IN PHTHISIS, which he illustrated by the exhibition of several photographic portraits of patients in whom the disease had been arrested.

The following is an abstract of the paper :—

Dr. Pollock began by observing that the subject of phthisis had fallen into disrepute with medical men, who were accustomed to bestow the largest amount of attention only on what is new and striking. The prevalent idea that the disease is incurable, and that its progress is only a continuous declension towards the fatal result, also retarded new researches—the Profession conceiving that it was to be palliated, but never eradicated. This condition of the professional mind was most to be deprecated, as from it would spring no progress, and under its influences even an impartial examination of facts

became impossible. It were inflicting a mental blindness on ourselves to allow this state of things to continue without a protest occasionally from those who have large opportunities of seeing this disease. For some years the author had enjoyed these opportunities at the Consumption Hospital; and he proposed, without reference to theories, to offer a few rules for guidance in forming an opinion on the probabilities regarding the future course of any case of phthisis. The value of correct prognosis was very great, involving the personal interests of the patient and his friends, and the character of the Physician. The applause and the highest pecuniary rewards of the public also attend on our proficiency in solving these questions; and the author conceived that he should not exaggerate their importance if he stated that more fortunes had been made by scientific accuracy in prognosis, and more credit lost by mistakes in the same, than by all other incidents of professional life put together. The recent practice of insurance offices to accept diseased lives at an increased premium, also added to the importance of an accurate knowledge of the subject. To the attainment of this careful observation and precise knowledge, must be added individual tact. In speaking of consumption, he must be understood to mean a deposit of tubercle indicated by the known physical signs. The first stage meant a simple deposit; the second, its softening; the third, an excavation. Medical language and that of the public greatly confuse one another: the latter desiring to indicate the degree of danger alone. Patients die in all three stages: a fatal result often occurring with extensive deposit only, which had never softened—the sick person being thus in the first stage of tubercle, but in the last of the disease. Let it at once be stated that the degree of disease in the lung and the condition of the patient cannot be expressed by the same formula. Physical signs can never be the measure of the danger, any more than symptoms alone: both must be studied together. It was first necessary to ascertain the average duration of the disease—all stages and varieties being put together. Here we found great difference of opinions, of which the following is an abstract:—Portal says it may last from 1 to 40 years; Louis and Bayle in 314 cases found the mean to be 23 months—of these, more than half (162) terminated in 9 months, and the greatest proportion between the third and ninth month; the average duration was 18 months. Audeal, at La Charité, found the average duration 2 years; Sir James Clark, in the upper classes “enjoying advantages,” 3 years; Dr. Williams, assuming the average duration to be two years, considers (in the last edition of his work) that it has been doubled, or raised to four years, by the introduction of cod-liver oil as a remedy. Three years would be the medium of these opinions. The author inclined to place the duration at a much higher figure, and was satisfied that if cases were earlier recognised, they would be found to last much longer than now supposed. The method of invasion of the disease, and its progress, were next dwelt on. It was evident from the study of some thousand cases which have been under the author's care, that phthisis proceeds by a succession of attacks, and he doubts if even galloping consumption is ever present without a previous, but perhaps unnoticed attack,—an opinion which has been expressed by Louis. The symptoms and physical signs of such an attack of tubercle were then described, the patient presenting with slight dulness of percussion, prolonged expiratory murmurs, roughness of respiration, and slight increase of vocal resonance—the symptoms being fever, more or less severe, of a remittent form, cough, and slight evacuation, with or without an hæmoptysis. From this there is partial recovery, but the patient ever after remains below his normal standard of health. Dr. Pollock has seen perfect recovery occur, though rarely, the physical signs being occasionally quite removed. Now, it is obvious that if the subsidence of the attack were overlooked in prognosis, we might deliver a false opinion as to the danger of our patient. A second invasion of disease invariably occurs at a shorter or longer interval. The circumstances which might be considered favourable as regards duration (or the disease becoming chronic) were then dwelt on. These are the softening being limited in extent; the fresh deposit occurring in the same lung lower down; and a clear respiratory sound persisting at the base. The limitation of disease to one lung, whatever be its extent or stage, is more favourable for prolongation than if the affection be double, and the stage earlier. Two varieties of very chronic phthisis were then described. One,

a limited excavation, of well-defined characters, in one apex, the physical signs showing consolidation of the lung tissue below this, and the base being quite free from deposit; the other consisting in a cessation of all activity on the stage of softening, and a coincident improvement in symptoms. The physical signs evidence a diffused deposit, shown by a crepitation of a dry character, with here and there a bubble, intervals existing in which the respiratory sound is bronchial and dry, and nothing to indicate a cavity in any part. The expectoration is moderate, the cough confined to certain hours of the day, the health tolerable, but on a low par, but there is considerable dyspnoea on exertion. Dr. Pollock has known such cases last as long as fifteen or twenty years in persons who outlived middle age; and some interesting photographs were handed round, of young girls who had been for some years in this condition, who appeared in tolerable flesh, and were in good general health, the menstrual health becoming established, with improvement of all the symptoms. It would thus appear that there are two kinds of tubercle, one prone to rapid softening, the other presenting inert features. Dr. Pollock also cited cases to prove that there occasionally exist cases of strumous deposit in the lungs in young persons, analogous in all respects to that in the cervical glands, and which become slowly absorbed in the same manner. The prognosis in children must therefore be most guarded. The importance of examining the whole chest was then dwelt on in forming an opinion as to the probable duration of a case. The localisation of the deposit is worth observing. Softening most frequently begins at the posterior part of the apex, and its signs, when not discoverable under the clavicle, may often be found above the spine of the scapula. In tubercle which assumes a chronic form of diffused deposit, it is not uncommon to find the following order:—First, one apex; next, the opposite apex; third, the base of the side last attacked. The most chronic is, however, often diagonal, as right apex left base, left apex right base successively. A curious result of some thousand observations may be thus stated:—When the observed and customary order of physical signs is reversed, or in any important respect anomalous, the chances of prolonged life are greater. For example, when the base is first attacked and the apex secondarily, the case will be a long one. One anomaly, again, generally implies several, as when softening began at the base, there was often absence of hæmoptysis or of hereditary taint, etc. In a word, the more each case approaches to the ordinary type of the disease, the more rapidly fatal is it sure to be. The conditions which are either antagonistic to tubercle, or which are rarely found in combination with it, were then noticed, and the rule deduced that where any of these are present the case tends to great prolongation. Tubercle seems to monopolise the system. Skin disease (excepting syphilis and the milder rashes, as acne simplex, urticaria, and herpes), external suppurating scrofulous abscess, cancer, gout, tumours, aneurism, and eminently emphysema of the lung are among these. Acute rheumatism after a deposit of tubercle is rare, but not unfrequently precedes it. Of all these combinations that with emphysema tends to the greatest longevity. Persons with dark hair and eyes, although prone to phthisis, generally exhibit it in the chronic form. A freckled state of skin is rarely seen in the consumptive, and the influence of solar light as a counteractive agent was hinted at. Simple anemia is rarely found in the first stages of the disease; in the later it occurs as a symptom of blood impoverishment. Of tubercular symptoms it may be remarked, that an early profuse hæmoptysis is unfavourable. A single, late, profuse hæmoptysis is often accompanied by relief to the symptoms, and followed by a pause in the progress of the disease. Dry pleurisy (indicated by *frottement*) is theoretically an almost necessary occurrence to insure insulation of diseased parts, and is not unfavourable to prolongation of all favourable symptoms. A quiet pulse and the absence of fever are the most important. Hæctic often occurs early before physical signs are present. Its recurrence in advanced cases is invariably associated with either an advance in the stage of existing disease or with a fresh deposit. The wasting of the tissues in consumption has its meaning in keeping the system at a balance with the respiratory power, and a uniform spare habit of body is the most favourable for chronicity. With this is often associated a most valuable condition, which may be called nervous vitality, conferring on the system great powers of endurance.

Dr. POLLOCK next exhibited a table of the particulars of about 190 cases of phthisis under his care which had already lasted upwards of four years, each case being noted and examined by himself:—

<i>Cases over Four Years.</i>				
Males	111
Females	82
Under 20	25
Under 30	71
Under 40	60
Over 40	36
First stage	60
Second stage	56
Third stage	71
One lung affected	84
Both lungs affected	97
Hæmoptysis	124
None	65
Have taken cod-liver oil	144
Have not taken cod-liver oil	44
Diarrhœa	39
No diarrhœa	151
Larynx affected	21
Larynx not affected	170
Hereditary predisposition	69
No hereditary predisposition	113
Have taken cod-liver oil three months	82
Have taken cod-liver oil six months	37
Have taken cod-liver oil for years	32
<i>Degrees of Waste:—</i>				
First (slight)	97
Second (decidedly thin)	80
Third (extreme)	12
<i>Hectic, marked by Sweatings:—</i>				
Now	88
Formerly	30
Not	38

An analysis of the above table is in favour of males.

Advanced age shows increased toleration of phthisis. An individual is not only less likely to contract consumption after thirty-five; but if he has it the disease inclines to the chronic form. The remarkable number of seventy-one are found with cavities, and the emaciation was not in proportion to the stage, for only twelve were in the extreme of wasting. One half had never spat blood, the ordinary proportion of all cases together being about sixty-three per cent. This illustrates the rule of anomalous occurrences referred to above. The absence of hereditary taint is very remarkable. The secondary affections, diarrhœa and disease of larynx, were exceedingly rare. The pressure of hectic was also rare. Finally, the favourable conditions in phthisis may be thus summed up:—

From Physical Signs.

1. Limited quiescent deposit in one lung.
2. Limited well-defined cavity in one lung.
3. The sounds denoting softening becoming dryer in a one-sided deposit.
4. The concurrence of emphysema of the lower parts of the lungs with tubercle in the upper.
5. Any unusual localisation of physical signs.

From Symptoms.

1. The absence or rarity of fever.
2. The concurrence of skin diseases, external struma, gout, tumours, aneurism, fistula in ano.
3. The lymphatic temperament.
4. A spare habit of body without much variation in the weight.

Dr. GREENHOW, Mr. BALLARD, Dr. CAMPS, &c., having spoken,

The PRESIDENT announced that the session was at an end, and that the next meeting of the Society would be held in its new rooms in Tichborne-street, Edgeware-road, on the third Thursday in October.

LAST week orders were issued that the fresh rules and regulations for the newly-enrolled Medical Staff Corps were to come into operation directly.

THE SMETHURST CASE.

OUR readers will doubtless be much interested by the following letter from Dr. Todd, dated Vevay, Switzerland, September 5:—

Now that the fate of the unhappy culprit in the recent poisoning case at Richmond must have been decided (and at this distance I have no means of knowing how), it cannot be improper that I should ask you to admit into your columns a detailed statement of Medical facts and arguments which favour the verdict of the jury that he was guilty of the crime imputed to him, and that he effected his purpose by the administration of certain poisons.

In my evidence on the trial I stated that the poisons used were, in my opinion, antimony, arsenic, and corrosive sublimate.

Antimony was found in the tissues of the body; and the excessive vomiting from which Miss Bankes suffered was explained by the frequent administration of that poison.

Arsenic was found in one of the discharges from the bowels, and a peculiar morbid change in the lining membrane of the stomach was decidedly indicative of the irritation of arsenic. It is not improbable that the vomiting was partly due to arsenic; and the peculiar constriction in her throat, of which she complained frequently, was also in part, at least, due to that drug.

No trace of arsenic, however, was found in any of the organs or in the blood. But how could it have been, for with or after every dose there was given a certain quantity of antimony, which did not allow the metallic agent to remain long enough for its absorption, and barely sufficiently long to cause a slight irritation of the stomach and throat?

This poison was used, I have no doubt, very cautiously and in comparatively small quantities, and most probably only during the last ten or fourteen days. It was not intended to employ this agent otherwise than in aid of others, to promote their action and to confuse the medical attendants by modifying symptoms, and to divert the attention of the chemical investigators from the poison which was really the most destructive. Perhaps, also, it may have been thought that the employment of arsenic might embarrass the chemists, in drawing conclusions from their tests.

Of the third poison, the bichloride of mercury, commonly called corrosive sublimate, although it has been ignored by the chemists, and, notwithstanding that other medical witnesses for the prosecution have not seemed to attach importance to it, I have no hesitation in expressing my opinion that it was the principal agent in causing the death of the victim, aided very much by antimony and slightly by arsenic.

It must be admitted, however, that two most important points were wanting in the evidence in favour of this view; and it was the absence of these proofs which, no doubt, prevented the counsel for the prosecution from directing the attention of the jury more fully to the influence of this poison.

The proofs to which I allude were the detection of the mineral in the body of the patient, and the occurrence of that which so often follows the administration of mercurial agents—namely, salivation.

That no trace of mercury was found in the tissues or in the bowels I ascribe chiefly to its having been given in small doses, accompanied by more or less of antimony. It passed through the bowels rapidly, and was either not at all absorbed into the blood, or in such very minute quantities as admitted of a rapid elimination. Its action was, therefore, purely topical upon that part of the bowel towards which it has an affinity, and it is not improbable that its energy as a purgative was greatly increased by the combination with antimony, while its specific action in producing salivation was diminished by the same combination.

It is not improbable that Miss Bankes may have been one of those persons whom mercury cannot salivate.

But another drug was given which tended to prevent the salivation, the occurrence of which would have instantly led to the detection of the poison employed. This drug was chlorate of potash.

It had become known early in the inquiry that the prisoner had employed this drug without the sanction, and, if I am not mistaken, without the knowledge of the attending Medical men.

It had been suggested that the object of giving chlorate of potash was to promote the elimination of arsenic, and that the prisoner was aware of the fact (new to the most experienced chemical analysts) that chlorine will dissolve out arsenic from its association with copper.

The influence of chlorate of potash as an eliminator of arsenic is new in medicine, so far as my reading and experience inform me; and it seems to me highly improbable that this is true; nor do I believe that the drug was used for that purpose. Not less improbable is it that the prisoner, a man certainly not of a high order of education, nor devoted to scientific pursuits, should have been familiar with a delicate point of chemical analysis hitherto undiscovered. The admission of either or both of these propositions would tell materially against the prisoner, as indicating that his mind had been much directed to the study of poisonous agents.

That the chlorate of potash was used with reference to the administration of mercury and not of arsenic is clearly suggested to me by the testimony of the very last witness for the defence. It seems that as long ago as February last the prisoner was anxious to discover something which would correct a foul smell on the breath. He applied to the witness, a dentist, who recommended him chlorate of potash for this purpose.

Now, chlorate of potash is a known remedy for the foulness and fœtor of breath which arise from salivation. It is often used to moderate salivation, to promote the healing of the ulceration and sloughing of the mouth which accompany it, as a local application, and if given internally it is supposed by some to prevent or retard salivation.

This testimony (which had not been given while I was in court, and which I learnt from the newspapers after the conclusion of the trial) supplies an important additional link in the chain of evidence in favour of bichloride of mercury having been much relied upon by the poisoner. He knew how important it was to prevent salivation, and he did not wish to trust to antimony alone.

Is it impossible, even now, to find out where he got his chlorate of potash?

I would also ask, is it impossible to make a further search for mercury? If the body were disinterred, I should recommend that the salivary glands should be examined.

Additional proof that bichloride of mercury was used is furnished by the symptoms. These symptoms were those of a dysenteric diarrhoea of the most acute and irritant, and, at the same time, of a peculiar kind; and the most important question raised by the defence was as to the probability that this was, in reality, a case of disease arising from natural causes, and not from poisoning.

It will be remembered that the symptoms under which the deceased lady suffered were those of a severe and obstinate diarrhoea, accompanied by frequent bloody discharges, with incessant vomiting, and of the most distressing kind, to which must be added the frequent complaint of a peculiar burning sensation in her throat. There was abdominal tenderness, and, on one occasion at least, a peculiar rigidity of the abdominal muscles forcibly excited by the least pressure. These symptoms, it will be further remembered, not only resisted a variety of appropriate remedies, such as in the most severe cases generally give at least a temporary relief; but latterly, in the most mysterious way, they seemed aggravated by each medicine in succession to an alarming extent, and led to the objectionable practice of frequent change of remedies. Thus, among other instances, one or two pills, consisting of a quarter of a grain of sulphate of copper, and a third of a grain of opium, in all (if two had been taken) half a grain of the first and two-thirds of a grain of the second, seemed to produce a frightful increase of every symptom, including the peculiar burning sensation of the throat,—a result which no Medical man could believe would arise from such a cause, and which is equally opposed to all Medical experience and to the dictates of common sense.

The symptoms suggested to the Medical men in attendance the existence of ulceration of the bowel of great acuteness and extent; but the intense vomiting and the peculiar throat affection were inconsistent with the opinion that the case was one of ordinary dysentery, or, in other words, a very extraordinary case of acute dysentery. Looking at all the circumstances, Dr. Julius, Mr. Bird, and myself came independently to the conclusion that the symptoms were not those of a natural disease, but were excited and maintained by the frequent

administration of one or more irritant poisons of a nature to promote at once an excessive vomiting and severe diarrhoea.

We have now the additional information afforded us by the post-mortem examination. Acute sloughy ulcers of the upper part of the large intestine were found, and smaller and less numerous ulcers existed in the lower part of the same great division of the bowel.

The existence of such ulcers, and in such positions, was consistent with the supposition that the disease was dysentery, but they were too much in the upper part and too little in the lower part of the bowel. In fact, the position of the ulcers was reversed from that which they occupy in the natural disease. In dysentery the ulcers are chiefly accumulated to the lowest part of the large bowel, and are least numerous in its upper part. In this case the ulcers were most numerous above, and gradually diminished in number at the lower part. The ulcers also wanted a certain degree of thickening about them which belongs to disease.

Now, these ulcerations were exactly, both in position, nature, and relative number such as bichloride of mercury would produce. When this salt is given in small but poisonous doses, it seems to pass over the stomach and the small intestine (25 or 30 feet of bowel), and expends its action on the first part of the large bowel, sometimes the lower part of the small bowel, and in a less degree the lower part of the large bowel.

To put this matter in a plainer light, I will arrange in parallel columns the leading points which favour each view,—namely, those which indicate the use of a combination of antimony and bichloride of mercury, and those in favour of the natural disease.

POISONING.

Excessive and uncontrollable vomiting.

Severe dysenteric diarrhoea.

Absence or slight development of certain symptoms of dysentery.

Extreme rarity of very acute dysentery, especially as an isolated case, in this country.

Aggravation of symptoms on each change of remedy.

Frequent changes of remedies suggested by the poisoner.

Position occupied by the ulcers, being the reverse of that occupied by the ulcers of disease; absence of thickening of the edges of the ulcers.

Peculiar throat symptoms,—the sense of burning and constriction.

The peculiar terrified aspect of the patient, unlike that of abdominal disease.

DISEASE.

The dysenteric diarrhoea and evacuation of blood

The existence of ulcers in the large intestine.

To explain the excessive vomiting, the defence suggested that it was caused by early pregnancy. The advocates of this hypothesis forget that a major irritation with scarcely an exception, controls a minor, even although in a different organ; and in such a case as this there cannot be a doubt that the excessive intestinal irritation would have kept in abeyance that from the uterine condition, had it existed. Nor, I may add, is it likely that men of large experience would overlook an irritation of that kind.

It is true that a case apparently to a certain extent in point was adduced by one of the witnesses for the defence. This case was so imperfectly reported that I could draw no conclusion from it, and most certainly I should have my fears of "foul play," or "*mala praxis*," if I met with such a combination as uncontrollable sickness, excessive diarrhoea, and pregnancy.

I have thus endeavoured fairly to analyse this very serious case, and after the most careful consideration I find myself unable to arrive at any other conclusion than that Isabella Bankes died from the frequent administration of antimony and bichloride of mercury, with occasional doses of arsenic. Had iodide of potassium or iodine in any other form been occasionally added, the effects of the other poisons would have been enhanced.

I trust this very important case will not be lost upon toxicologists, and that it will lead to new and careful observations upon the effects of poisons in combination, upon their mode of elimination, upon the means which may be used to prevent the accumulation of them in the tissues and organs of the body, and, finally, that it will induce analytical chemists

to review carefully all the processes hitherto in use for the purpose of detecting mineral and other poisons with a view to clear up every possible source of fallacy.

The interests of science and the good of mankind (the constant aim of the best cultivators of science), demand all this.

I need scarcely add that it will be infinitely more agreeable to me to learn that all my arguments are fallacious, and that the innocence of the prisoner has been proved, than that another life should be sacrificed.

MEDICAL NEWS.

APOTHECARIES' HALL.—Names of gentlemen who passed their examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 8th September:—

BURFORD, WILLIAM HOWSE, Oxon.
LEVER, REGINALD CROFT, Army.
MOORE, THOMAS, Hales Owen, Worcestershire.
PARK, JOHN STEELE, Ballarat, Australia.
WHITE, FRANCIS THOMAS, Rawtheth, Wickford, Essex.

The following gentleman also on the same day passed his first examination:—

COLBECK, THOMAS WILLIAM, Kensington.

APPOINTMENTS.

BROWN, AND ELLISON.—The Queen has been pleased to appoint Henry Brown and James Ellison, Esqrs., jointly, to be Surgeon and Apothecary in Ordinary to Her Majesty's Household at Windsor.

LONGMORE.—Surgeon Thomas Longmore, from the East Indies, is appointed head of the Medical Staff at the camp at Colchester, in the room of Dr. Taylor, ordered to Canada.

STEDMAN.—James H. Stedman was appointed Resident Medical Officer to the Royal Infirmary for Women and Children, Waterloo-road, on the 7th instant.

DEATHS.

CONNOLLY.—September 10, at Bourton-on-the-Hill, Staffordshire, George Strutt Connolly, M.D., M.R.C.S.

HUGHES.—September 3, Joseph Hugh Hughes, Surgeon in the Royal Navy. The deceased was grandson and heir of George Baron Sempill and Elliottstown, of Renfrew, N.B. The baronial estates were forfeited as a consequence of the Great Rebellion of 1745. Aged 88.

LADY SYDNEY MORGAN has bequeathed the manuscripts of her late husband to Dr. Robert Ferguson, M.D.

THE criminal classes of this country entail upon it an expense of not less than £10,000,000 per annum.

LAST week in London twenty-seven lives were lost through small-pox, chiefly through the neglect of vaccination by the parents.

A "MEDICAL PROTECTION ASSOCIATION" has been established in Ulster, and the first annual meeting held under very favourable auspices.

"WE shall soon," writes a French Medical Journal, "no doubt, embrace many of our brethren who will be brought back to their family hearths by the amnesty. Dear exiles, you are welcome! May the air of your country be sweet and pleasant to you!"

THE CHOLERA.—The latest advices from Mecklenberg state that the cholera is continuing its ravages there. In some villages half the inhabitants have been carried off. Agricultural operations are suspended, and the cattle let loose in the fields, there being no one to attend them.

"THE sulphurous mineral principle is much less abundant in the waters of St. Sauveur than in those of Luchon; and yet what a difference in the degree of excitement produced by them! What can be the cause?" asks the writer. He forgets, does this questioner, that the Emperor and Empress patronised St. Sauveur!

M. VELPEAU has been raised to the rank of Commander in the Legion of Honour. It is thought that the honour is especially significant in his case, on account of the prominent part which he has lately filled in reference to a certain "Black Doctor," notoriously patronised by the courtly nobility.

EFFECTS OF ARSENICAL CANDLES 200 YEARS AGO.—In 1670 Leopold fell ill, and all the skill of his Physicians failed in bringing back his health. As a last chance, a noted alchemist, who had been taken prisoner, was sent for by the Emperor. He at once saw that the candles which lighted the dark room gave a strange flame. He called for fresh candles, and by analysing the others found that their wicks had been steeped in a solution of arsenic. In less than a month the Emperor was in good health.—*Secret History of the Austrian Government, by A. Michiels.*

POCKET ELECTRO-MEDICAL APPARATUS.—M. Despretz has recently submitted to the Paris Academy a new Electro-Medical apparatus, invented or combined by Ruhmkorff, and reduced to its simplest condition. A small box, in size about four cubic inches, contains—1. An induction coil; 2. A small Bunsen's pile of zinc and charcoal, in which nitric acid is replaced by M. Marié-Davy's sulphate of mercury; 3. Some handles, a brush, and some needles for distribution of the direct currents, or of the extra current to the surface of the patient. The manipulation of the apparatus is as simple as its construction. No vapours are disengaged. This apparatus will maintain its activity during a day. Its price is said to be moderate.

"INCREASE OF CRIMINAL LUNATICS.—Criminal lunatics (so called) have increased by 11·0 per cent. 146 were committed in the year (103 males and 43 females); 33 died, 1 escaped, 25 were discharged as sane, and 16 were removed as sane for trial or punishment. 686 remained under the charge of "mad doctors" at the end of the year. The 798 criminal lunatics reported on as coming within the category during the year included 130 murderers, 75 would-be murderers and maimers, 6 manslaughterers, 3 ravishers, 6 assaulters with intent to ravish, ten unnatural criminals, two treasonable and seditious offenders, 44 assailants, 5 indecent expositors of person, 41 burglars, 191 petty thieves, 37 incendiaries, 5 forgers, 42 rioters, 46 vagrants, 2 "dangerous persons at large," and 7 deserters. The cost of these lunatics was £22,122, of which part was defrayed by local rates, £10,271 by the public revenue, and £1519 derived from the private funds of the lunatics or their friends."

STUDIES ON LIGHT.—M. Niepce de Saint Victor, who has been long engaged in these studies, has succeeded in devising a method for measuring the action of light. He fills a flask with a solution composed of oxalic acid and nitrate of uranium, which produces, under the action even of diffused light, a disengagement of carbonic acid gas with effervescence. In order to assure himself that heat has nothing to do with this phenomenon, the vessel containing the solution was placed in a bath, and heated to the boiling point, but no disengagement of gas took place. There is in this fact the principle of an apparatus to measure comparatively the action of light. A graduated tube passing across the stopper of the flask receives the liquid, which, under the pressure of the gas disengaged, rises more or less, according to the power of the luminous rays, during a given space of time. Mr. Draper, of New York, has been also engaged in the same researches with a similar object.

FEES TO MEDICAL MEN.—At Marylebone County Court on Friday, Dr. Wall, a consulting surgeon, residing at Bayswater, proceeded against Mr. Gordon, a wine merchant, of Kildare-road, Westbourne-terrace, for the recovery of fees during attendance on the defendant's wife. The facts of the case were briefly these:—The defendant's wife cut her throat while on a visit to some friends in Berkshire, whence she was removed to London, and was attended by Dr. Wall, who visited her twice, and sometimes thrice, in the course of the day, at her request. The lady died, and the plaintiff charged 5s. for each visit, his claim amounting altogether to 15 guineas. The defendant refused to pay for more than one visit a-day, and it was contended that Medical men could not charge for more. Several Medical witnesses were examined with a view to prove that they may charge what fees they please, and for every visit.—The judge, Mr. J. L. Adolphus, was of opinion

that there is no law limiting the fees or the number of visits, and the jury gave a verdict for the plaintiff for the full amount.

NERVOUS EXCITEMENT AND THE RAILWAY.—"I dare say many will differ from me, that if there is not an actual increase of insanity, there is developed a very considerable tendency towards it; and I think it arises from the exaggerated state of society—the new state of society, in another aspect upon which we are entering. It is impossible not to see the effect that is produced by the immense speculation that takes place among all the various small trading-classes and people keeping costermongers' shops, and every one who has £5 that he can invest; they are carrying it on to a very great extent; and the number of disappointments, and the great ruin that have come upon so many people, and the horrible distress to which they have been subjected, have had a very considerable effect upon their minds; and society is living in a state of perpetual agitation. It does not signify whether it be political life or literary life. Every one must see, now, that life is infinitely more active and stirring than it used to be; the very power of locomotion keeps persons in a state of great nervous excitement, and it is worthy of attention to what an extent this excitement prevails. I have ascertained that many persons who have been in the habit of travelling by railway have been obliged to give it up, in consequence of the effect upon the nervous system. I was speaking to one of our commissioners the other day, who had just come off a journey, and he said that his whole nerves were in a state of simmer; and he was not able, without some period of rest, to enter upon business. I think all these things indicate a very strong tendency to nervous excitement; and in what it may issue I do not know; but I am quite sure, with regard to persons in that class of life entering into trade, and living in, and very constantly under, the influence of this stir and agitation, that the nervous systems of these persons are in a much more irritable state than they were twenty years ago. . . . The predominant cause among the richer classes of lunatics appears to be a disordered imagination, the pursuit of money, disappointed ambition, or great losses in trade, and sometimes you will find it from overwork."—*Evidence of Lord Shaftesbury on Lunacy.*

THE MILITARY HOSPITAL AT NETLEY.—Though it is likely to be four years yet before the great Military Hospital at Netley, near Southampton, is absolutely finished, the three and a-half years which have elapsed since the foundation-stone was laid have seen a great advance. The Hospital, which of itself is upwards of a quarter of a mile in length from end to end, is situated on a high and gently sloping bank of light gravelly soil, about 300 or 400 yards from high-water mark, and closed behind by a continuation of the hill, which is well and richly timbered. The building, in accordance with the established rules for such edifices, in order to give them the greatest amount of light and sunshine, runs due north and south. It is quite in the decorated Italian style, with purple bricks and Portland stone, the latter being used most extensively. The whole structure consists of a massive and highly decorated centre, with two main wings, the latter being each of three stories, about 600 feet long and 70 feet high, with a light ornamental belfry tower on the northern and southern extremities. The centre is of four stories and 216 feet wide, with a dome-shaped campanile rising above it to the height of 150 feet. A noble portico of double columns of Portland stone gives a good effect to this centre wing, if we may so term it, and most materially adds to the fine and imposing character of the whole design. The centre is intended mainly for the use of the officers connected with the Hospital, and for the surgical and medical stores, etc. In this part of the building, however, a large swimming-bath, 57 feet long by 34 wide, is placed for the general use of the inmates; and near this is the library, of the same dimensions, and 15 feet in height. In the vicinity of the swimming-bath also are placed a range of bath-rooms only to be used medicinally, such as sulphur-baths, acid-baths, etc., and which are quite distinct from the hot and cold baths, at intervals throughout the building. The north and south wings are the portions of the Hospital which will contain the great mass of the convalescents for whom it has been erected. Viewed from the outside, these wings seem all windows. In the front of the building alone there are no less than 200, four feet wide by eight high, opening into immensely long corridors, into which

the wards lead. This arrangement has been made the subject of many complaints, and it has been urged that the ventilation so obtained will be very defective. Besides these windows, however, there are many elaborate contrivances for ensuring a healthy circulation of air—hollow columns and girders, and perforated tiles being everywhere made the most of. The building itself occupies ten acres of ground, and some idea of its massiveness and extent may be formed from the fact that it will require upwards of 30,000,000 bricks and between 2,000,000 and 3,000,000 cubic feet of stone to complete it. The extent of ground around it, all of which, we believe, will be converted into terrace gardens, is no less than 193 acres. But a considerable time must elapse before the rose will bloom in this wilderness, now fruitful only in saw-dust, splinters, stone, and bricks. Before the garden can be made, too, the drainage of the building must be perfected. All the drains are to meet in one main sewer, which carries it into the Solent beyond low-water mark. As regards that very vexed question, the healthiness of the site, it is alleged by one party that the sewage of Southampton sends a powerful odour around the Hospital; by the other, that the great banks of mud, which every visitor to Southampton will remember, are really of inorganic materials, and without smell.

PHARMACIENS' EMBLEMS.—Pharmaciens have at all times placed a serpent over their doors; our books still bear the impress. This serpent was the attribute of Æsculapius, and the symbol of prudence; and we must therefore not be surprised if our forefathers went so far as to hang up in their houses the skins of stuffed serpents. There were always, however, those who rejected these *souvenirs* of Paganism, and placed their houses under the protection of some favourite saint. Thus, St. Christopher, a handsome figure, well cut and painted by one of the best sculptors of France, decorated the *façade* of the shop of the Sieur Thibouce, master apothecary, in 1550. Others of a more simple cast of mind affected the venerable mortar—material emblem of their profession,—and decorated it with lilies, with Maltese crosses, and the following inscription, which may be still read on some of these utensils:—"I take pleasure in well serving my master."—*Gaz. Méd.*

VITAL STATISTICS OF LONDON.

Week ending Saturday, September 10, 1859.

BIRTHS.

Births of Boys, 875; Girls, 826; Total, 1701.

Average of 10 corresponding weeks, 1849-58, 1531.0.

TO CORRESPONDENTS.

- M.—Only £10, now that the Stamp Duty is remitted.
- H. B.—No,—he can only sign "Licentiate of the Apothecaries' Company."
- Dr. Young.—A reply to Dr. Gillespie will be inserted as a matter of course.
- A Lover of London.—The licence of the Edinburgh College is no longer given without examination.
- Dr. Doig's paper on Turning has been accidentally mislaid, and the address cannot be found. Can another copy be sent?
- Mater.—"Rub your sore eye with your elbow," is a useful domestic old proverb. It means that you had better let the rubbing alone.
- Pons.—During the late great heats in Paris, we hear that Doctors and Apothecaries have reaped a fine harvest: "The Parisian has ill supported the excessive heat of the month of July."
- Mr. M.—Archbishop Tennison was bred a Physician, and practised as such in the time of Cromwell. During the horrors of the plague at Cambridge he acted both as Physician and clergyman.
- J. P.—Eleven of the jurymen who assisted at the famous inquest at Richmond, have written to the *Times* to say they have in no way whatever altered the opinion which they then formed concerning the guilt of Dr. Smethurst.
- Countryman.—Some of our benevolent French Confrères begin to think that it is time the word "Incurables" was effaced from the *Hospice des Incurables*. They think, and truly, that the term grates harshly on the public ear, and sounds like a "*lasciate ogni speranza*," to the poor who pass under the portals of the Asylum.
- T. Y. S.—Professor Dove, of Berlin, has made experiments to show that the ear, like the eye, and the organ of smell, may, under certain conditions, lose its proper power—audition. The eye, as we well know, becomes insensible to colours when long fixed on one colour; and Professor Dove now shows, that the ear, subjected for a long time to one sound, at length ceases to appreciate its existence.

HYPODERMIC TREATMENT.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I have read with much interest the papers on the Hypodermic Treatment of Disease lately published in your Journal. Mr. Hunter would confer a favour on many if he would state the precise way in which he introduces his injection, and the quantity of fluid introduced.

September 4.

I am, &c.,

MEDICUS.

"THE VACCINATION ACT."

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I have been induced to offer some remarks on a previous occasion, in your valuable Journal, respecting the Vaccination Act, as at present in force in the different Unions throughout the country; and I ventured to offer some remarks which, it appeared to me, might be of material advantage, both to the Medical Officers, and the Boards of Guardians to adopt, in order to secure a more accurate return of the persons vaccinated in the different Unions, and a better means of enforcing the due employment of those means so necessary to prevent the increase and further propagation of small-pox.

I find (from enquiries which I have made among the different Registrars appointed to carry out the provisions of the "Vaccination Act," that as the law at present stands, they have no check on the Medical Officers in

respect to the returns of their cases vaccinated; or rather, that unless the party vaccinated is a pauper, the Registrar has no means of ascertaining whether the operation has been performed or not; or, if that operation should be performed by other than a District Surgeon, no return is ever made; hence, not only is it a point of doubt whether the child has been vaccinated at all, but also the Registrar is deprived of his own legal sum of his registration fee, from the absence of the return being made by the Medical Officer to whom the certificate of vaccination has been taken.

Now the remedy I would adopt in all cases (as both being fair to the Medical Officer and the Registrar), whereby the due performance of the "Vaccination Act" would be effectually carried out, is as follows:—I propose, that any Medical Officer, whether attached to any Union or District, or not; or whether practising solely on his own responsibility (provided he be registered under the New Medical Act), shall, on remitting to the Registrars a certificate that a child has been successfully vaccinated by him, for every such certificate be entitled to receive the sum of one shilling as a remuneration for such written certificate. The payments to the Medical Officers of Unions for Vaccination to be as at present constituted: the fee of one shilling being only applicable to those Medical Officers who are unattached to any Union, or district appointment, under the direction of the Poor-Law Board.

I am inclined to believe, that by this small acknowledgment for their services, the Registrars would not only receive back their certificates of successful vaccination, duly attested; but the Guardians of the different Unions would also have the opportunity of knowing that all within the range of their respective districts were properly and effectually vaccinated. By this means too, a saving would be actually made in the expenses of the vaccination, for, whereas at the present time, the sum of 2s. 6d. is usually paid for each case; by the allowance I have proposed one shilling only would be charged to the Parish account, the remaining sum being arranged between the patient and the Medical officer, in any way they think fit.

I think the small sum proposed to meet the existing evil could not be objected to by any constituted Board of Guardians; it appears to me that it would be entirely successful in getting the necessary returns; at the same time I am compelled to admit that, mean as the sum I propose is, hitherto not one farthing has been granted for the written certificate, as at present appointed by the provisions of the Vaccination Act.

I am, &c.

PERRY DICKEN, M.D.

Ashby-de-la-Zouch.

COMMUNICATIONS have been received from:—

APPOINTMENTS FOR THE WEEK.

September 17. *Saturday (this day).*

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

19. *Monday.*

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

20. *Tuesday.*

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

21. *Wednesday.*

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopaedic Hospital, 2 p.m.; Middlesex, 12½ p.m.

22. *Thursday.*

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; London, 1½ p.m.; Great Northern, 2½ p.m.

23. *Friday.*

Operations, Westminster Ophthalmic, 1½ p.m.

EXPECTED OPERATIONS.

King's College Hospital.—The following operations will be performed this day (Saturday):—

Mr. H. Lee—Removal of Breast; Perineal Section; Varicose Veins; Haemorrhoids.

Westminster Hospital.—The following operations will be performed on Tuesday, the 20th inst.:—

Mr. Holt—Stricture of Urethra. Mr. Hillman—Urethral Stricture (two cases).

St. Mary's Hospital Medical School.—

The WINTER SESSION will commence on MONDAY, October 3rd, at Eight o'clock p.m., with an INTRODUCTORY ADDRESS by Mr. URE. It is a distinctive characteristic of St. Mary's Hospital that the following Medical Appointments are annually conferred upon the Pupils free of every expense. The advantages of FIVE OF THESE APPOINTMENTS far exceed in money value as many SCHOLARSHIPS of Fifty Pounds each. There are four Resident Medical Officers who board (free of all expense) in the Hospital, three of whom are appointed for twelve months, and one (the Obstetric Officer) who is appointed for six months; four Non-Resident Medical Officers; a Medical and a Surgical Registrar; all of whom are appointed by the Weekly Board of Governors on the recommendation of the Medical Committee. Clinical Clerks and Dressers are selected from the best qualified Students. All the above offices are awarded after competition among the qualified Perpetual Pupils of the Hospital. Physicians—Drs. Alderson, Chambers, Sibson, H. Jones, Sieveking, and Markham. Surgeons—Messrs. Coulson, Lane, Ure, Spencer Smith, Walton, and J. Lane. Physician-Accoucheur—Dr. Tyler Smith. Ophthalmic Surgeon—Mr. White Cooper. Aural Surgeon—Mr. Toynbee. Surgeon-Dentist—Mr. Seacombe. Further information may be obtained on application to the Dean of the School, who will also furnish the names of Gentlemen in practice in the vicinity of the Hospital willing to receive Pupils to reside with them. SPENCER SMITH, Dean of the School.

St. Mary's Hospital, August, 1859.

Guy's Hospital.—The Medical Session

commences in OCTOBER. The INTRODUCTORY ADDRESS will be given by Dr. HABERSHON on SATURDAY, October 1, at Two o'clock. MEDICAL OFFICERS.

Physicians—Thomas Addison, M.D.; G. H. Barlow, M.D.; Owen Rees, M.D., F.R.S.; W. W. Gull, M.D. Assistant Physicians—S. O. Habershon, M.D.; S. Wilks, M.D.; F. W. Pavy, M.D. Surgeons—Edward Cock, Esq.; John Hilton, Esq. F.R.S.; John Birkett, Esq. Assistant Surgeons—A. Poland, Esq.; C. Forster, Esq.; T. Bryant, Esq. Obstetric Physician—Henry Oldham, M.D. Assistant Obstetric Physician—Braxton Hicks, M.D. Surgeon-Dentists—T. Bell, Esq. F.R.S.; J. Salter, Esq. Surgeon of the Eye Infirmary—John F. France, Esq.

LECTURERS.—WINTER SESSION. Medicine—Owen Rees, M.D. F.R.S.; W. W. Gull, M.D. Surgery—John Hilton, Esq. F.R.S.; John Birkett, Esq. Anatomy—Alfred Poland, Esq.; Cooper Forster, Esq. Physiology—F. W. Pavy, M.D. Chemistry—Alfred Taylor, M.D. F.R.S. Demonstrations on Anatomy—Mr. Durham and Mr. Moxon. Experimental Philosophy—Mr. Durham.

Gentlemen desirous of becoming Students must give satisfactory testimony as to their education and conduct. They are required to pay £40 for the first year, £40 for the second year, and £10 for every succeeding year of attendance, or £100 in one payment entitles a Student to a Perpetual Ticket.

Dressers, Clinical Clerks, Ward Clerks, Obstetric Residents, and Dressers in the Eye Wards, are selected according to merit from those Students who have attended a second year. A Resident House-Surgeon is appointed every six months from those Students who have obtained the College Diploma. Six Scholarships, varying in value from £25 to £40 each, will be awarded at the close of each Summer Session for general proficiency.

Two Gold Medals will be given by the Treasurer—one for Medicine and one for Surgery.

A Voluntary Examination will take place at entrance, in Elementary Classics, and Mathematics. The three first candidates will receive respectively £25, £20, £15.

Mr. Stocker, Apothecary to Guy's Hospital, will enter Students, and give any further information required. Guy's Hospital, July, 1859.

School of Physic in Ireland.—The

PROFESSORS will commence their Lectures and Hospital Attendance on MONDAY, November 7.

At 9 o'clock Sir Patrick Dun's Hospital will be visited by the Clinical Professors, who will deliver Clinical Lectures twice in each week. Lectures will be delivered during the Session—

At 10 o'clock by Dr. Law, on the Institutes of Medicine.
11 " " Dr. Osborne, on Materia Medica and Pharmacy.
1 " " Dr. McDowell, on Anatomy and Surgery.
2 " " Dr. Apjohn, on Chemistry.
2 " " Dr. Robert W. Smith, on Surgery.
3 " " Dr. Banks, on the Practice of Medicine.
4 " " Dr. Churchill, on Midwifery and the Diseases of Women and Children.

Dr. Harvey's Lectures on Botany, Dr. Brady's, on Medical Jurisprudence, and Dr. Apjohn's, on Practical Chemistry, will commence in April.

In compliance with a regulation of the Board of Trinity College, the Clinical Lectures at Sir Patrick Dun's Hospital will be continued during the months of May, June, and July, by the Clinical Lecturers for the year. Dissections and Demonstrations will be conducted by the Professor of Anatomy, assisted by the Demonstrators.

The Medical Library at Sir Patrick Dun's Hospital is open on Tuesdays and Fridays at three o'clock, for the delivery of books to Students, conformably with the regulations of the College of Physicians. By order of the Board of Trinity College and the College of Physicians, no Student will be permitted, after the 25th of November, to enter for any of the Winter Courses of Lectures.

All the Lectures (the Clinical Lectures excepted) will be delivered in the Medical Lecture Rooms of Trinity College.

Fees—Class Lectures, first course, £3 3s.; second course, £2 2s. Sir P. Dun's Hospital, £10 10s.; to Sophisters T. C. D. £3 3s. Clinical Lectures, each course, 3 months, £3 3s. Students in Arts T. C. D. have the privilege of attending gratuitously the Lectures of the University Professors.

WM. EDWARD STEELE, M.D.,
Registrar and Fellow, King's and Queen's College of Physicians,
Ireland.

University College, London.—Faculty

OF MEDICINE.—Session 1859-60.—The SESSION will OPEN on Monday the 3rd October, on which day Meetings of the Professors, Students of the Faculty and their friends, will be held at 3 and 8 p.m. The Courses of Lectures, &c. will commence on Tuesday, October 4. Classes, in the order in which Lectures are delivered during the day:—WINTER TERM.

Anatomy—Professor Ellis.
Anatomy and Physiology—Professor Sharpey, M.D. F.R.S.
Chemistry—Professor Williamson, F.R.S.
Comparative Anatomy—Professor Grant, M.D. F.R.S.
Surgery—Professor Erichsen.
Practical Physiology and Histology—Professor Harley, M.D.
Medicine—Professor Walshe, M.D.
Dental Surgery—Mr. G. A. Ibbetson.
Practical Anatomy—The pupils will be directed in their studies during several hours daily by Professor Ellis, and Mr. William F. Teevan, Demonstrator.

SUMMER TERM.

Materia Medica—Professor Garrod, M.D. F.R.S.
Pathological Anatomy—Professor Jenner, M.D.
Medical Jurisprudence—Professor Harley, M.D.
Practical Chemistry—Professor Williamson, F.R.S.
Midwifery—Professor Murphy, M.D.
Palæozoology—Professor Grant, M.D. F.R.S.
Ophthalmic Medicine and Surgery—Prof. T. Wharton Jones, F.R.S.
Botany—Professor Lindley, Ph.D. F.R.S.
Practical Instruction in Operative Surgery—John Marshall, F.R.S.
Analytical Chemistry—Professor Williamson, throughout the Session.
Logic, French and German Languages, Natural Philosophy, Geology, and Mineralogy, according to announcement for the Faculty of Arts.

CLINICAL INSTRUCTION.

Hospital Practice daily throughout the year.
Physicians—Dr. Walshe, Dr. Parkes, Dr. Garrod, Dr. Jenner.
Obstetric Physician—Dr. Murphy.
Assistant-Physician—Dr. Hare.
Surgeons—Mr. Quain, Mr. Erichsen.
Consulting Surgeon to the Eye Infirmary—Mr. Quain, F.R.S.
Ophthalmic Surgeon—Mr. Wharton Jones.
Assistant-Surgeons—Mr. Marshall, F.R.S., Mr. Henry Thompson.
Dental Surgeon—Mr. G. A. Ibbetson.
Medical Clinical Lectures by Dr. Walshe, Dr. Garrod, and Dr. Murphy, also by Dr. Parkes, Professor of Clinical Medicine, whose special duty it is to train the pupils in the practical study of disease, and who gives a series of lessons and examinations on the physical phenomena and diagnosis of disease to classes consisting of a limited number, and meeting at separate hours.

Surgical Clinical Lectures, especially by Mr. Quain, and by Mr. Erichsen. Lectures on Ophthalmic Cases by Mr. Wharton Jones. Practical Instructions in the Application of Bandages and other Surgical Apparatus, by Mr. Marshall.

Practical Pharmacy.—Pupils are instructed in the Hospital Dispensary. Prospectuses may be obtained at the office of the College. Prizes.—Gold and Silver Medals for excellence in the examinations at the close of the courses in most of the classes.

Liston Gold Medal for Clinical Surgery.
Dr. Fellows' Medals for Clinical Medicine, two gold and two silver.
Filtriter Exhibition for proficiency in Pathological Anatomy, £30.
Longridge Exhibition for general proficiency in Medicine and Surgery, £40.
An Atkinson Morley Surgical Scholarship for the Promotion of the Study of Surgery, £45; tenable for three years.

Residence of Students.—Several of the Professors receive Students to reside with them, and in the office of the College there is kept a register of parties, unconnected with the College, who receive boarders into their families. Among these are several Medical gentlemen. The Register will afford information as to terms and other particulars.

A. W. WILLIAMSON, F.R.S. Dean of the Faculty.
August, 1859. CHAS. C. ATKINSON, Secretary to the Council.
The Lectures to the Classes of the Faculty of Arts will commence on Wednesday, the 12th October.
The Junior School will open on Tuesday, the 20th September.

Leeds School of Medicine.—Twenty-

NINTH SESSION, 1859-60.—The WINTER SESSION will commence on MONDAY, OCTOBER 3, 1859, when W. N. PRICE, Esq., President, will deliver the INTRODUCTORY LECTURE, at Twelve o'clock.

Physiology, General Anatomy, and Pathology, by Mr. Ikin, and Mr. C. G. Wheelhouse.

Anatomy, by Mr. Wm. Nicholson Price, and Mr. T. Pridgin Teale, jun.
Principles and Practice of Surgery, by Mr. Nunneley and Mr. S. Hey.
Chemistry, by Mr. Morley and Mr. Scattergood.
Principles and Practice of Physic, by Dr. Chadwick and Dr. Heaton.
Demonstrators, Mr. T. P. Teale, jun., and Mr. Hall.

SUMMER SESSION, 1860, Commencing May 1.

Materia Medica and Therapeutics, by Mr. Bishop.
Midwifery and Diseases of Women and Children, by Mr. Smith and Mr. Braithwaite.
Forensic Medicine and Toxicology, by Dr. Pyemont Smith.
Botany, by Mr. Wm. Hall.
Practical Chemistry, by Mr. Scattergood.
Operative Surgery, by Mr. Nunneley and Mr. Samuel Hey.
Fee to all the Courses required by the Examining Bodies, except Practical Chemistry, £42; ditto, ditto, for Library and Reading-room, £1.
Application for Tickets may be made to the Treasurer, Mr. Samuel Hey, Albion-place.

REGISTRAR.—DR. PYEMONT SMITH.

Clinical Instruction, in conformity with the regulations of the College and Hall, will be given at the General Infirmary; in Medical Cases by Dr. Chadwick and Dr. Heaton; and in Surgical Cases by Mr. Smith, Mr. T. P. Teale, and Mr. Samuel Hey.
CLINICAL CLERKSHIPS AND DRESSERSHIPS.—Three Clinical Clerkships and Dresserships are at the disposal of the Physicians and Surgeons to the General Infirmary, and are gratuitous.
Clinical Lectures are also given on Ophthalmic and Aural Practice, at the Eye and Ear Infirmary, by Mr. Nunneley.

Grosvenor Place School of Medicine.

No. 1, GROSVENOR PLACE (Adjoining St. George's Hospital).
WINTER SESSION, 1859-60.
LECTURES.

The INTRODUCTORY LECTURE will be delivered on MONDAY, OCTOBER 3rd, at Three o'clock, p.m., by Dr. COCKLE.

General Anatomy and Physiology—Dr. Richardson.
Descriptive and Surgical Anatomy—Dr. Halford and Mr. Lawson.
Practical Anatomy—Mr. Pittard.
Chemistry—Dr. Thudichum.

Principles and Practice of Medicine—Drs. Cockle and Leard.
Principles and Practice of Surgery—Mr. Spencer Wells & Mr. Adams.

FEES.—General Fee to all the Lectures required by the Universities of London and St. Andrews, the Royal College of Surgeons of England, and the Society of Apothecaries, 35 Guineas.

Special arrangements may be made for any one of the Examining Boards.

Prizes and Honorary Certificates will be awarded for general proficiency at the termination of the Session.

The Microscope is used to illustrate the Lectures and Demonstrations. The Dissecting Room and Museum of Anatomy are open to the Students during day-light, where their Studies are superintended by the Lecturers on Anatomy and Mr. Pittard.

The Lecturer on Chemistry has a Private Laboratory, where Students are instructed in Analytical and Physiological Chemistry.

Instruction in Pathological Anatomy is given by the Lecturer on Physiology.

Further information may be obtained at the School, 1, Grosvenor-place; or Dr. Richardson, 12, Hinde-street, Manchester-square, W.; or at the Residences of the different Lecturers.

London Hospital Medical and Surgical

COLLEGE, Mile-end.—1859-60.—The next WINTER SESSION will commence on MONDAY, October 3, 1859, when the INTRODUCTORY LECTURE will be delivered by Mr. CRITCHETT, at Three p.m.

Nicholas Parker, M.D.—Medicine.

Thos. Blizard Curling, F.R.S., George Critchett—Surgery.

John Adams—Descriptive and Surgical Anatomy.

Andrew Clark, M.D.—Physiology and General and Morbid Anatomy. Practical Histology.

John Sharman, John Couper—Practical Anatomy.

Henry Letheby, M.B. Lond.—Chemistry; Practical Chemistry.

H. J. Barrett—Anatomy and Pathology of the Teeth and Dental Surgery. F. H. Ramsbotham, M.D.—Midwifery and Diseases of Women and Children.

F. H. Ramsbotham, M.D., Henry Letheby, M.B. Lond.—Forensic Medicine.

Herbert Davies, M.D.—Materia Medica and General Therapeutics.

George Critchett—Ophthalmic Surgery.

Robert Bentley, F.L.S.—Botany.

J. Langdon H. Down, M.B.—Comparative Anatomy.

General Fee for attendance on the Medical and Surgical Practice, qualifying for the examinations at the London University, Royal College of Surgeons, and Apothecaries' Hall, and for perpetual attendance on all the Lectures, 84 guineas, payable in two instalments of 42 guineas each, at the commencement of the two first Winter Sessions of attendance.

Perpetual Fee to the Lectures alone, £50.

Students can make special entries to Lectures or Hospital Practice.

Further particulars and prospectuses can be had on application to Dr. Parker, Hon. Secretary, 22, Finsbury-square, E.C.; or at the College.

Westminster Hospital School of

MEDICINE.—The INTRODUCTORY ADDRESS of the Session 1859-60 will be delivered by Dr. RUSSELL REYNOLDS, on MONDAY, the 3rd of October, at 8 p.m.; and after the Address a CONVERSATION will be held, and the PRIZES of the past Session distributed.

The Westminster Hospital was instituted A.D. 1719, and incorporated by Act of Parliament A.D. 1836. It contains 175 Beds, and affords relief to about 20,000 Out-patients annually.

HOSPITAL PRACTICE.

Physicians—Dr. Basham, Dr. Fincham, Dr. Radcliffe.

Assistant-Physicians—Dr. Marcet, Dr. Reynolds.

Surgeons—Mr. Barnard Holt, Mr. Brooke, Mr. Holthouse.

Assistant-Surgeons—Mr. Hillman, Mr. Power.

Surgeon-Dentist—Mr. Clendon.

LECTURES.

Descriptive and Surgical Anatomy—Mr. Holthouse.

Practical Anatomy—Mr. Heath and Mr. Gray.

Dental Surgery—Mr. Clendon.

Chemistry—Dr. Marcet, F.R.S.

Surgery—Mr. Barnard Holt, and Mr. Brooke, M.A. F.R.S.

Physiology and Physiological Anatomy—Mr. Power.

Medicine—Dr. Basham.

Botany—Mr. Syme, F.L.S.

Comparative Anatomy and Zoology—Mr. Power.

Natural Philosophy—Mr. Brooke, M.A. F.R.S.

Materia Medica and Therapeutics—Dr. Radcliffe.

Forensic Medicine—Dr. Fincham and Dr. Reynolds.

Practical Chemistry—Dr. Marcet, F.R.S.

Midwifery—Dr. Frederic Bird.

Clinical Lectures.—In addition to the instruction given by all the Medical Officers during their visits, Courses of Lectures on Clinical Medicine and Surgery, in accordance with the new regulations of the Examining Boards, will be delivered during the Winter and Summer Terms by the Physicians and Surgeons.

Clinical Assistants, Physicians' Clerks, and Surgeons' Dressers, are selected from the most qualified Students, without additional Fee.

The Entire Course of Study (including Hospital Practice and Lectures) required by the College of Surgeons and the Society of Apothecaries, may be attended on payment of Seventy Guineas.

Further information may be obtained on application to

F. J. WILSON, Secretary to the Hospital.

King's College, London.—Medical

DEPARTMENT.—The WINTER SESSION, 1859-60, will commence on SATURDAY, OCTOBER 1, 1859, on which day all Students are expected to attend the Introductory Lecture, at Two o'clock.

The following Courses of Lectures will be given:—

Anatomy—Professor Richard Partridge, F.R.S.

Physiology; General and Morbid Anatomy—Professor Lionel S. Beale, M.D.

Chemistry—Professor W. A. Miller, M.D. F.R.S.

Principles and Practice of Medicine—Professor George Budd, M.D.

Principles and Practice of Surgery—Professor William Fergusson, F.R.S.

KING'S COLLEGE HOSPITAL.

Physicians... { George Budd, M.D. F.R.S. } With care of In-Patients.
{ R. B. Todd, M.D. F.R.S. }
{ George Johnson, M.D. }
{ W. A. Guy, M.B. F.R.S. } With care of Out-Patients.
{ Lionel S. Beale, M.B. F.R.S. }

Physician for Diseases of Women and Children and Physician-Accoucheur—Arthur Farre, M.D. F.R.S.

Assistant-Physicians—Charles Murchison, M.D.; Conway Evans, M.B.

Surgeons ... { W. Fergusson, F.R.S. } With care of In-Patients.
{ Richard Partridge, F.R.S. }
{ William Bowman, F.R.S. }

Assistant-Surgeons—John Wood, F.R.C.S.; John W. Hulke, F.R.C.S.

Surgeon-Dentist—S. Cartwright, jun.

The Hospital is visited daily. Clinical Lectures are given every week, both by the Physicians and by the Surgeons. The Physicians' Assistants and Clinical Clerks, the House-Surgeons and dressers, are selected by examination from the Students of the Hospital.

SCHOLARSHIPS.—New Students will have the privilege exclusively of contending, in October, 1859, for five Warneford Scholarships—viz., two of £25 per annum, for three years, and three of £25 per annum, for two years. The Examination will commence on the 29th of September, in Divinity, Classics (subjects the same as for the Matriculation Examination this year at the University of London), Mathematics, History, and the Modern Languages.

One Scholarship of £40, tenable for two years; one of £30, for one year; and three of £20 each, for one year, will be filled up in April next, the subjects of the Examination being exclusively Medical.

Further particulars may be obtained from J. Harley, Esq., Sub-Dean of the Department; and a detailed Prospectus will be forwarded by application to J. W. Cunningham, Esq., Secretary.

R. W. JELF, D.D., Principal.

St. Thomas's Medical Session.—A GENERAL INTRODUCTORY ADDRESS will be delivered by Dr. RT. DUNDAS THOMSON, on SATURDAY, 1st October, 1859, at Three o'clock p.m., after which the Distribution of Prizes, &c. will take place. Gentlemen have the option of paying £40 for the first year, a similar sum for the second, and £10 for each succeeding year; or £90 at one payment, as perpetual.

PRIZES AND APPOINTMENTS FOR 1859-60.

Voluntary Matriculation Examinations are held early in October, and Prizes are given in each of the three following divisions:—

1st. In Mathematics, Classics, and Ancient History. The President's Prize of 20 Guineas.

2nd. In Physics and Natural History. A College Prize of £20.

3rd. In Modern Languages and Modern History. A College Prize of £20.

To the three most distinguished Pupils for General Proficiency in each year, the following Prizes are awarded:—

FIRST YEAR'S STUDENTS.

1st. The Treasurer's Prize of 30 Guineas. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

SECOND YEAR'S STUDENTS.

1st. A College Prize of £30. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

The Dressers and the Clinical Clerks are awarded to merit, after examination.

THIRD YEAR'S STUDENTS.

1st. A College Prize of £30. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

Clinical Assistants, a Prize of £10, and £5 to the two most meritorious. Mr. Geo. Vaughan's Cheselden Medal. The Treasurer's Gold Medal.

Mr. Newman Smith's Prize of £5 for the best Essay on "Neuralgia."

The two House-Surgeons, the Resident Accoucheurs, and the Dressers, are periodically selected, and are provided with rooms and commons in the Hospital, free of expense.

A Hospital Registrar, at an annual salary of £80.

Students of each year are classed according to their respective total merits in the examinations, and all of the First Class receive Certificates of Honour.

MEDICAL OFFICERS.—Dr. Roots, Consulting Physician; Mr. Green, Consulting Surgeon; Dr. Barker, Dr. J. Risdon Bennett, Dr. Goolden, Mr. South, Mr. Mackmurdo, Mr. Solly, Mr. Le Gros Clark, Mr. Simon, Dr. Peacock, Dr. Bristowe, Dr. Waller, Mr. Whitfield.

Clinical Instruction is given at stated times by the Medical and Surgical Officers; and a systematic Course of Medical Clinical Lectures, by Dr. Barker. Ophthalmic Surgery, Mr. Mackmurdo; Midwifery, Dr. Waller and Mr. H. Gervis; Dental Surgery, Mr. Patient; Medical Tutor, E. Clapton, M.D.

Lecturers on Clinical Medicine—Dr. Barker. Medicine—Dr. J. Risdon Bennett. Surgery—Mr. South. Physiology—Mr. Grainger and Dr. Brinton.

Descriptive and Surgical Anatomy—Mr. Le Gros Clark and Mr. S. Jones. Chemistry and Practical Chemistry—Dr. Rt. Dundas Thomson. Midwifery—Dr. Waller. Practical Midwifery—Mr. H. Gervis. General Pathology—Mr. Simon. Botany—Dr. Bristowe. Comparative Anatomy—Mr. W. M. Ord. Materia Medica—Dr. Peacock. Forensic Medicine—Dr. Brinton. Public Health—Dr. Headlam Greenhow. Anatomical Demonstrations—Mr. Rainey and Mr. W. M. Ord. Demonstrations Morbid Anatomy—Dr. Bristowe and Mr. S. Jones. Microscopical Anatomy—Mr. Rainey.

Students can reside with some of the Officers close to the Hospital. The Patients are admitted daily at Half-past Nine a.m., and the Out-Patients seen at the same time.

To enter, or to obtain Prospectuses and further information, apply to Mr. Whitfield, Medical Secretary, resident at the Hospital.

The Middlesex Hospital, Session

1859-60.—The Session opens on MONDAY, October 3rd, with an Introductory Address by Mr. HENRY, at Eight o'clock, p.m.

The Hospital, from recent enlargements, contains upwards of 300 beds, of which 185 are for Surgical and 120 for Medical cases. The Cancer establishment receives 33 patients. Wards are specially appropriated to cases of Uterine Disease and of Syphilis. 2109 in-patients were admitted during the past year; the number of out-patients during the same period amounted to 16,469.

MEDICAL OFFICERS.—Dr. Stewart, Dr. Goodfellow, Dr. H. Thompson, Dr. Frere, Dr. F. Weber, Dr. Charles Coote, Mr. Shaw, Mr. De Morgan, Mr. Moore, Mr. Henry, Mr. Nunn, Mr. Flower.

Post-mortem Examinations are conducted by Dr. Coote.

LECTURERS.—Clinical Medicine: the Physicians to the Hospital.—Theory and Practice of Medicine: Dr. Stewart and Dr. Goodfellow.—Clinical Surgery: the Surgeons to the Hospital.—Surgery: Mr. Shaw.—Physiology: Mr. De Morgan.—Anatomy: Mr. Moore.—Practical Anatomy: Mr. Nunn and Mr. Flower.—Pathological Anatomy: Mr. Sibley.—Chemistry: Mr. Taylor and Mr. Heisch.—Midwifery: Dr. Frere.—Materia Medica: Dr. H. Thompson.—Medical Jurisprudence: Mr. Henry and Dr. Coote.—Practical Chemistry: Mr. Taylor and Mr. Heisch.—Botany: Mr. Bentley.—Histology: Dr. W. Woodham Webb.—Comparative Anatomy: Mr. Flower.

General Fee for attendance on the Hospital Practice and Lectures required by the College of Surgeons and Apothecaries' Company, £81. This sum may be paid by instalments of £35 at the beginning of the first session, £35 at the beginning of the second session, and £11 at the beginning of the third session. For every additional session, £10.

This fee admits the Students to the Practical Chemistry course, and to all other Lectures delivered in the College except Comparative Anatomy.

All general Students are required to perform the duties of Clinical Clerks and of Dressers during each winter and summer session, except the first winter session.

RESIDENT CLINICAL ASSISTANTSHIPS.

For the encouragement of Clinical Study, and for the promotion of Clinical Instruction in the Hospital, the Governors have instituted Three Clinical Assistantships, to be awarded on competition to Students who have completed their education in the School. It will be the duty of the Clinical Assistants to observe and record the cases in the Hospital, and generally in the absence of the Medical Officers, to carry out the treatment directed by them. They will reside and board in the Hospital for one year free of expense.

Two House Surgeons are elected by competition from among the Students who have completed their curriculum, and reside and board in the Hospital free of expense. Fee, Twenty Guineas.

Prizes and Certificates are also awarded to the Students who have most distinguished themselves, at written periodical Class Examinations, in all the subjects of study embraced in the Session.

The Governor's Prize of Twenty Guineas will be awarded to the Student who, having distinguished himself generally by conduct and acquirements in the College, shall present the best joint Clinical Reports in Medicine and Surgery.

Parents and Guardians who propose sending Pupils to the Hospital may communicate with the Dean, or with Mr. De Morgan, Treasurer to the College at the Hospital, daily from One to Three o'clock. Information may also be obtained on application to any of the Lecturers, or to Dr. Corfe, the Resident Medical Officer.

All students on entering will be required to sign an undertaking to conform to the laws relating to the discipline of the Hospital and College.

T. W. NUNN, Dean.

Anderson's University, Glasgow.—

The MEDICAL SESSION begins on TUESDAY, NOVEMBER 1st.

Anatomy and Practical Anatomy, by Drs. M. S. and George Buchanan.

Chemistry and Practical Chemistry, by Dr. Penny.

Materia Medica, by Dr. Morton.

Institutes of Medicine, by Dr. E. Watson.

Surgery, by Dr. Hunter.

Midwifery, by Dr. Paterson.

Practice of Medicine, by Dr. Anderson.

Military Surgery, by Dr. McLeod.

In SUMMER.—Botany, by Dr. Bell; Medical Jurisprudence, by Dr. Cowan. Fee for each Class, £2 2s. The Fees for all the Classes required for Diploma amount to £30. A Syllabus of the Lectures and particulars may be obtained from

ANDREW ANDERSON, M.D., Secretary.

Manchester Royal School of Medicine

and SURGERY, Grosvenor-street, Piccadilly. SESSION 1859-60.

The WINTER TERM will commence on MONDAY, October 3rd, when the Introductory Address will be delivered by Dr. THOMAS H. WATTS, at Twelve o'clock.

WINTER LECTURES.

Physiology—Mr. Turner and Mr. Smith.

Descriptive Anatomy and Dissections—Mr. Lund and Mr. F. A. Heath.

Chemistry—Mr. Stone.

Principles and Practice of Medicine—Dr. Watts and Dr. Browne.

Principles and Practice of Surgery—Mr. Dumville and Mr. Southam.

SUMMER LECTURES.

Obstetric Medicine—Mr. Heath and Dr. Whitehead.

Pathology—Dr. Roberts.

Materia Medica—Mr. Somers.

Forensic Medicine—Mr. Greaves and Mr. Morley Harrison.

Botany—Mr. Grindon.

Anatomy, Physiology, and Pathology of the Eye—Mr. Hunt and Mr. Lund.

Practical Chemistry—Mr. Stone.

Hospital Practice at the Royal Infirmary, where Clinical Lectures on Medicine and Surgery are regularly delivered by the Physicians and Surgeons of the Institution.

SCHOLARSHIPS.—In addition to Prizes for general proficiency and Certificates of Honour, three Scholarships for Perpetual Students will be offered for competition: one of £20, for third-year's Students; one of £15, for second-year's Students; one of £10, for first-year's Students.

Further particulars may be obtained from Mr. Southam, 21, Lever-street, August, 1859.

Bristol Medical School.—The Winter

SESSION, 1859-1860 will commence on Monday, October 3. The following Courses of Lectures will be delivered:—

Medicine—Dr. Brittan.

Surgery—Mr. Clark and Mr. Prichard.

Descriptive and Surgical Anatomy—Mr. Coe and C. Leonard.

General Anatomy and Physiology—Dr. Martyn and Dr. H. Fripp.

Chemistry—Mr. Herapath.

Superintendence of Dissections—Mr. C. Leonard, Mr. T. E. Clark, and Mr. H. Ormerod.

At the conclusion of the Session, Prizes will be awarded in accordance with the regulations of the School.

Certificates of attendance upon the Lectures delivered at this School qualify for Examinations at the Royal College of Surgeons, the Apothecaries' Hall, the University of London, the Army, Navy, and India Boards. Fee for unlimited attendance upon all the Course of Lectures (except Practical Chemistry), Forty-five Guineas.

Students from a distance can be provided with board and lodging, under the recommendation of the Faculty of the School.

Information upon all particulars may be obtained upon application to the Honorary Secretary.

HENRY EDWARD FRIPP, M.D., Hon. Sec.

Medical School, Old Park, Bristol, September 4, 1859.

Liverpool Northern Hospital.—The

WINTER SESSION will commence on SATURDAY, October 1.

Clinical Lectures will be delivered by the Physicians and Surgeons.

Physicians—Dr. Dundas, Dr. Inman, and Dr. Broadbent.

Surgeons—Mr. Ellis Jones, Mr. D. Chalmers, and Mr. Millett-Davis.

Junior Surgeon—Mr. James Hakes.

Fees for Admission—Perpetual, 30 guineas; one year, 12 guineas; six months, 9 guineas.

For further particulars apply to the House-Surgeon.

Liverpool Northern Hospital, Sept., 1859.

Liverpool Royal Infirmary School of

MEDICINE.

SESSION OF 1859-60.

The INTRODUCTORY ADDRESS will be delivered by Dr. COLLINGWOOD, on October 1, at Two, p.m.

LECTURES—WINTER SESSION.

Principles and Practice of Surgery—Mr. Long.

Principles and Practice of Medicine—Dr. Inman.

Anatomy and Physiology

Pathology, Descriptive and Surgical Anatomy

Chemistry and Pharmacy—Dr. Edwards.

The Dissecting Room is Open Daily, from Eight, a.m. to Six, p.m.

SUMMER SESSION.

Midwifery and Diseases of Women—Mr. Batty.

Diseases of Children—Mr. Grimsdale.

Materia Medica and Therapeutics—Dr. Nevins.

Medical Jurisprudence—Dr. Cameron.

Toxicology—Dr. Edwards.

Botany—Dr. Collingwood.

Ophthalmic Medicine and Surgery—Dr. H. Taylor.

Practical Chemistry—Dr. Edwards.

Pathological Anatomy—Dr. Broadbent.

In addition to the Prizes in each Class, the following EXHIBITIONS are offered for competition annually:—

ROYAL INFIRMARY MEDICAL SCHOLARSHIP, value £42, consisting of a Gold Medal and Six Months' free Board and Residence, with Dressership and Clerkship, in the Royal Infirmary. Should the Scholarship be gained by a Resident Pupil of the Infirmary, Six Months' Payment (£31 10s.) will be returned to him.

FOUR EXHIBITIONS, value £31 10s. each, consisting of free Board and Residence in the Royal Infirmary for Six Months, with Dressership on award of the Medical Board.

For further particulars apply to Mr. Fletcher, 13, Morningson-terrace, Liverpool.

Royal Veterinary College, Great

College-Street, Camden Town, London. Patrons, Her Majesty the Queen, H.R.H. the Prince Consort. President, H.R.H. the Duke of Cambridge, K.G. The Lectures for the ensuing Sessions will commence at the above Institution on MONDAY, October 3rd, 1859. The INTRODUCTORY ADDRESS will be delivered by Professor Simonds, at 12 o'clock. Anatomy, Physiology, and Pathology of the Horse, Professor Spooner. Anatomy, Physiology, and Pathology of other domesticated Animals, Professor Simonds. Chemistry and Materia Medica, Professor Morton. Descriptive Anatomy and Physiology, Assistant Professor Varnall. Anatomical Demonstrations, Mr. Good. Perpetual Fee to all the Lectures, with Infirmary Practice, Clinical Instructions and Anatomical Demonstrations, Twenty-five Guineas.

Sept. 8th, 1859.

CHARLES SPOONER, Principal.

N.B. A Prospectus of the Course of Study necessary to qualify a Pupil for examination for the Diploma of the Royal College of Veterinary Surgeons will be forwarded on application.

Surgeons' Hall, Edinburgh.—Winter

SESSION, 1859-60. The INTRODUCTORY ADDRESS will be delivered by Dr. SKAE, on November 2nd, at 2 p.m. The Prospectus may be obtained on application to Dr. John Struthers, Secretary to the Medical and Surgical School.

Evening Demonstrations of Anatomy.

—Mr. CHRISTOPHER HEATH, Demonstrator of Anatomy at the Westminster Hospital, will resume his Evening Course of DEMONSTRATIONS and EXAMINATIONS upon the DISSECTED SUBJECT on Wednesday, the 5th of October. The Demonstrations take place on Monday, Wednesday, and Friday evenings, during the Winter Session, from Seven to Nine o'clock, at the Westminster Hospital. Entrance Fee (perpetual) Five Guineas.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary. Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

Royal College of Physicians of EDINBURGH.

At an EXTRAORDINARY MEETING of the ROYAL COLLEGE of PHYSICIANS of EDINBURGH, held on Friday, the 19th of August, the following Resolution was unanimously agreed to:—

"That, in accordance with the opinion expressed by the General Council of Medical Education and Registration, on the 8th August, the Royal College of Physicians of Edinburgh do institute an Examination in Practical Medicine, to be undergone by Candidates, other than University Graduates claiming exemption under the Charter of the College; and that the College agree to alter Law 8 of the Regulations for the admission to the Licence, in accordance with the preceding Resolution."

The opinion of the General Medical Council, as expressed on the 8th August, is all follows:—

"That the General Medical Council is of opinion, that for the future no Licence or Degree should be given by any of the bodies in Schedule (A) to the Medical Act, without Examination."

The eighth Regulation, regarding the conferring of the Licence of the College, ran thus:—

"For one year after the passing of these Regulations (20th April, 1859), Licentiates of any of the existing Licensing Boards may be admitted Licentiates of the College without Examination, provided that they do not derive any profit from the sale of Drugs or Medicine, and that they produce certificates of character and professional qualification satisfactory to the College."

In conformity with the above Resolution, all Applicants under Regulation 8, for the Licence of the Royal College of Physicians of Edinburgh, with the exception of Graduates of British Universities, will in future be required to appear before the Examiners of the College, and to pass an Examination in the Practice of Medicine.

The Stamp-duty on the Diploma having been remitted, the Fee payable by Licentiates is now Ten Pounds.

In name and by authority,
Edinburgh, August 19, 1859. D. R. HALDANE, M.D., Hon. Sec.

Mr. James Robinson, Dentist, has REMOVED from No. 7 to No. 5, GOWER-STREET, Bedford-square, London.

Wanted, a Gentleman, duly-qualified, to reside in a first-class Private Asylum in the immediate neighbourhood of London, as MEDICAL SUPERINTENDENT. Apply by letter only, addressed M.D., 60, New Bond-street.

A Student of Guy's, in his second year, is desirous of RESIDING with a MEDICAL MAN, for whom he can visit, attend Midwifery, and Dispense occasionally. Time for Lectures and Hospital Practice allowed, and his services equivalent to board and lodging. Can come at once if required. Address, A. J. D. Post-office, Birmingham.

Birmingham General Dispensary.—

The Office of JUNIOR RESIDENT SURGEON to this Institution is now VACANT by the Resignation of Mr. F. J. Orford. CANDIDATES to fill the Situation (who must be Members of the Royal College of Surgeons, and Licentiates of the Apothecaries' Company) are requested to send in Testimonials of Medical education and moral character, addressed to the Secretary, on or before TUESDAY, September 27th. The Election, which will take place on the 5th day of October, is vested in the Committee. Salary £100 per annum, with Furnished Rooms, Fire, Lights, and Attendance.

September 8th, 1859.

S. SPRATLY, Secretary.

Assistantship.—An M.D. and Surgeon

(Registered) of Edinburgh, 1851, who has had experience in Hospitals, and for some years in the Indian Army, is willing to become Assistant for a time to a Medical Man in good practice. Particulars can be stated in correspondence. Address to M.D., care of Messrs. Cay and Black, 65, George-street, Edinburgh.

Country Practice for Disposal, in one

of the richest and most beautiful parts of England. Has been many years established, and produces between £500 and £600 a-year, with great prospective advantages. It is well in hand, and a good introduction will be given. Price, about Two Years' Purchase. Apply to Beta, care of Gale, Baker, and Oldfield, Druggists, Bouverie-street, Fleet-street.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent, Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

West Riding Lunatic Asylum,

WAKEFIELD.—ASSISTANT MEDICAL OFFICER WANTED.—WANTED, at the above Institution, a second ASSISTANT MEDICAL OFFICER, who must be a single man, legally qualified and "Registered." Salary, £100 a-year, with board and furnished apartments.

Applications, stating age and qualifications, accompanied by Testimonials, must be forwarded to me, for inspection by the Magistrates, on or before Saturday, October 15.

By order,

BENJAMIN DIXON, Clerk to the Visitors.

Wakefield, September 6, 1859.

Medical Pupils.—A Lecturer at one

of the Birmingham Medical Schools has a VACANCY for a PUPIL. Any Gentleman who has spent part of his time in the country, and wishes for a comfortable home and superintendence in his studies during his attendance upon Lectures and Hospital Practice, will find this worthy of attention, and will be treated with upon liberal terms.—Address by letter, to Medicus, Library, Sydenham College, Birmingham.

Medical.—A Share in a large General

PRACTICE at the West End of London, may be obtained by a Qualified Gentleman, after twelve months' Introduction as trial, on adequate purchase. Apply to — Capes, Esq., 43, Lincoln's-inn-fields, W.C.

Medical.—Wanted, an Assistant, with

one or both Qualifications, willing to DISPENSE, and not under Twenty-five years of age. Apply to Messrs. Corbyn and Co., 300, High Holborn.

Resident Medical Officer.—Wanted,

for the Brixton, Streatham-hill, and Herne-hill Dispensary, a RESIDENT MEDICAL OFFICER. He must be a Registered Member of a Royal College of Surgeons, and a Licentiate of the Apothecaries' Company. The salary is £140 per annum, with Residence, and an allowance of £5 for coals. He will be required to provide a competent Dispenser at his own expense, and will not be allowed to engage in private practice. Diplomas and Testimonials certifying Professional competency and correct moral deportment, must be sent prepaid, to Mr. James Stephens, the Secretary, National Schools, Church-road, Brixton, S. on or before the 26th inst., on which day, at 7 p.m., the candidates will be required to appear before the Medical Committee. Further particulars may be obtained from Mr. James Stephens as above.

Wanted, a Pupil, at the Leeds Public

DISPENSARY. In addition to the ordinary routine of Surgery Work, he will have the advantage of a most extended field for Clinical observation; and, if desired, an opportunity of attending Lectures at the Leeds School of Medicine. Apply to Mr. John W. Hopkins, Resident Medical Officer, 171, North-street, Leeds.

Surrey County Lunatic Asylum, near

TOOTING, S.—ASSISTANT MEDICAL OFFICER WANTED.—He must be unmarried; a Member of one of the Royal Colleges of Surgeons, and a Licentiate of the Society of Apothecaries. Salary £120 per annum, with board, lodging, washing, and attendance. Applications and Testimonials to be forwarded, on or before Monday, the 26th instant, to the Medical Superintendent of the Asylum, who is ready to give any information that may be required as to the nature of the duties.

By Order, S. BRIDGLAND,

Dated, 12th September, 1859. Clerk to the Committee of Visitors.

Orphan or Invalid Children.—A Home

is offered in a First-class House in the Country, to ONE or TWO ORPHAN or INVALID CHILDREN. They would be associated with three healthy little girls and receive instruction from experienced Governesses and Masters, and be constantly superintended and unceasingly watched over by a Lady long accustomed to the care of the weak and suffering. The use of carriages, horses, a pony, &c. Excellent Medical attendance. As the advantages are very great, the terms must be commensurate. Address, U. E. V. Messrs. Davies and Co. Advertising Agents, 1, Finch-lane, Cornhill, E.C.

London: Printed by CHARLES REED and BENJAMIN PARDON of 1, 2, and 3, Lovell's-court, Paternoster-row, in the City of London, and published by JOHN CHURCHILL, at the Publishing Office, No. 11, New Burlington-street, in the Parish of St. James, in the City of Westminster.—September 17, 1859.

Valentin's Text-Book of Physiology.

Illustrated by 500 Figures, on Wood, Copper, and Stone. Translated by WILLIAM BRINTON, M.D., Joint Lecturer on Physiology at St. Thomas's Hospital.

"The best text-book of Physiology ever published."—Dublin Medical Quarterly.

London: Henry Renshaw, 356, Strand.

Just published, Third Edition, 8vo, cloth, 12s. 6d.

On the Action of Medicines in the

SYSTEM. By FREDERICK W. HEADLAND, M.D., L.R.C.P.

"Such a treatise as Dr. Headland's doubtless was wanted, and the vacancy has been filled by this gentleman in a manner which is as creditable to the scientific medicine of this country as it is honourable to himself."—Lancet.

"The Author's remarks all through this book appear to us sensible and to the point, and the entire work must command the most attentive consideration of the reader."—Dublin Medical Press.

John Churchill, New Burlington-street.

Just published, post 8vo, cloth, 10s. 6d.

On the Diseases of the Stomach, with

an Introduction on its Anatomy and Physiology. By WILLIAM BRINTON, M.D., Lecturer on Physiology at St. Thomas's Hospital, Physician to the Royal Free Hospital.

"As one of our first writers upon the structure, functions, and diseases of the alimentary canal, the author of the present treatise has for some time established his reputation. We recommend Dr. Brinton's work as an honourable addition to the really scientific literature of the day."—Lancet.

"These Lectures are intended to give a brief but complete account of what is at present known concerning the Diseases of the Stomach: the whole work will fully repay a careful study, and we heartily recommend it to our readers."—Medical Times and Gazette.

John Churchill, New Burlington-street.

Just published, fcap. 8vo, cloth, 5s.

An Introduction to Clinical Surgery;

with a Method of Investigating and Reporting Surgical Cases. By FURNEAUX JORDAN, Assistant-Surgeon to Queen's Hospital, Professor of Anatomy at Queen's College, Birmingham.

"Mr. Jordan's work is one likely to prove of great practical utility, and we cordially recommend it to the notice of our Profession."—Medical Times and Gazette.

"The publication of this work is very opportune for students now about to commence in our schools the study of Surgery. To them we earnestly recommend it as supplying, in a compact form, all that they require which any book can give for the purpose of becoming competent to analyse, duly value, and correctly register the phenomena of surgical affections, to the literature of which it is a highly interesting addition."—Dublin Quar. Jour. of Med. Science.

"The symptoms and phenomena of surgical diseases and injuries carefully arranged."—Brit. and For. Med.-Chir. Rev.

"It is written with great care and clearness, and will, without doubt, do its share—not a trifling one—of work in fitting the surgical student for the efficient practice of his art."—Brit. Med. Jour.

John Churchill, New Burlington-street.

Just published, 8vo, cloth, 15s.

A Manual of Psychological Medicine:

containing the History, Nosology, Description, Statistics, Diagnosis, Pathology, and Treatment of Insanity. With an Appendix of Cases. By JOHN CHARLES BUCKNILL, M.D. Medical Superintendent of the Devon County Lunatic Asylum; and DANIEL H. TUKE, M.D. late Visiting Medical Officer to the York Retreat.

"We congratulate our authors upon having so well sustained their high reputation by such a very valuable contribution to the literature of their country. The work is illustrated by a series of portraits of the different types of insanity, of great interest, and we commend it to our readers in the full assurance that they will derive pleasure and profit from its attentive perusal."—Med.-Chir. Review.

"This treatise must be regarded as one of the noteworthy publications of the day. . . . It will no doubt enjoy a very wide circulation, and this most deservedly."—The Lancet.

"Throughout, this work bears the evidence of much careful study and accurate observation, which cannot fail to obtain for its authors an increased reputation."—Psychological Journal.

John Churchill, New Burlington-street.

8vo, cloth, 10s. 6d.

On Diseases of the Alimentary Canal,

ŒSOPHAGUS, STOMACH, CÆCUM, and INTESTINES. By SAMUEL O. HABERSHON, M.D., F.R.C.P., Senior Assistant-Physician to, and Lecturer on Materia Medica and Therapeutics at, Guy's Hospital.

"The practitioner will find it a very valuable work of reference."—Medical Times and Gazette.

"A long life with much practice, or a shorter one with the observation of a vastly concentrated mass of facts, could alone furnish the *matériel* of this work. . . . We recommend Dr. Habershon's treatise as a valuable repository of clinical experience of very trustworthy character."—The Lancet.

"The work of Dr. Habershon treats of the diseases of the alimentary canal throughout its entire extent. In this respect it resembles that of Dr. Abercrombie, and on perusal it will be found to resemble it in the mode in which the subjects are discussed. In comparing this work to that of Dr. Abercrombie, we have already stamped it with a mark of high approbation."—Dublin Quarterly Journal.

John Churchill, New Burlington-street.

Just published, 8vo, cloth, 12s. 6d.

Demonstrations of Diseases in the

CHEST, AND THEIR PHYSICAL DIAGNOSIS. By HORACE DOBELL, M.D., Physician to the Royal Infirmary for Diseases of the Chest. Illustrated with coloured Plates of all the principal Diseases of the Lungs and Pleura. Each plate accompanied by a concise statement of the Physical Signs to be observed during Life, and followed by a corollary upon its leading points.

"We do not hesitate to say, that the student who, after the examination of a patient, refers to this book, will have a much greater facility in understanding the *rationale* of the phenomena and of interpreting them correctly, than one who is satisfied with comparing what he hears to the descriptions of sounds given in handbooks, or to some typical sound pointed out to him by his teacher. . . . What the author gives is well done, and in the right direction."—Brit. and For. Med.-Chir. Review.

"The present work will form a valuable addition to the existing literature on the subject. . . . The plates are taken from fresh specimens of disease, and are very well executed, the colouring of the engravings heightening their effect, and giving them all the appearance of reality."—Medical Times and Gazette.

John Churchill, New Burlington-street.

Just published, with Coloured Plates, 8vo, cloth, 14s.

A Treatise on the Pathology of the

URINE, including a complete Guide to its Analysis. By J. L. W. THUDICHUM, M.D. Lecturer on Chemistry at the Grosvenor-place School of Medicine.

"To the student and practitioner alike the Treatise is invaluable. It ranks from the first a standard work, every chapter of which indicates that its author has observantly studied his subjects in their practical bearings."—Med. Times and Gazette.

"This is a book which must gain a high reputation for the author. The plates, which are beautifully executed, are for the most part excellent representations of the various substances found in urine; and we thank him for the highly valuable treatise which he has offered to all scientific and truly practical Physicians."—Brit. Med. Jour.

John Churchill, New Burlington-street.

BY ROBERT LEE, M.D., F.R.S.

Clinical Midwifery: comprising the

Histories of 545 Cases of Difficult, Preternatural, and Complicated Labour, with Commentaries. Second Edition, fcp. 8vo, cloth, 6s.

"More instructive to the juvenile practitioner than a score of systematic works."—The Lancet.

"Will be consulted by every accoucheur who practises his art with the zeal which it merits."—Medical Times and Gazette.

"A storehouse of valuable facts and precedents."—American Journal of the Medical Sciences.

II.

ON OVARIAN and UTERINE DISEASES. Foolscape

8vo, cloth, 6s. 6d.

"The cases related amount to about five hundred; they constitute, we hesitate not to say, the most valuable and extensive collection of clinical facts that has yet been published in this department of medicine."—Dublin Medical Press.

III.

ON the EMPLOYMENT of the SPECULUM in the DIAGNOSIS and TREATMENT of UTERINE DISEASES. With 300 Cases.

8vo, cloth, 4s. 6d.

IV.

PRACTICAL OBSERVATIONS on DISEASES of the UTERUS. With Coloured Plates. Two Parts. Imperial 4to, 7s. 6d. each Part.

John Churchill, New Burlington-street.

Just published, with Engravings on Wood, 8vo, cloth, 5s.

On Amputation by a Long and a

SHORT RECTANGULAR FLAP. By THOMAS P. TEALE, F.R.C.S., Surgeon to the Leeds General Infirmary.

"The various amputations described by Mr. Teale have been admirably illustrated by the drawings of Mr. Bagg. . . . His work should be studied by every Surgeon."—Medical Times and Gazette.

"We heartily recommend Mr. Teale's mode of operating to the serious consideration of every hospital surgeon."—Brit. and For. Med.-Chir. Rev.

"The favourable statistics of the modified operation will undoubtedly lead surgeons to give Mr. Teale's method of amputation a fair trial, since the drawings of the stumps, photographed some months after the operation, are such as will compare most favourably with those obtained by any other procedure."—American Journal of Medical Sciences.

By the same Author, 8vo, cloth, with Engravings, price 2s. 6d.
ON PLASTIC OPERATIONS FOR the RESTORATION of the LOWER LIP, and for the Relief of several Deformities of the Face and Neck.

John Churchill, New Burlington-street.

Just published, Fourth Edition, post 8vo, cloth, 3s. 6d.

Homœopathy and Hydropathy impar-

tially appreciated. With Notes Illustrative of the Influence of the Mind on the Body. By EDWIN LEE, M.D.

Also, Fourth Edition, post 8vo, cloth, 7s. 6d.

THE WATERING PLACES of ENGLAND and their REMEDIAL RESOURCES.

John Churchill, New Burlington-street.

Just published, with Plates, 8vo, cloth, price 7s. 6d.

The Enlarged Prostate, its Pathology

and TREATMENT; with Observations on the Relation of this Complaint to Stone in the Bladder. By HENRY THOMPSON, F.R.C.S. M.B. Assistant-Surgeon to University College Hospital.

"A very elaborate consideration of the treatment of senile enlargement of the prostate."—Dublin Quarterly.

"Has materially advanced our knowledge of the structure of the enlarged prostate of advanced age."—Med.-Chir. Review.

"For the student and practitioner his work will prove one of exceeding value."—Glasgow Med. Journal.

"Possesses the great merits of accuracy, originality, and laborious investigation. A standard authority on the subject of which it treats."—The Lancet.

"Shows careful research, much thought, power of accurate observation, great practical tact, and sound judgment. The book should be read by every Surgeon who treats or hopes to treat cases of diseased prostate."—Medical Times.

"The best guide now on all these subjects."—Medical Circular.

"It bears on every page the impress of careful study, and of truth: to be appreciated, it must be read; and we most heartily and conscientiously recommend it to all those engaged in the treatment of diseases of this region."—Liverpool Med.-Chir. Journal.

"No preceding author has treated the subject of treatment so carefully and so satisfactorily."—American Journal of Medical Science.

"Has completely exhausted the subject of prostatic diseases. . . . We advise our readers to get the work and make themselves individually acquainted with its excellencies."—Montreal Monthly Journal.

John Churchill, New Burlington-street.

A List of the Principal Works of the

PRESENT SEASON in circulation at MUDIE'S SELECT LIBRARY.

The present rate of increase at this Library exceeds ONE HUNDRED THOUSAND VOLUMES per Annum, consisting Chiefly of Works of Permanent Interest and value.

Single Subscription, One Guinea per annum, commencing at any date. First-class Country Subscription, Fifteen Volumes at One Time, Five Guineas per Annum, of the best and newest Works; exchangeable (in sets) at pleasure.

Charles Edward Mudie, New Oxford-street, London; and Cross-street, Manchester.

TEXT-BOOKS IN ANATOMY, PHYSIOLOGY, SURGERY, CHEMISTRY, PHYSICS, ETC.

PRINTED FOR WALTON AND MABERLY,

28, UPPER GOWER STREET, AND 27, IVY LANE, PATERNOSTER ROW.

DR. GARROD ON GOUT, ITS NATURE
AND TREATMENT, INCLUDING THE DISEASES COMMONLY
KNOWN AS RHEUMATIC GOUT. 1 vol., small 8vo.

[October 15.]

DR. WALSHE ON DISEASES OF THE
LUNGS, including the Principles of Physical Diagnosis. Third
Edition, revised and much enlarged. 1 vol.

[Preparing.]

DR. WALSHE ON DISEASES OF THE
HEART AND GREAT VESSELS, including the Principles of
Physical Diagnosis. Third Edition, revised and greatly enlarged.
1 vol.

[Preparing.]

ERICHSEN'S SCIENCE AND ART OF
SURGERY. Second Edition, enlarged and carefully revised. Illus-
trated by 400 Engravings on Wood. 1 vol., 8vo. 14. 5s.

DR. QUAIN'S ANATOMY.

Sixth Edition. Edited by Dr. SHARPEY and Mr. ELLIS, Professors of
Anatomy and Physiology in University College, London. Illustrated
by upwards of 400 Engravings on Wood. 3 vols., small 8vo, 14. 11s. 6d.

ELLIS'S DEMONSTRATIONS OF ANA-
TOMY. A Guide to the Knowledge of the Human Body by Dissection.
Fourth Edition. Small 8vo, 12s. 6d.

KIRKES'S HANDBOOK OF PHYSIOLOGY.
Illustrations on Steel and Wood. Third Edition. Small 8vo, 12s. 6d.

DR. LARDNER'S ANIMAL PHYSICS; or,
THE BODY AND ITS FUNCTIONS FAMILIARLY EXPLAINED.
Illustrated by 520 Engravings. 1 vol., small 8vo, 12s. 6d. cloth.

GREGORY'S HANDBOOK OF CHEMIS-
TRY. Fourth Edition. Complete in 1 vol., small 8vo, 18s.

*** Sold also in 2 vols. (*separately*):

INORGANIC CHEMISTRY, 6s. 6d. ORGANIC CHEMISTRY, 12s.

BUNSEN'S GASOMETRY; comprising the
Leading Physical and Chemical Properties of Gases, together with the
Methods of Gas Analysis. By ROBERT BUNSEN, Professor of Chem-
istry in the University of Heidelberg. Translated by HENRY E.
ROSCOE, B.A., Ph.D. With 59 Illustrations. 8vo, 8s. 6d. cloth.

QUAIN AND WILSON'S ANATOMICAL
PLATES. 201 Lithographic Plates, with Descriptions.

Bones and Ligaments	30 Plates	0 17 0	1 0 0

MR. QUAIN ON DISEASES OF THE
RECTUM. With Illustrations. Second Edition. 1 vol., small 8vo, 7s. 6d.

MORTON'S SURGICAL ANATOMY OF
THE PRINCIPAL REGIONS. 25 Lithographic Plates, coloured;
and 25 Woodcuts. Royal 8vo, 14. 1s. cloth.

DR. BALLARD'S PHYSICAL DIAGNOSIS
OF DISEASES OF THE ABDOMEN. 1 vol. small 8vo, 7s. 6d.

DR. BALLARD ON PAIN AFTER FOOD
ITS CAUSES AND TREATMENT. 1 vol. small 8vo, 4s. 6d.

DR. GARROD'S ESSENTIALS OF MATE-
RIA MEDICA, THERAPEUTICS, AND THE PHARMACOPŒIAS.
Fcap. 8vo, 6s. 6d.

MOHR AND REDWOOD'S PRACTICAL
PHARMACY. 400 Woodcuts. 8vo.

LIEBIG'S HANDBOOK OF ORGANIC
ANALYSIS. By DR. HOFMANN. 85 Illustrations. Small 8vo,
5s.

WOHLER'S HANDBOOK OF INORGANIC
ANALYSIS. By DR. HOFMANN. Small 8vo.

LIEBIG'S LETTERS ON MODERN AGRI-
CULTURE. Small 8vo. 6s.

LIEBIG'S FAMILIAR LETTERS ON
CHEMISTRY. Fourth Edition, revised and enlarged. Small 8vo,
7s. 6d.

LIEBIG'S PRINCIPLES OF AGRICUL-
TURAL CHEMISTRY, WITH SPECIAL REFERENCE TO THE
LATE RESEARCHES MADE IN ENGLAND. Small 8vo. 3s. 6d.,
cloth.

LIEBIG'S AGRICULTURAL CHEMIS-
TRY. Fourth Edition, revised. 8vo, 6s. 6d. cloth.

LIEBIG'S ANIMAL CHEMISTRY; or,
CHEMISTRY IN ITS APPLICATIONS TO PHYSIOLOGY AND
PATHOLOGY. Third Edition. 8vo. Part I. (the first half of the
work) 6s. 6d. cloth.

LARDNER'S HANDBOOK OF NATURAL
PHILOSOPHY, with 1334 Illustrations. Complete in 4 vols. 12mo.
20s.

*** Each volume is complete in itself, and is sold separately as under:—

MECHANICS.....	One Volume.	5s.
HYDROSTATICS, PNEUMATICS, and HEAT.....	One Volume.	5s.
OPTICS.....	One Volume.	5s.
ELECTRICITY, MAGNETISM, and ACOUSTICS....	One Volume.	5s.

MEDICAL AND SURGICAL WORKS

PUBLISHED BY

ADAM AND CHARLES BLACK.

By JOHN HUGHES BENNETT, M.D.

Professor of the Institutes of Medicine and Senior Professor of Clinical Medicine in the University of Edinburgh.
A Third Edition of

Clinical Lectures on the Principles and PRACTICE of MEDICINE. Svo. Pp. 1000, with five hundred illustrations on wood. Price 30s.

By the SAME AUTHOR,
A Third Edition of

An Introduction to Clinical Medicine:
Six Lectures on the Method of Examining Patients, and the means necessary for arriving at an exact Diagnosis. 12mo. Price 5s.

By the SAME AUTHOR,
In 12mo, profusely illustrated, price 6s.

Outlines of Physiology.

By JAMES Y. SIMPSON, M.D.
Professor of Midwifery in the University of Edinburgh.

Obstetric Memoirs and Contributions;
including those on Anæsthesia. Edited by Drs. PRIESTLEY and STORER. Illustrated. 2 vols. Svo. Price £1 16s.

By JAMES MILLER, F.R.S.E.
Professor of Surgery in the University of Edinburgh.

The Principles of Surgery. Third Edition. Illustrated. Demy Svo. Price 16s.

By the SAME AUTHOR,

The Practice of Surgery. Third Edition. Illustrated. Demy Svo. Price 16s.

By JOHN HUTTON BALFOUR, M.D.
Professor of Medicine and Botany in the University of Edinburgh.

Class-Book of Botany. Being an Introduction to the Study of the Vegetable Kingdom. Svo. Price £1 11s. 6d. Profusely Illustrated.

By JAMES D. FORBES, D.C.L. F.R.S.
Professor of Natural Philosophy in the University of Edinburgh.

A Review of the Progress of MATHEMATICAL and PHYSICAL SCIENCE in more Recent times, and particularly between the Years 1775 and 1850; being one of the Dissertations prefixed to the Eighth Edition of the Encyclopedia Britannica. 4to. Price 8s. 6d.

By ROBERT CHRISTISON, M.D.
Professor of Materia Medica in the University of Edinburgh.

A Treatise on Poisons in Relation to Medical Jurisprudence, Physiology, and the Practice of Physic. Fourth Edition. Demy Svo. Price 10s.

By THOMAS LAYCOCK, M.D.
Professor of the Practice of Physic in the University of Edinburgh.

Lectures on the Principles and Methods of MEDICAL OBSERVATION and RESEARCH. Crown Svo. Price 6s.

By T. S. TRAILL, M.D.
Professor of Medical Jurisprudence in the University of Edinburgh.

Medical Jurisprudence. Third Edition. 12mo. Price 5s.
Edinburgh: A. and C. Black. London: Longman and Co.

The Second Edition, price 3s. 6d. cloth,

The Ophthalmoscope: a Treatise on its Value in the Exploration of INTERNAL EYE DISEASES. By JABEZ HOGG, Assistant-Surgeon to the Royal Westminster Ophthalmic Hospital, &c., &c.

"The subject is elucidated by a great variety of Facts, and the little volume itself, which is a useful manual, may be consulted with advantage by those interested in the study of the eye."—Med.-Chir. Review.

"A small, practical, and complete work on the Ophthalmoscope was much wanted, and Mr. Hogg, in this volume, has supplied a generally expressed and increasing demand. We have no doubt, and much hope, this work will take its place amongst our best standard monographs and manuals."—Dublin Medical Press.

"Will undoubtedly repay perusal by those who take an interest in ophthalmic medicine and surgery."—Dublin Quar. Journ. Med.

"It ought to be in the hands of every surgeon."—Medical Circular.

"This little volume will doubtless find a ready sale from its practical utility, which claims for it a place amongst the standard works of the day on ophthalmic medicine."—The Lancet.

John Churchill, New Burlington-street.

STUDENTS' CLASS-BOOKS.

I.
Second Edition, Svo, 884 pages, 400 Woodcuts, price £1 11s. 6d.

A General Outline of the Organisation of the ANIMAL KINGDOM, and Manual of Comparative Anatomy. By THOMAS RYMER JONES, F.R.S. Professor of Comparative Anatomy in King's College, London, late Fullerian Professor of Physiology to the Royal Institution of Great Britain, &c.

II.
Handbook of Chemical Manipulation, with very numerous Illustrations. By C. GREVILLE WILLIAMS, Principal Assistant in the Laboratory of the University of Edinburgh. Post 8vo, 15s.

III.
Uniform with the above,
A Manual of Chemical Analysis (Qualitative). By A. B. NORTHCOTE, F.C.S. and ARTHUR H. CHURCH, F.C.S. Post 8vo. In October.

IV.
Elementary Course of Botany, Structural, Physiological, and Systematic, with a brief Outline of the Geographical and Geological Distribution of Plants. By ARTHUR HENFREY, F.R.S. L.S. &c. Professor of Botany in King's College, London, Examiner in Natural Science to the Royal Military Academy and to the Society of Arts. Uniform with the above, and illustrated by upwards of 500 Woodcuts, price 12s. 6d.

V.
Manual of British Botany. By C. C. BABINGTON, M.A. &c. Fourth Edition, 10s. 6d.

VI.
Elementary Course of Geology, MINERALOGY, and PHYSICAL GEOGRAPHY. By Professor DAVID T. ANSTED, M.A. F.R.S. F.G.S. &c. Consulting Mining Engineer, Honorary Fellow of King's College, London, Lecturer on Mineralogy and Geology at the H.E.I.C. Military Seminary at Addiscombe, late Fellow of Jesus College, Cambridge. A Second Edition, post 8vo, with many Illustrations, 12s.

John Van Voorst, 1, Paternoster-row.

Just published, Svo. Price 7s. 6d.

A Treatise on Medical Electricity, Theoretical and Practical. By J. ALTHAUS, M.D.

"There existed a hiatus in British Medical literature, on the subject which the present work most worthily fills up. Dr. Althaus' treatise is complete, accurate, and scientific. The Book is written in clear and even elegant style."—British and Foreign Medico-Chirurgical Review.

"In the work before us Dr. Althaus gives abundant evidence of his qualifications to investigate the therapeutic influence of electricity, by a judicious and carefully-devised system of experimentations. Of its general tone and spirit we can speak most favourably."—Westminster Review.

Dr. Althaus has supplied to the English Profession by far the most elaborate and useful book on the subject upon which it treats extant in our mother tongue. The book will command general reference. We expect to see it for some time to come, the standard English work on Medical Electricity."—Medical Times and Gazette.

"A very complete and able work, exhibiting the state of the science in its most advanced stages, and giving a clear account both of its general and Medical history. Dr. Althaus shows a perfect knowledge of every department of his subject, and we can recommend his book with pleasure."—Medical Circular.

London: Trübner and Co., 69, Paternoster-row.

Now ready, price 5s. 6d., or free by post to any part of the United Kingdom, price 6s., Fourth Edition, greatly enlarged and improved,

A Grammatical Introduction to the LONDON PHARMACOPOEIA, and a KEY to PHYSICIANS' PRESCRIPTIONS. By F. S. LEACH.

"This little work will be found extremely useful to students who have received but an imperfect classical education."—The Lancet.

Hughes and Butler, Medical Booksellers and Publishers, 15, St. Martin's-le-Grand.

STANDARD MEDICAL CLASS BOOKS.

Neligan's Atlas of Coloured Drawings
of CUTANEOUS ERUPTIONS. Sixteen plates, small folio, containing nearly One Hundred Delineations. Price 25s.

Neligan on Diseases of the Skin.
One vol. post 8vo. cloth lettered, price 9s. 6d.
"This work will be found a valuable addition to the library of the practitioner."—*Medical Times and Gazette*.

Neligan's Medicines, their Uses and MODE OF ADMINISTRATION. Fifth Edition, One vol. 8vo. cloth, price 15s.

Besides numerous and important additions, the entire work has been thoroughly revised, and all the formulæ contained in the British Pharmacopœias, are now for the first time, given at length.

Churchill's Manual for Midwives and NURSES. Fcap. cloth, price 4s.

"Very full and explicit directions are given respecting all those minor offices and services which a monthly nurse has to discharge. Some useful receipts for making foods and drinks for invalids are also introduced, and very excellent maxims given for regulating the conduct and conversation of the nurse in the sick-room!"—*Dublin Medical Journal*.

Will be ready in November,

Power's Surgical Anatomy of the ARTERIES. Fcap. 8vo. with numerous illustrations from Drawings by B. W. RICHARDSON, F.R.C.S.I.

"A really standard book, and we are glad to see this edition carefully edited and enlarged, as it is by Dr. Power. The work is concise, clear, and simple."—*Lancet*.

Corrigan on the Nature and Treatment of FEVER; with Clinical Illustrations. Post 8vo, cloth, 4s. 6d.

"In our review of this volume we have attempted rather to indicate its contents than to criticise the matter or manner thereof, for the views of a Physician of the sound judgment and great practical experience of Dr. Corrigan are much above the comment of the critic, as they need not the support of his pen to enhance their value. Yet we must be permitted to express the gratification we feel at the publication of another of those valuable practical works for which the Irish School of Medicine has become so celebrated, and to tell our readers that, in Dr. Corrigan's Lectures on Fever, they will find a collection of aphorisms, a knowledge of which will relieve them from many a difficulty at the bedside of their patient."—*Dublin Journal of Medical Science*.

Churchill on Diseases of Women,
INCLUDING THOSE OF PREGNANCY and CHILDBED. Fourth Edition, fols. 8vo. cloth, price 12s. 6d.

"A work like the present has long been a desideratum in our Medical literature, both for Practitioners and for the student."—*British and Foreign Medical Review*.

"It has the testimony of our unqualified approbation. It surpasses any other that has ever issued on the same subject from the British press."—*Dublin Medical Journal*.

"We can conscientiously recommend Dr. Churchill as a safe and useful guide."—*London Medical Gazette*.

Ledwich's Practical and Descriptive ANATOMY. One Vol. post 8vo, cloth price 12s. 6d.

"It is evidently written directly from observations made in the dissecting room, and is, therefore, peculiarly adapted as a handbook for the student who seeks his information in the only way in which it can be correctly obtained—from the dead body itself."—*Dublin Quarterly Journal of Medical Science*.

"The author's task has been performed ably, clearly, and systematically. The work will be found useful to the dissector, be he an old or a young student."—*Lancet*.

Orr's Principles of Surgery.
One Vol. fcap. 8vo, cloth lettered, price 10s. 6d.

"We are confident of the success of Mr. Orr's Principles of Surgery."—*Lancet*.

"The highest praise we can bestow on the work is to say—it is the record of the opinions of an able surgeon."—*Medical Times*.

"It cannot fail of proving an acceptable boon to both the student and the Practitioner."—*Dublin Medical Press*.

Lees on Diseases of the Stomach and INDIGESTION. Fcap. 8vo. cloth, price 4s.

"The rules of treatment are given with clearness and conciseness, and may be considered as trustworthy guides for the practitioner."—*Medical Times and Gazette*.

Churchill on Diseases of Children.
Second edition. Fcap. 8vo. price 12s. 6d.

"It is indispensable to the general practitioner."—*Medical Circular*.

"As the work now stands, it is, we believe, the most comprehensive treatise in the English language upon the diseases incident to early life."—*Dublin Quarterly Journal*.

STANDARD MEDICAL CLASS BOOKS—*Continued.*

Bellingham on Diseases of the Heart.

One vol. 8vo. cloth, price 12s. 6d.

"This is an excellent and systematic work by an author whose position and experience entitle his opinions to be received with attention. We can heartily recommend the study of this work to all interested in cardiac pathology. It is comprehensive and practical, well arranged and clearly written."—*American Journal of the Medical Sciences*.

"We can confidently recommend the volume now under review as a safe and trustworthy guide for the student and practitioner."—*Association Medical Journal*.

"It is an excellent and well-written summary of what is known on the important subject of which it treats."—*Edinburgh Monthly Journal*.

The Dublin Dissector, or System of

PRACTICAL ANATOMY, comprising a concise Description of the Bones, Muscles, Vessels, Nerves, and Viscera, also the Relative Anatomy of the different Regions of the Body; for the use of Students in the Dissecting-Room. By ROBERT HARRISON, M.D., V.P.R.C.S.I., M.R.I.A., illustrated by 160 Engravings on Wood. Fifth Edition, 2 vols., fcap. 8vo, price 12s. 6d.

"A work highly and justly esteemed for its amount of information and clearness of arrangement and language. In its present enlarged and improved state it will supply every instruction that the Student can require, and it will be the very best companion he can take to the Dissecting-room."—*William Lawrence, Esq., President of the Royal College of Surgeons, London*.

"I have always considered the work the best of its kind; and in this new edition its superiority is, I find, much increased."—*S. Wharton Jones, Esq., F.R.S.*

"An elegant and valuable work,—the companion equally of the Lecture Theatre and Dissecting Room."—*Medical Gazette*.

"Far above all other competitors in its own peculiar department." "It has no rival in any language."—*Dublin Journal of Medical Science*.

Wilmot on Stricture of the Urethra,

Including an Account of Perineal Abscess, Urinary Fistula, and Infiltration of Urine.

"The Practical Surgeon will find this book after his own heart. In every page the reader is impressed with a sense that he is listening to one who utters nothing but what he is practically familiar with; and has carefully reflected upon."—*Dublin Medical Journal*.

London: Longman and Co. Dublin: Fanning and Co. Edinburgh: MacLachlan and Stewart.

DR. SAMUEL WILKS'S LECTURES ON ANATOMY.

Just published, in 8vo, pp. 480, price 10s. 6d. cloth,

Lectures on Pathological Anatomy,

with accompanying Tables, being a systematic treatise on the subject, and a complete Manual for Students. By SAMUEL WILKS, M.D. Lond., Fellow of the Royal College of Physicians, Assistant-Physician to Guy's Hospital, Lecturer on Pathology, and Curator of the Museum.

"DR. WILKS has undertaken a task which we will venture to say that few men in this country are capable of performing as well as he. A book of this kind done in this form and fashion was most needed in our language; and one especial excellence we should notice in connexion with it, that the author is not a mere pathological anatomist, but a physician; he does not merely describe the diseased process, but he argues of it as a man whose business it is to treat diseases. His large experience enables him to offer many new suggestions, and to point out some new facts in reference to pathology, and to clear up some of the disputed questions affecting it."—*Medical Times and Gazette*.

London: Longman, Green, Longman, and Roberts.

Just published, in 12mo. price 3s. 6d. cloth,

The Climate of Brighton. By William

KEBBELL, M.D., Physician to the Sussex County Hospital; Author of "Lectures on the Diseases of Towns."

London: Longman, Green, Longman, and Roberts.

NEW WORKS BY LIONEL BEALE, M.B. F.R.S.

Just published, 8vo, 390 pp. 14s.

The Microscope in its Application

TO PRACTICAL MEDICINE. 270 Woodcuts and a coloured plate. 5s.
HOW TO WORK WITH THE MICROSCOPE. A Guide to the Practical Use of the Instrument, with Directions for Examining and Preserving Specimens, Injecting, &c.

ILLUSTRATIONS to the above, upwards of 150 figures. 2s. [Nearly ready.]

LECTURES ON URINE, URINARY DEPOSITS, and CALCULI. [Preparing.]

8vo, 9s. 6d.

ILLUSTRATIONS OF URINE, URINARY DEPOSITS, and CALCULI. 35 Plates, containing upwards of 170 separate figures carefully copied from the objects. This work is intended specially for the assistance of the Student and Medical Practitioner in the examination of Urine.

TABLES for the EXAMINATION of URINE, URINARY DEPOSITS, and CALCULI. 2s. 6d.

John Churchill, New Burlington-street.

8vo, price 8s.

The Diagnosis of Diseases of the Brain,

SPINAL CORD, NERVES, and their APPENDAGES. By J. RUSSELL REYNOLDS, M.D.

Also, by the same Author, 4to, price 1s. 6d.

TABLES FOR THE DIAGNOSIS OF DISEASES OF THE BRAIN.

John Churchill, New Burlington-street.

Nearly ready, in demy 8vo, illustrated, a Second Edition of
The Pathology and Treatment of Pulmonary Consumption. By J. HUGHES BENNETT, M.D., Professor of the Institutes of Medicine in the University of Edinburgh, &c. &c.
 Edinburgh: Adam and Charles Black.

BOOKS FOR STUDENTS.

LECTURES ON THE PRINCIPLES AND PRACTICE OF PHYSIC.

By THOMAS WATSON, M.D.,
 Physician Extraordinary to the Queen.
 Fourth Edition, revised. Two Volumes, Octavo, 34s.

ANATOMY, DESCRIPTIVE AND SURGICAL.

By HENRY GRAY, F.R.S.

Lecturer on Anatomy at St. George's Hospital.
 With 363 Large Woodcuts, from Original Drawings, with Dissections made by the Author and Dr. Carter. Royal Octavo, 782 pages. 28s.

PHYSIOLOGICAL ANATOMY AND PHYSIOLOGY OF MAN.

By ROBERT BENTLEY TODD, M.D., F.R.S.,

AND

WILLIAM BOWMAN, F.R.S., of King's College.
 With numerous Original Illustrations. Two Volumes. £2.

ELEMENTS OF CHEMISTRY.

By WILLIAM ALLEN MILLER, M.D., F.R.S.,
 Professor of Chemistry, King's College, London.
 Complete in Three Parts, with numerous Illustrations, £2 6s. 6d.

London: JOHN W. PARKER and SON, West Strand.

Fcap. cloth, price 12s. 6d. post free,

A Manual of Human Anatomy,

Descriptive, General, and Practical. By ROBERT KNOX, M.D.
 Illustrated by 250 highly-finished Wood Engravings, the vessels coloured.
 London: Henry Renshaw, 356, Strand.

Fcap. cloth, price 12s. 6d.

Dr. Churchill's Theory and Practice

OF MIDWIFERY. The Third Edition, Corrected, Improved, and considerably Enlarged, with extensive Statistics, and illustrated by 119 Wood Engravings.

London: Henry Renshaw, 356, Strand. Dublin: Fannin and Co.

In Royal 32mo, cloth, price 5s.

Ward's Outlines of Human Osteology,

a Compendious Treatise on the Anatomy and Mechanism of the Skeleton, designed by a new method of arrangement to facilitate the progress of the Student. By F. O. WARD.

London: Henry Renshaw, 356, Strand.

On the Constitutional Treatment of

FEMALE DISEASES. By EDWARD RIGBY, M.D., etc.

"We know of no other obstetric writer who so strongly insists on the intimate connexion between uterine and constitutional disorders, or who has carried out this principle so consistently and so successfully. On this account we look upon the work as peculiarly valuable, and calculated to do an immensity of good at the present time, by dispelling the one-sided and narrow views so generally prevalent respecting this class of diseases, and placing their pathology and treatment on a sounder and more rational basis."—Dublin Quarterly Journal of Medical Science.

London: Renshaw, 356, Strand

Just published, new and improved Edition, price 1s.

The Curability of Consumption. Being

a Series of Papers, presenting the most prominent and important Practical Points in the Treatment of the Disease. By F. H. RAMADGE, M.D. Fellow of the Royal College of Physicians, and late Senior Physician to the Royal Infirmary for Diseases of the Chest, &c.

"Dr. Ramadage's treatment is so simple, that I not only feel a high predilection for it, but think it worthy to be recommended to the impartial and careful examination of my Professional brethren."—Hohbaum.
 "Experience convinces us that Dr. Ramadage's work is full of interest, and merits the special attention of practitioners."—Lebeau.
 "Pathological anatomy has, perhaps, never afforded more conclusive evidence in proof of the curability of a disease, than it has in that of tuberculous phthisis."—Carswell.

Also by the same Author, price 10s. 6d.
A TREATISE ON ASTHMA AND DISEASES OF THE HEART.

London: Longman and Co.

SERVICEABLE BOOKS FOR MEDICAL STUDENTS.

I. Professor Syme's Principles of Surgery.

Practical Observations on the Treatment

of STRICTURE of the URETHRA, and FISTULA in PERINEO. Third Edition, illustrated with additional Cases and new Drawings of all the Affections; with a copious Appendix, containing the Opinions of the most eminent London Surgeons and others, on the Perineal Section, showing that the operation has proved either delusive or fatal, in London, Manchester, and Edinburgh. By JOHN LIZARS, F.R.S.E., the Professor of Surgery to the Royal College of Surgeons, and lately Senior Operating Surgeon to the Royal Infirmary, Edinburgh.

"Much information regarding Perineal Section will be found in the treatises on Urethral Stricture, by Professor Lizars and Mr. H. Smith."—Extract from an instructive practical paper by Mr. Wade, read before the Medical Society of London, and inserted in the Lancet of 14th May, 1859.

"Posterity will have to thank him for arresting in its bud a practice painful of execution, of uncertain result, irreparable when once performed, and fraught with peril to the patient. We say to all who profess themselves Surgeons, Read the report of cases operated upon by Mr. Syme, published in an Appendix to the work here reviewed."—Extract from Medical Times and Gazette of 7th January, 1854.

Edinburgh: MacLachan and Stewart.

London: Simpkin, Marshall and Co.

Pillischer's Achromatic Microscopes.—

To meet the daily increasing demand for his Microscopes, M. PILLISCHER has recently completed extensive alterations in his workshops to enable him to manufacture MICROSCOPES and their Object Glasses upon a more expeditious and extensive scale. M. P. has the pleasure of informing the Profession that he is now able to furnish Microscopes of the very greatest perfection; possessing every modern improvement; and with Object Glasses of a quality unsurpassed by any other maker, on the shortest notice, and at very moderate prices.

PILLISCHER'S £7 7s. STUDENT'S MICROSCOPE, for which a prize Medal was awarded to him at Paris Exhibition, 1855, deserves particular notice. It consists of a well-constructed Stand, with coarse and fine adjustments, a capital Stage, with Diaphragm and Large Mirror, one Eye-glass, one and one quarter inch Object Glasses, 16" and 75" angular aperture, and a neat Mahogany Case about 7 in. square. The above Microscope when further completed with the addition of a Second Eye-glass, Condenser for Opaque Objects, Live Box, Stage Forceps, large Glass Stage, and Polarising Apparatus, price £10, forms a most complete and valuable Microscope, and in every respect as useful as a much more expensive one.

A Catalogue post free on application to M. Pillischer, Optician, 88, New Bond-street, London, W.

Health, Fresh Air, and Pure Water.

—By Her Majesty's Letters Patent.—CONDY'S FLUID contains NASCENT OXYGEN, *nature's true and only purifying agent*; instantly removes all offensive smells; renders impure water fresh, and the air pure; when diluted for use, is of a beautiful colour, not soiling the finest linen; is harmless, and particularly adapted for toilet use, being both refreshing and exhilarating. The Medical Profession have expressed their unqualified approbation of its merits. One gallon makes 200 gallons adapted for use. The cooling, healing, gently stimulating and invigorating properties of this Fluid render it, when diluted, a lotion possessing peculiar and valuable characteristics, whether for bathing the bodies of invalids, incorporating in poultices, or washing and healing wounds. Patronised by the Board of Health, and most public departments, hospitals, schools, and adopted by the India Council in preference to all other disinfectants. In bottles, 6d. 1s. and 2s.; stronger and purer, 1s. 2s. and 4s.

CONDY'S PATENT HEALTH POWDER also contains NASCENT OXYGEN, is odourless, and destroys all smells; in bottles, 1s. 6d. and 3s., and in casks of 1 cwt. 30s.—Wholesale agents, John Bell and Co. chemists, No. 338, Oxford-st. W.; Butler and Crisp, 5, Cheapside, St. Paul's; Ferris and Co., Bristol.—Chemical Works, Battersea, S.W.

[ESTABLISHED 1841.]

Medical, Invalid, and General Life

OFFICE, 25, Pall-mall, London.—Empowered by special Act of Parliament

At the SEVENTEENTH ANNUAL MEETING, held on the 25th November, 1858, it was shown that on the 30th June last.—

The number of Policies in force was	6083
The Amount Insured was	£2,551,136 6s. 6d.
The Annual Income was nearly	£120,000

The new Policies issued during the last Five years are as follows:—
5411 Policies for £2,599,658, yielding £110,624, in Premiums, showing an average yearly amount of new business of more than

HALF A MILLION STERLING.

The Society has paid claims on 1002 Policies, assuring £126,044, since its establishment in 1841.

Assurances are effected at home or abroad on healthy lives at as moderate rates as the most recent data will allow.

INDIA.—Officers in the Army and civilians proceeding to India, may insure their lives on the most favourable terms, and every possible facility is afforded for the transaction of business in India.

INVALID LIVES assured on scientifically constructed tables based on extensive data, and a reduction in the premium is made when the causes for an increased rate of premium have ceased.

MEDICAL MEN are consulted in every case, and are paid a Guinea for each Report, and receive the same advantages as Solicitors for any business they may introduce.

Policies issued free of stamp-duty, and every charge but the premiums. In the event of death during the days of grace, the risk binding on the Society if premium paid before the days of grace expire.

Every information may be obtained at the chief office, or on application to any of the Society's agents. C. DOUGLAS SINGER, Secretary.

Students' Achromatic Microscopes.—

C. BAKER, 243 and 244, HIGH HOLBORN, begs to inform the Profession that having introduced improved machinery, he is now enabled to supply a superior ACHROMATIC MICROSCOPE suitable for all Physiological Investigation at the very low price of £3 3s.: they have quick and slow motion, a 1-inch, 3-inch, and 4-inch object glasses, together with all the necessary apparatus packed in a neat mahogany case complete.

Students and others requiring a really practical instrument at a moderate charge are strongly recommended these, as they answer all the purposes of the more expensive kind.

Catalogues by post free upon application.

Struve's Seltzer, Marienbad, Vichy,

KISSINGEN, and other MINERAL WATERS.—Under her Majesty's especial Patronage.—ROYAL GERMAN SPA, BRIGHTON, STRUVE'S PUMP-ROOM and PROMENADES, offering every facility for a Course of Mineral Waters, as perfect and beneficial as at the natural springs, are NOW OPEN, for the Thirty-fifth Season. A prospectus, with the highest Medical testimonials, may be obtained gratis, at the Pump-room, or from George Waugh and Co. Chemists to the Queen, 177, Regent-street (west side), London, and other respectable houses in London and the provincial towns, where orders for Struve's Bottled Mineral Waters continue to be executed.

CAUTION.—The success obtained by Struve's Mineral Waters, owing to their perfect identity with those of the natural springs, has induced several parties to attempt imitations, sold as "Brighton Seltzer," "Brighton Vichy," &c., an analysis of some of which has shown an utter disregard of their true chemical composition. To distinguish Struve's Waters from all others, every bottle has a label and red ink stamp over the cork, each bearing Struve's name, without which name none is genuine, though contained in Struve's old bottles.

GLENFIELD PATENT STARCH,
USED IN THE ROYAL LAUNDRY,
AND PRONOUNCED BY HER MAJESTY'S LAUNDRESS TO BE
THE FINEST STARCH SHE EVER USED.
Sold by all Chandlers, Grocers, &c. &c.

WEISS and SON, 62, STRAND, LONDON, SURGEONS' INSTRUMENT MAKERS and MECHANICIANS; Manufacturers of TRUSSES and BANDAGES of every description. ARTIFICIAL ARMS, HANDS, and LEGS; CRUTCHES, PLAIN and IMPROVED.

DUVAL'S APPARATUS FOR MOIST AND DRY VAPOUR, SULPHUR, AND OTHER MEDICATED BATHS.

AGENTS—WEISS and SON, 62, STRAND, LONDON.

Surgical Instruments. -- Students

about commencing their studies at the ensuing Session can obtain, at BAILEY'S, 418, OXFORD-STREET, every description of Anatomical, Dissecting, Amputating, and Pocket Instruments, of the very best quality, and at a moderate price.

Student's Dissecting Case, complete	10s. and 12s. 6d.
Post-Mortem Case	£2 2 0
Pocket Cases, from	1 1 0
Case of Tooth Instruments	1 0 0

TRUSSES, ENEMAS, ELASTIC STOCKINGS, &c.

An Illustrated Catalogue will be sent free upon application.
W. H. BAILEY, 418, OXFORD-STREET, LONDON, W.

Francis L. Puckridge, Sole Inventor

and Manufacturer of the late Mr. R. Liston's WATERPROOF TRANSPARENT ISINGLASS MEMBRANE PLASTER now patronised by Mr. Liston's successor, Mr. Quain, in his hospital and private practice. Patronised likewise by Mr. W. Fergusson, Surgeon at King's College Hospital; Mr. P. M. Arnott, and Mr. Wormald, at Bartholomew's Hospital; used for amputations and other serious wounds requiring observation without exposure to air. F. L. P. begs to state there are two qualities, and it is particularly beneficial for spinal complaints, ruptures, sprains, burns, scalds, and any weakened part; also a defensive skin to apply between the wound and lint, and causes less pain in dressing; likewise a superior Waterproof Gauze Lisse and Linen, spread with the same adhesive properties as the membrane; also superior tinted Court Plasters, and Gold Beater's Skin by the yard, and in cases. F. L. P. offers his most grateful thanks for the encouragement and kind patronage he has received from the Medical gentlemen of England and foreign parts, and hopes to merit a continuance of their favours by manufacturing his Plasters with the same unremitting care as heretofore.

May be had of the Proprietor, 4, York-place, Walworth, Surgical Instrument Maker, Chemist, &c., with improved directions how to apply.

W. F. Durroch, Surgical Instrument

MAKER to the Royal Navy and Greenwich Hospital, respectfully informs the Profession that he continues to MANUFACTURE SURGICAL INSTRUMENTS of every description, of the best quality and highest finish, to which are applied all the improvements introduced by the first authorities of the day. The patronage and approval of the most eminent practitioners and lecturers warrant him in assuring gentlemen who may honour him with their commands that all his instruments will be found highly adapted for the purposes designed. Established 1748. No. 2, New-street, St. Thomas-street (near the Hospital), Southwark.

DAVIS & KIDDER'S MEDICO-MAGNETIC MACHINES.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, perious, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

Crosse and Blackwell, Purveyors in

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloater Pastes, Strasbourg and other Potted Meats, and Calf's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of

CROSSE and BLACKWELL, 21, Soho-square.

Best Iron Wire, prepared expressly by

COCKER BROTHERS, NURSERY-STREET, SHEFFIELD, for SURGICAL PURPOSES, as supplied to Professor Simpson, Edinburgh; Dr. Churchill, Dublin; Mr. T. Spencer Wells, London; Dr. Bozeman, Montgomery, U.S.; and many others.—See Professor Simpson's Lecture in Medical Times, January 1st, 1859.

Great Saving in the Purchase of New

MEDICAL GLASS BOTTLES and PHIALS at the NORTH LONDON GLASS BOTTLE WORKS, ISAACS and SON (Proprietors).—London Warehouses, 24 and 25, Francis-st., Tottenham-court-road, W. C. 6 and 8 oz., any shape, plain, or graduated } clear { 8s. per gross.
3 and 4 oz., ditto ditto } blue tinted { 7s. 6d. do.
1 oz. Moulded Phials } of a very { 4s. 6d. do.
1 oz. ditto } superior { 5s. 6d. do.
1½ oz. ditto } quality. { 6s. 0d. do.
2 oz. ditto } { 7s. 0d. do.

PURE SPIRITS FOR THE FACULTY.

S. V. R. 56 o.p., 16s. 6d. net Cash.—

This quotation admits of neither credit nor discount, and 1s. per gallon must be added for packages, to be allowed on their return.
HENRY BRETT and CO., Old Fumival's Distillery, Holborn.

The Expansible Respirator.—To this

recent and important improvement, by the original inventor of the Respirator, Mr. Jeffreys, J. E. PERCIVAL respectfully invites the attention of the Profession. Possessing a warming power equalling 40 degrees (Fahr.), it can be instantly reduced, through any of four grades, down to a power of 20° or 15°, and by practice without even removing the instrument from the face. Thus, while the air temperature may range from 30° to 50°, the wearer may enjoy one equal climate of 65° or 73°, duly tempered also by moisture. To the importance of the in-door use of the Respirator, especially at night, and in its nasal and orinatal forms attention is also particularly invited.

Chief office, 25, Bucklersbury: J. E. Percival, manager.

The instruments are procurable of the agents every where. The public are recommended to consult registered members of the profession, who will guard them against deception by defective imitations.

Great Reduction in the Prices of New

MEDICAL GLASS BOTTLES and PHIALS, at the Islington Glass Bottle Works, Islington-place, Park-road. London Warehouses, 19, Bread-street-hill, near Thames-street, City, E. C., and 2, Upper Copenhagen-street, Barnsbury-road, Islington. E. and H. HARRIS and CO. Proprietors.

15.—The Symptoms, Diagnosis, and Pathology of Phlegmasia Dolens.

16.—The Treatment of Phlegmasia Dolens (*with an engraving*).

This Volume also contains THREE LECTURES by Dr. PRIESTLEY on the

DEVELOPMENT OF THE GRAVID UTERUS,

TWO PAPERS by Dr. CONOLLY, with Illustrations of the

PHYSIOGNOMY OF THE INSANE,

LECTURES AND ADDRESSES by Sir JOHN FORBES, Professor OWEN, Mr. GREEN, and Mr. PAGET; and Communications from the following Gentlemen:—Acton, Adams, Alison, Althaus, Anstie, Armstrong, Arnott, Atcherley, Aveling, Barclay, Barlow, Barnes, Barry, Brady, Bastick, Braithwaite, Browning, Bruce, Bryce, Buchanan, Buckland, Budd, Bullar, Bulley, Bryant, Cameron, Camplin, Carson, Channing, Chapman, Cheetham, Clark, Corbitt, Cotton, Crowthorpe, Crundace, Davey, Davies, Dick, Duggan, Dunn, Dymock, Edwards, Evans, Fenwick, Field, Figg, Fleming, Fletcher, Fox, Gallagher, Gangee, Gay, Gibb, Hewson, Hillier, Hodge, Hornidge, Hoshier, Hulme, Hutchinson, Humble, Holthouse, Hunter, James, Johnson, Jones, Kealy, Keller, Kesteven, Lawrence, Lawson, Laycock, Lee, Leared, Lowes, Lethby, Lizars, Mackenzie, Marcet, Markham, De Mussy, Monckton, McCraith, McDermott, Maunders, Maysmor, Meadows, Milroy, Moore, Ogle, Parker, Pittard, Prichard, Pollock, Ramsbotham, Richardson, Robinson, Rolleston, Rooke, Rowth, Savery, Scott, Sedgwick, Shaw, Smith, Stallard, Startin, Taylor, Toynbee, Turner, Tuson, Wade, Waller, Walton, Wells, Wilde, Williamson, Wood, Wright, Young, &c.

Tarrant's Bandage and Strengthening

PLASTER.—This Plaster, from the nature of the composition and the material on which it is spread, is adapted for a permanent bandage, as it neither produces irritation of the Skin, nor, when applied, does heat cause it to lose its adaptation to the part. Having these qualities, it is peculiarly valuable in the treatment of ulcerated legs, varicose veins, etc., where equal and constant support is required. Several of the most eminent Surgeons continue to use this Plaster in their practice, preferring it, in certain cases, to any other. It is well suited for exportation to, and use in, warm climates, the high temperature having less effect on it than on any other Plaster.

The Profession are referred to Messrs. Westwoods and Hopkins, Wholesale Druggists, Newgate-street, where the Plaster may be had in packets, containing three yards, for 2s. 6d.; or, spread upon skins of Chamois leather, at 3s. 6d.

Westwoods and Hopkins also call attention to the Compound Adhesive Plaster, for fractures and wounds, as likewise to their Concentrated Preparations, Essences, etc.

W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible. Also to his MEDICINAL EXTRACTS, prepared from the fresh plants (*Hyoscyamus Niger*, *Conium Maculatum*, *Atropo*, *Belladonna*, *Cotyledon Umbilicus*, etc.) Also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alternative), Liq. Parietariae (diuretic), and Liq. Belce (prepared from the *Ægle Marmelos*, or Indian Bael), for dysentery and diarrhoea. W. T. has a large supply of INDIAN BAEL on hand. 2, Edwards-street, Portman-square. BOUDALTY'S PEPSINE imported in original bottles. *Ext. Laricis Europ*

Surgical Instruments, and every Im-

plement necessary for Surgeons and Druggists, can be had (warranted best quality and moderate prices), retail as well as wholesale, from the Manufacturer, JAMES ARNOLD, 35, WEST SMITHFIELD, St. Bartholomew's Hospital, London.

Single Circular Truss, 2s. 6d.; double ditto, 5s.; on Salmon's Expired Patent, 4s. 6d.; double ditto, 9s.; on Coles's Expired Patent, 5s.; double ditto, 10s.; Cotton Net Suspensory Trusses, from 10d.; Elastic Stocking Net bandage, 4d. per yard; Case of Tooth Instruments, £1; Case of Cupping Instruments, £2 13s. 6d.; Case of Pocket Instruments, £1; Brass Enema Syringe, complete in mahogany case, 10s. and 12s.; Case of Dissecting Instruments, Ivory Handles, 15s.; best Bleeding Lancets, per dozen, 18s.

South African Sherry, 19s. 6d. Port,

22s. Claret, 18s. Madeira, 24s. Amontillado, 26s. Cognac, 18s. 6d. Her Majesty's Wine Merchant. Specially appointed since May, 1840. Ports, from 30s.; Sherries, 30s.; Madeira, 42s.; Hocks, 40s.; Moselles, 40s.; Sparkling Hocks and Moselles, 48s.; Ditto, St. Pery, 54s.; Ditto, Burgundy, 60s.; Clarets, 28s.; Chablis, 38s.; Cote Rotie, 48s.; Champagne, 44s.; Sauterne, 40s.; Ditto, Yquem, 80s.; Essence of Turtle Punch, 56s.; Old Tom, 11s. 6d. All kinds of Foreign Spirits and Liqueurs. Particular and direct Shipments of Montilla, Vino di Pasto, Amontillado, Oloroso, Xres Viejo, Manzanilla, Longworth's Sparkling and Dry Catawba American Peach Brandy; Monongahela and Bourbon Whisky; and Sole Agent for the Celebrated Yankee Bitters. Bottled Stock for inspection, 6000 dozen. Cash or Reference. As usual, very liberal prices given for genuine Old Bottled Wines. Half-pints of first-class Champagne only.

N.B.—A considerable quantity of the Old Bottled Wines removed to Mr. M.'s Stock from Long's Hotel, North and South American Coffee House, Shugborough Park, and the celebrated Reading Sale.

TRADE  MARK.

Brown & Polson's Patent Corn Flour,

preferred to the best Arrowroot. DELICIOUS IN PUDDINGS, CUSTARDS, BLANCMANGE, CAKE, &c., and especially suited to the delicacy of CHILDREN and INVALIDS.

The Lancet states—"This is superior to anything of the kind known."

Trade Mark and Recipes, on each Packet, 4, 8, and 16 oz.

Obtain it from Family Grocers, Chemists, &c.

77A, Market-street, Manchester; and 23, Ironmonger-lane, London.

POULTICES SUPERSEDED! SPONGIO PILINE.

The Profession are respectfully

informed, that the WANDLE FELT COMPANY having purchased Mr. MARKWICK'S PATENT for the well-known SPONGIO PILINE, for the application of moist heat, in lieu of Poultices and Fomentations, and the IMPERMEABLE PILINE, for Rheumatism, for promoting perspiration, and for the application of stimulating liniments, are now supplying these articles, of superior manufacture, and at greatly reduced prices, at 27, BEDFORD-BURY, COVENT-GARDEN, London, and also through the Wholesale and Retail Druggists in town and country.

No. 1, 2, 3, is J. Alderman's

Patent Graduating Elastic Couch, shown in different positions: it is fitted with two, three, or four distinct graduating sections, by which an Invalid can be graduated to any position, without being touched by the nurse, and free from all pressure, so that a patient cannot possibly become bedsores by long confinement.

No. 4, 5, is J. A.'s improved Spinal or general Invalid Couch and Carriage. The couch can be adjusted to any position, and has a shifting stand on easy castors for the room; so that the patient can be lifted with the couch from the stand to the

16 SOHO SQUARE. J. ALDERMAN. LONDON.

carriage without being touched, so as to go out for an airing when required.

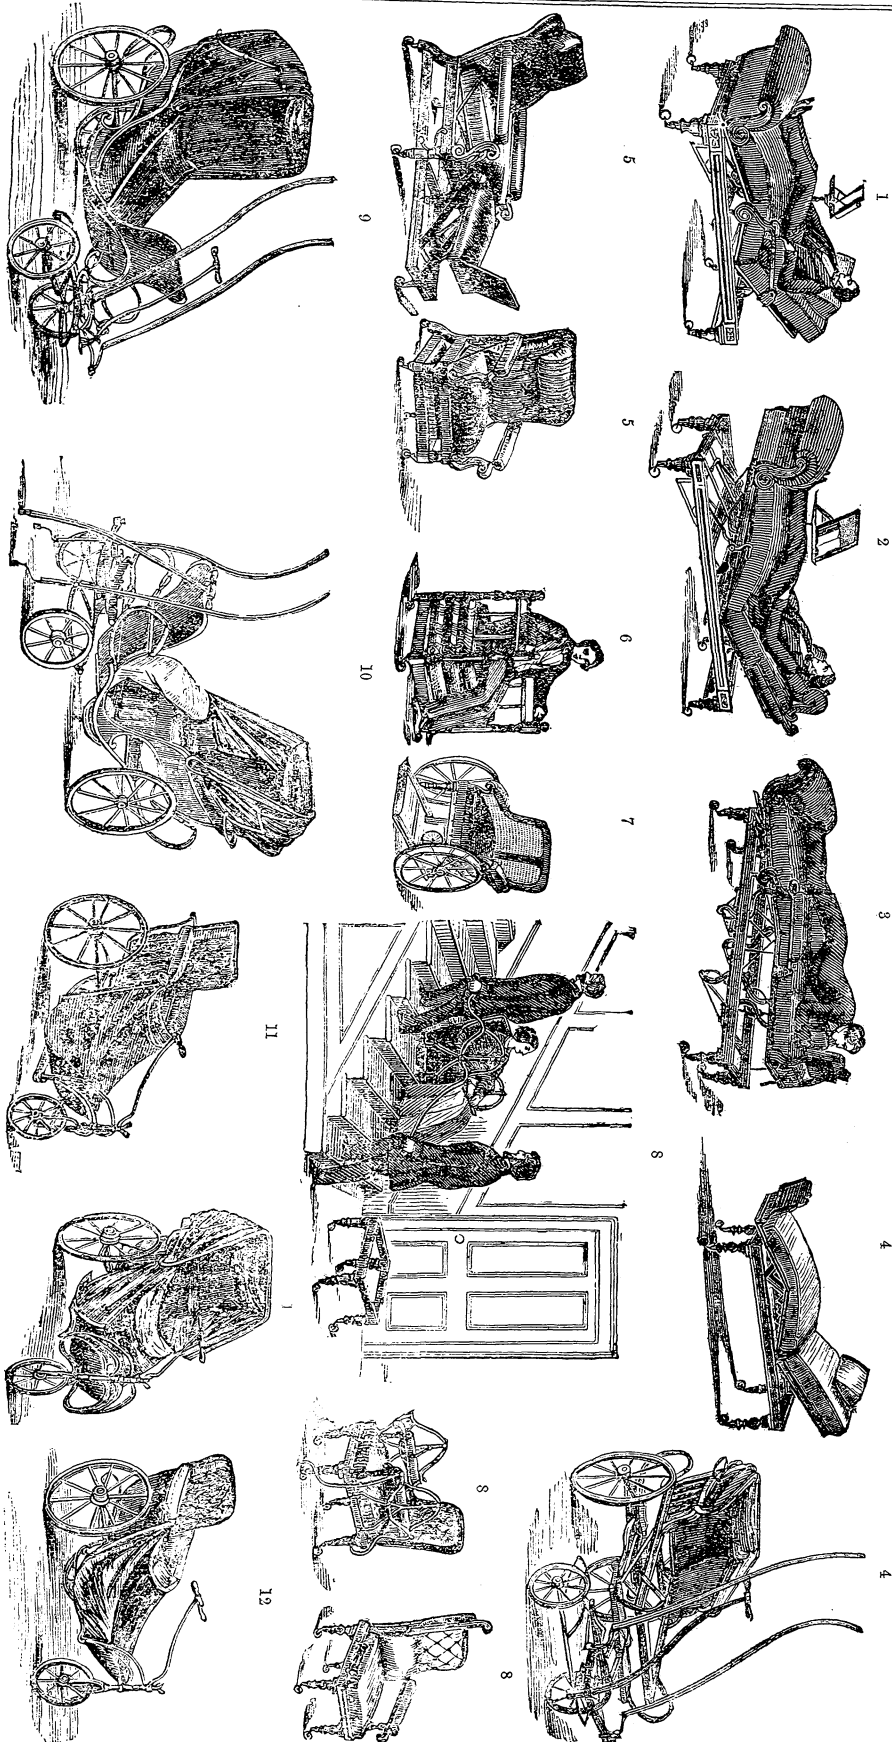

No. 5, 6, is J. A.'s Patent Graduating Elastic Self-adjusting Chair, which, like the couch, is made to follow nature in every respect—the back, the arms, the seat, and leg rest being made to work all together, so that not a muscle of the patient need be disturbed. The arms are also made to put on and off, so that the patient can get on and off from either side while the leg-rest is up.

No. 6 is J. A.'s improved Exercising Horse. No. 7 is J. A.'s improved Self-propelling Chair, which renders an Invalid perfectly independent, being able to run from room to room without any assistance.

The chair always adjusting itself, enables the two persons who carry to walk up and down stairs in the usual way, quite erect, with their arms straight down, which avoids any strains upon their muscles. It is also an easy chair for the room when the handles are off, and free from oscillation.

No. 8, 9, is J. A.'s improved Four-wheel Albert Chair, fitted for hand or pony: the body being mounted upon C and under springs behind, and elliptic springs in front, which make it a most elegant and easy carriage. No. 10 is J. A.'s improved Four-wheel Brighton Chair, mounted upon C and under springs both back and front, and has his new wrought-iron perches or cranes, instead of the old-fashioned wood perches. This is the most elegant and easy carriage in use.

No. 11, 12, is J. A.'s improved Three-wheel Albert Chair, with and without a head, and of the cheapest construction. No. 13 is J. A.'s improved Three-wheel Garden or Bath Chair, fitted with or without a head, and of the cheapest construction.

ADDITIONAL TESTIMONY ON THE EXTRAORDINARY EFFICACY OF DR. J. COLLIS BROWNE'S (M.R.C.S.L., Ex-ARMY MEDICAL STAFF) CHLORODYNE.

MEDICAL PROPERTIES—Anodyne, Diaphoretic, Sedative, Astringent, Antispasmodic, Diuretic.

A few Extracts of Medical Reports are furnished in testimony of the exceeding value of this New Remedial Agent.

The following extract from a letter by Dr. SHORTHOUSE (late of the Metropolitan Convalescent Hospital), of Carshalton, to a Medical friend in the North of England, is published by permission:—

“And now, my friend, about ‘Chlorodyne’—the infallible and incomparable Chlorodyne! The best idea I can give you of my estimate of its value will be in the fact, that I have within the last fifteen months used 160 ounces of it, and as each ounce contains about fifty adult doses, I have given at least 8000 doses. This is what I have administered myself, and is altogether independent of a large quantity which I have prescribed, and the patients have procured for themselves. It is, as I said before, a remedy quite *unique*, and its effects totally dissimilar to those of opium or any other English medicine. It requires some little management in its administration, so as to ensure its best effects. Out of the many hundreds of patients for whom I have prescribed it, I have found it disagree with but three.

“Its mode of action is that of an astringent in suppressing hemorrhage and diarrhoea; an anti-spasmodic in colic and all forms of spasmodic cough; an anodyne in allaying pain and excitement, and producing tranquillity and a most heavenly state of repose.

“The cases (among others) in which I have employed it have been twelve cases of phthisis; eight of these patients had been examined by other Medical men, and had been regarded as genuine cases of consumption, so that the nature of the disease does not rest upon my testimony alone. They were all well-marked cases; for I do not mention several others in an incipient stage. Two of the cases were in the last stage—*i. e.* cavities had formed in the lungs; two others were bordering upon this stage. The remaining eight were in the second stage—that of softening; in five of these hæmoptysis was a prominent symptom. All these cases have done, or are doing, exceedingly well. Five of them have quite recovered; the others, with one exception, are in a fair way towards recovery.

“I have used it in many cases of hooping-cough and bronchitis, especially that form of the disease attended with laryngeal complication, *i. e.* irritation of the superior laryngeal nerve, with a very harassing spasmodic cough; and in these cases I can speak of it as a remedy of the highest value.

“In dysentery and dysenteric diarrhoea, and in mucous diarrhoea with pain round the umbilicus, it is invaluable; one dose, or at most two, being sufficient. In simple diarrhoea it is hardly worth while giving it a trial. But its effects are most marked in cases of hæmorrhage, which it will arrest almost instantaneously; I have had several proofs of this. In some forms of neuralgia it also affords relief in a very short period.

“I hope I have now said enough to induce you to give it a trial. But don't be misled; it is not a cure-all, nor did I ever ‘puff it off as a universal panacea for all ailments.’ It is what is perhaps better—a valuable therapeutic agent, with which you may successfully combat disease in many of its forms, and those forms most frequent and most formidable. In addition to its astringent and anodyne properties, it also possesses remarkable chemical ones, and has a marvellous effect upon the absorbent and nutritive functions. I have seen cases of secondary sores and indolent ulcers assume quite new features, when the ordinary remedies have been combined with small doses of Chlorodyne.”

From W. VESALIUS PETTIGREW, M.D., Hon. F.R.C.S. Eng.; formerly Lecturer upon Anatomy and Physiology at St. George's School of Medicine.

“I have no hesitation in stating, after a fair trial of Chlorodyne, that I have never met with any medicine so efficacious as an anti-spasmodic and sedative. I have used it in consumption, asthma, diarrhoea, and other diseases, and am most perfectly satisfied with the results.”

From the “MEDICAL TIMES.”

“TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

“SIR,—In reply to an inquiry made by your correspondent, who subscribes himself ‘Nota Bene,’ whether any cases of benefit from ‘Chlorodyne’ have come to the knowledge of your readers, I beg to say that I have been greatly pleased at the results in a case of severe pain in the hip-joint and in the vertebrae of the neck, which came on in a man long subject to chronic rheumatism, attended with permanent enlargement of the knees, ankles, and one of the wrists. He could not tolerate Opium, Hyoscyamus, or Belladonna, and in despair almost I gave him a prescription for a mixture of Chlorodyne in water, the dose being twelve minims. He took only two doses, which acted so well that he compared his feelings to being transported to Paradise. The effects lasted for several days. Whenever his pains return, he now takes a dose at bedtime, feeling secure of an escape for some days from suffering. I have also applied it locally, with good results, but in too few cases to report much upon it. It produces a certain amount of warmth and perspiration, with a remarkably soothing state of mind, as well as arresting the pain. No headache or other unpleasant symptoms followed its administration.

“I am, &c. THOMAS A. HENDERSON, M.D., L.R.C.P.,

Physician to the Ramsgate Infirmary.

“The Vale, Ramsgate, September 23, 1857.”
Extracts from the General Board of Health, London, as to its efficacy in Cholera.

“1st Stage, or Premonitory.—In this stage the remedy acts as a charm; one dose generally sufficient.

“2nd Stage, or that of Vomiting and Purging.—In this stage the remedy possesses great power, more than any other we are acquainted with, two or three doses being sufficient.

“3rd Stage or Collapse.—In all cases restoring the pulse. So strongly are we convinced of the immense value of this remedy, that we cannot too forcibly urge the necessity of adopting it in all cases.”

From THOMAS F. HALE, Esq., Surgeon, Saundersfoot, Pembrokeshire.

“SIR,—I should be much obliged by your forwarding three bottles of Dr. J. Collis Browne's Chlorodyne, which I have found most useful in allaying pain. I have used twelve ounces of it, and in nearly every case in which I have employed it, have every reason to be satisfied with the result; and although I object, as a rule, to use any preparation of a secret nature, and of whose composition I am not fully acquainted with, still, having once tried the Chlorodyne, and found that it really did produce the effects stated, I do not think I should be justified in withholding such a preparation from my patients when I see the value of the remedy.”

From C. V. RIDOUT, Esq., Surgeon, Egham, Surrey.

“SIR,—Having extensively used Dr. J. Collis Browne's Chlorodyne, I feel it incumbent upon me to add my testimony to the numerous evidences you have already received of the undoubted efficacy of this remedy. As an astringent in severe diarrhoea, and an anti-spasmodic in colic, with cramps in the abdomen, the relief is instantaneous. As a sedative in neuralgia and tic douloureux, I can record a case where its effects were very remarkable. It occurred in January last. A gardener applied to me with pain in the head, resembling most distinctly tic douloureux as usually met with in the face; it was impossible for him to prevent his head moving from side to side with great regularity at intervals of five seconds. The

pain and agony he described to be so acute that he was afraid it would induce madness. I prescribed ten minims of Chlorodyne every half-hour. The second dose mitigated his sufferings; and after the fourth dose he slept comfortably for some hours, and awoke refreshed and comparatively free from pain. I continued the Chlorodyne in diminished doses for a few days, since which time he has had no return of the attack. In uterine affections I have found it extremely valuable; and I could, if necessary, add many more striking instances of the powerful influence Chlorodyne exerts in controlling diseases.”

From H. LEE HOGG, Esq., Surgeon, Toddington.

“SIR,—I am much pleased with the action of Dr. J. Collis Browne's Chlorodyne. One day last week I was sent for in a hurry to visit a man suffering intense agony. I concluded he was passing a renal calculus, and I was correct. I at once gave him thirty minims of Chlorodyne, which caused almost immediate cessation of pain; and ten minims every four hours. The man passed a calculus as big as a small pea; and I have heard nothing more of him. I have also employed it in a case of severe after-pains with very satisfactory results; also in cases of asthma and bronchitis with marked benefit.”

From Dr. THOMAS SANDIFORD, Passage West, Cork.

“I will thank you to send me a further supply of Chlorodyne. It is the most efficacious remedy I ever used, affording relief in violent attacks of spasm within a minute after being taken. One patient in particular, who has suffered for years with periodical attacks of spasms of a most painful nature, and unable to obtain relief from other remedies, such as opium, &c., finds nothing so prompt and efficacious as Chlorodyne.”

From W. R. DAWES, Esq., Haddenham.

“DEAR SIR,—You should have heard from me sooner respecting the effects of Dr. J. Collis Browne's Chlorodyne, but the fact is, that I have found it so universally applicable as a sedative, that there is great difficulty in making a selection of cases which most strikingly mark its beneficial action without rendering my report inconveniently prolix. I can, however, most truly say, that it is a remedy more generally efficient than any other with which I am acquainted. Its sedative and anodyne effects are not only more speedily produced, but they are also more lasting, and are not followed by exhaustion, or headache, or disturbance of the digestive functions; on the contrary, in many instances its continued use has been followed by exhilaration of spirits and improvement of appetite, especially in the various painful symptoms attending uterine irritation. In hysteria and in dysmenorrhoea, this remedy acts like a charm, as also in nervous headaches and in many cases of cough. In fevers, combined in the early stage with tartarised antimony, it is often of signal service; nor is an increase of dose usually requisite to maintain its beneficial action. In a case of phthisis, the moderate dose of ten minims, taken every night, has sufficed for many months to secure quiet rest, scarcely disturbed by cough, while the omission of it is invariably followed by a restless and coughing night. One fact strikes me as very remarkable—namely, that while the tendency of Chlorodyne to produce constipation is so slight as rarely to require an aperient, it has never failed speedily to stop diarrhoea, or to extinguish attacks of ordinary Cholera. In only two or three instances has it disagreed. The sleep which follows the composing influence of the medicine is peculiarly light and refreshing.”

From Dr. B. J. BOULTON and Co., Newcastle—Sept. 26.

“We have made pretty extensive use of Chlorodyne in our practice lately, and look upon it as an excellent, direct sedative and anti-spasmodic. It seems to allay pain and irritation in whatever organ and from whatever cause.

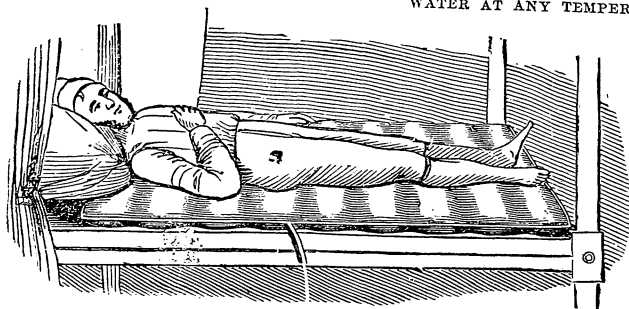

“It induces a feeling of comfort and quietude not obtainable by any other remedy, and it seems to possess this great advantage over all other sedatives, that it leaves no unpleasant after-effects.”

CAUTION.—Be sure to ask for Dr. J. COLLIS BROWNE'S CHLORODYNE; disappointment will result from any other.—See the Manuscript Signature.

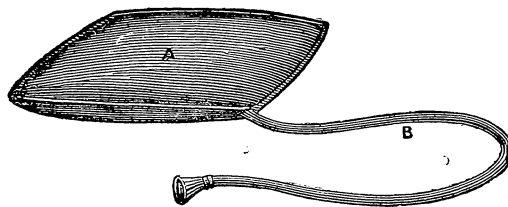

Price 3s. per ounce, and in quantity of 10 ounces carriage free.

Sole Agent and Manufacturer—J. T. DAVENPORT, Operative and Pharmaceutical Chemist, 33, GREAT RUSSELL-STREET, BLOOMSBURY-SQUARE, LONDON.

HOOPER'S HYDROSTATIC BEDS, OR MATTRESSES AND CUSHIONS, FOR PLACING ON AN ORDINARY BEDSTEAD. WATER AT ANY TEMPERATURE MAY BE USED.

HOOPER'S FULL-LENGTH MATTRESS OR HYDROSTATIC BED,
For Bedsores, Cancer, Coldness of the Body, Consumptive Cases, Diseased
Joints, Dropsy, Fevers, Fractures, Gout, Gun-shot wounds.

HOOPER'S CUSHION FOR GENERAL PURPOSES.

ANY SHAPED CUSHION CAN BE OBTAINED,
For Inflammation of the Bowels, Lassitude, Paralysis, Rheuma-
tism, Spinal Affections, Sloughing Sores, Ulcerated Cartilages,
and all Invalids.

HOOPER'S PATENT INVALID BED-LIFT.

THE OBJECT of this INVENTION is to enable the Patient to be raised in any position above the Bed, so as to allow the Medical Attendant, or Nurse,
to get at any part of the body that may be requisite; and also that the Bed may be re-made, the chamber utensil used, and removed with facility.

TO CORRESPONDENTS.

WE beg to return our best thanks to the Registrars and Secretaries of the various Universities, Colleges, Schools, etc., for their prompt replies to our Circular, and for the trouble they have taken in supplying us with the latest Regulations of the Institutions with which they are connected.

In order to confine the whole of this week's number to information specially important to Students, we are compelled to defer answers to numerous correspondents until next week.

Medical Times & Gazette.

SATURDAY, SEPTEMBER 24.

ADDRESS TO STUDENTS.

So many and such great alterations have been made since the passing of the Medical Act in the Regulations laid down by the different Examining Bodies for those who wish to obtain degrees, diplomas, or licences, and the Act itself has made such very important alterations in the positions of the different classes of the Profession, that we this year confine our usual Address to Students strictly to an explanation of those portions of the Act with which every one desirous of entering the Profession should be acquainted; referring to the full account of the regulations, which will be found in this number, of the different Universities, Colleges, and Halls, for all further information as to the precise course these bodies have lately imposed upon students.

We must premise, however, that these regulations do not affect those gentlemen who have already commenced their attendance on lectures. Some of them affect those who will begin to do so next week. As to preliminary education, it will be seen that some new Regulations of the College of Surgeons only affect those who commence their professional studies after the close of the present year; while the recommendation of the Medical Council, "That all Medical students shall pass an examination in general education before they commence their professional studies," certainly will not affect the gentlemen we are now addressing,—namely, those who are about to take their seats in the lecture-room at the beginning of the coming Winter Session; and to those only we have now to point out what they have to do in order to become legally qualified Medical Practitioners.

Now, "THE MEDICAL ACT,"—or, according to its full title, the "Act to Regulate the Qualifications of Practitioners in Medicine and Surgery,"—declares that "it is expedient that persons requiring Medical aid should be enabled to distinguish qualified from unqualified Practitioners;" and it is enacted that,—

"After the first day of July, one thousand eight hundred and fifty-nine, the word 'legally qualified Medical Practitioner,' or 'duly qualified Medical Practitioner,' or any words importing a person recognised by law as a Medical Practitioner or Member of the Medical Profession, when used in any Act

of Parliament, shall be construed to mean a person registered under this Act."

It is clear, therefore, that all Medical Students must seek to obtain the right to register under the Act. They obtain no exclusive privileges by so doing. Parliament admits no monopoly. There is no attempt to restrict the public from applying for Medical aid in sickness to Divines, Lawyers, Bone-setters, Old Women, Homœopaths, Mesmerists, American Botanists, or "Secret Friends." But it is enacted that the public shall not be deceived. It is enacted that the public may know, by the Register, who are qualified to practise Medicine, and who are not; and the following penalty is imposed upon any one who falsely pretends to be a registered person:—

"Any person who shall wilfully and falsely pretend to be or take or use the name or title of a Physician, Doctor of Medicine, Licentiate in Medicine and Surgery, Bachelor of Medicine, Surgeon, General Practitioner or Apothecary, or any name, title, addition, or description implying that he is registered under this Act, or that he is recognised by law as a Physician, or Surgeon, or Licentiate in Medicine and Surgery, or a Practitioner in Medicine, or an Apothecary, shall, upon a summary conviction for any such offence, pay a sum not exceeding twenty pounds."

A penalty is also imposed, by the following Clause, upon any one who obtains registration by false representations:—

"If any person shall wilfully procure, or attempt to procure, himself to be registered under this Act, by making or producing, or causing to be made or produced, any false or fraudulent representation or declaration, either verbally or in writing, every such person so offending, and every person aiding and assisting him therein, shall be deemed guilty of a misdemeanour in England and Ireland, and in Scotland of a crime or offence punishable by fine or imprisonment, and shall, on conviction thereof, be sentenced to be imprisoned for any term not exceeding twelve months."

On the other hand, the following Clauses confer certain privileges upon those who are truly registered:—

"Privileges of Registered Persons."

"Every person registered under this Act shall be entitled according to his qualification or qualifications to practise Medicine or Surgery, or Medicine and Surgery, as the case may be, in any part of her Majesty's dominions, and to demand and recover in any Court of Law, with full costs of suit, reasonable charges for professional aid, advice, and visits, and the cost of any medicines or other medical or surgical appliances rendered or supplied by him to his patients: Provided always that it shall be lawful for any College of Physicians to pass a bye-law to the effect that no one of their Fellows or members shall be entitled to sue in manner aforesaid in any Court of Law, and thereupon such bye-law may be pleaded in bar to any action for the purposes aforesaid commenced by any Fellow or member of such College.

"None but Registered Persons to recover Charges."

"After the first day of January, one thousand eight hundred and fifty-nine, no person shall be entitled to recover any charge in any Court of Law for any medical or surgical advice, attendance, or for the performance of any operation, or for any medicine which he shall have both prescribed and supplied, unless he shall prove upon the trial that he is registered under this Act.

"Registered Persons exempted from serving on Juries, etc."

"Every person who shall be registered under the provisions of this Act shall be exempt, if he shall so desire, from serving on all juries and inquests whatsoever, and from serving all corporate, parochial, ward, hundred, and township offices, and from serving in the militia, and the name of such person shall not be returned in any list of persons liable to serve in the militia, or in any such office as aforesaid.

"Unregistered Persons not to hold certain Appointments."

"After the first day of July, one thousand eight hundred and fifty-nine, no person shall hold any appointment as a Physician, Surgeon, or other Medical officer either in the military or naval service, or in emigrant or other vessels, or in any hospital, infirmary, dispensary, or lying-in hospital, not supported wholly by voluntary contributions, or in any lunatic asylum, gaol, penitentiary, house of correction, house of industry, parochial or union workhouse or poor-

house, parish union, or other public establishment, body, or institution, or to any friendly or other society for affording mutual relief in sickness, infirmity, or old age, or as a medical officer of health, unless he be registered under this Act: Provided always that nothing in this Act contained shall extend to repeal or alter any of the provisions of the Passengers Act, 1855.

"No Certificate to be valid unless Persons Signing be Registered."

"After the first day of January, one thousand eight hundred and fifty-nine, no certificate required by any Act now in force, or that may hereafter be passed from any Physician, Surgeon, Licentiate in Medicine and Surgery, or other Medical Practitioner, shall be valid unless the person signing the same be registered under this Act."

It will be well, also, for the Student of Medicine to be acquainted with the following Clause as to the publication of the Register annually:—

"The Registrar of the General Council shall, in every year, cause to be printed, published, and sold, under the direction of such Council, a correct Register of the names, in alphabetical order according to the surnames, with the respective residences, in the form set forth in Schedule D to this Act, or to the like effect, and Medical titles, diplomas, and qualifications conferred by any Corporation or University, or by Doctorate of the Archbishop of Canterbury, with the dates thereof, of all persons appearing on the General Register as existing on the first day of January in every year; and such Register shall be called 'the Medical Register;' and a copy of the 'Medical Register,' for the time being, purporting to be so printed and published as aforesaid, shall be evidence in all Courts and before all Justices of the Peace and others, that the persons therein specified are registered according to the provisions of this Act; and the absence of the name of any person from such copy shall be evidence, until the contrary be made to appear, that such person is not registered according to the provisions of this Act: Provided always, that in the case of any person whose name does not appear in such copy, a certified copy, under the hand of the Registrar of the General Council, or of any Branch Council, of the entry of the name of such person on the general or local Register, shall be evidence that such person is registered under the provisions of this Act."

The next question for the Student to consider is, "How am I to obtain the right to register?" The answer is simple,—1st, By the possession of a qualification; 2nd, By payment of a fee of five pounds; and 3rd, By production of evidence of qualification to the Registrar. With the second and third of these regulations we have at present nothing to do; the question of qualification is the all-important one for the Student. And the Act says, that "every person hereafter becoming possessed of any one or more" of the following qualifications shall be entitled to be registered:—

"1. Fellow, Licentiate, or Extra Licentiate of the Royal College of Physicians of London.

"2. Fellow or Licentiate of the Royal College of Physicians of Edinburgh.

"3. Fellow or Licentiate of the King's and Queen's College of Physicians of Ireland.

"4. Fellow or Member or Licentiate in Midwifery of the Royal College of Surgeons of England.

"5. Fellow or Licentiate of the Royal College of Surgeons of Edinburgh.

"6. Fellow or Licentiate of the Faculty of Physicians and Surgeons of Glasgow.

"7. Fellow or Licentiate of the Royal College of Surgeons in Ireland.

"8. Licentiate of the Society of Apothecaries, London.

"9. Licentiate of the Apothecaries' Hall, Dublin.

"10. Doctor, or Bachelor, or Licentiate of Medicine, or Master in Surgery of any University of the United Kingdom; or Doctor of Medicine by Doctorate granted prior to passing of this Act by the Archbishop of Canterbury.

"11. Doctor of Medicine of any Foreign or Colonial University or College, practising as a Physician in the United Kingdom before the first day of October, 1858, who shall produce certificates to the satisfaction of the Council of his having taken his Degree of Doctor of Medicine after regular examination, or who shall satisfy the Council under section

forty-five of this Act, that there is sufficient reason for admitting him to be registered."

In the following pages the Student will find full details of all he must do in order to obtain any one or more of the above qualifications. Probably the great majority of Students have decided, or it has been decided for them, which "one or more" they "go in for." But there are other Students, and there are many parents and tutors of Students, who are still undecided, entertaining great doubt as to the precise meaning of the 31st Clause of the Act—that quoted above as to the Privileges of Registered Persons. The Clause says, "Every person registered under this Act shall be entitled, according to his qualification or qualifications, to practise Medicine or Surgery, or Medicine AND Surgery, as the case may be, in any part of her Majesty's dominions." Now, as we said last year, "there is no difficulty here to the Physician, who only practises Medicine, or to the Surgeon who only practises Surgery, or to the Apothecary who partly by law and partly by usage, has acquired the right of charging both for the medicines he supplies and for attendance in Medical cases. But there is a great difficulty to the Physician or Apothecary who wishes to practise Surgery without a Surgical qualification; and an equal difficulty to the Surgeon who wishes to practise Medicine without a Medical qualification." This difficulty is met in various ways—

1. It is contended that the Physician is entitled to practise Surgery. A learned Professor writes to us as follows—

"By an Act passed in the year 1540 (32 Henry VIII., c. 40), intitled 'For Physicians and their Privilege,' after exempting 'the President of the Corporation of the Commonalty and Fellowship of the Science and Faculty of Physic in the City of London, and the Commons and Fellows of the same' from liability to serve certain civic and other offices, and enacting that the said President, Commons, and Fellows shall yearly elect four of their number to search the houses of Apothecaries in the said city, and examine drugs, and destroy the same if found defective, and subjecting them to a penalty for neglect of duty, it is enacted,—

"That forasmuch as the Science of Physic doth comprehend, include, and contain the knowledge of Surgery as a special member and part of the same, any of the said Company or Fellowship of Physicians being able, chosen and admitted by the said President and Fellowship of Physicians, may, from time to time, as well within the City of London as elsewhere within this realm, practise and exercise the said science of Physic in all and every his members and parts." This statute, it will be seen, enacts two things as to Medicine and Surgery. It declares, 1st, That Surgery is a part of Medicine or 'Physic;' and, 2nd, Authorises the Physicians of England to practise it throughout the realm.

"Doctors of Medicine are also specially authorised to practise Surgery. By the 14th and 15th Henry VIII., c. 5, (being the Act by which the College of Physicians holds its Charter), it is enacted, 'that no person from henceforth be suffered to exercise or practise in Physic through England, until such time as he be examined at London by the said President and three of the said Elects, and to have given the said President or Elects letters testimonial of their approving and examination, except he be a Graduate of Oxford and Cambridge, who hath accomplished all things for his form without any grace.' It is plain, therefore, that English Medical Graduates and Licentiates have a right to practise Surgery as a part of Physic.

"Now, by the New Medical Act, it is enacted, that 'every person registered under this Act shall be entitled, according to his qualification or qualifications, to practise Medicine or Surgery, or Medicine and Surgery, as the case may be, in any part of Her Majesty's dominions,' etc. Hence, an 'Apothecary' must be a 'Surgeon,' to practise Medicine and Surgery, and a Surgeon must be also a Doctor, or a Physician, or an Apothecary, to practise Medicine; but a Fellow, Licentiate, or Extra-Urban Licentiate of a College of Physicians, or a Bachelor or Doctor of Medicine of the United Kingdom, practising according to his qualification, can, in virtue of the 32nd Henry VIII., c. 40, practise Surgery as a part of Medicine, and need not, therefore, be a Member, Licentiate,

or Fellow of a College of Surgeons. In fact, that explicit enactment was obtained to define the rights of the Physician by law, as to this very point; and so set at rest the disputations of the Barber-Surgeons of the day, in opposition to the Physicians. So that there is nothing more certain in English law, than that the Physician and Doctor of Medicine is entitled, if duly examined, to practise Surgery and act as a Surgeon."

The only remark we have now to make upon this legal opinion of a Medical Professor is that Doctors of Medicine of the London University are specially denied any right of practising "Surgery, Midwifery, or Pharmacy" on the strength of their Medical qualification only; and that until the question has been decided in a Court of Law or by an Amended Medical Act, the easiest and safest course to be taken by the Student who wishes to practise both Medicine and Surgery, in other words to become a General Practitioner, is—

II. That he should obtain a Double Qualification; *i. e.*, he should obtain a Surgical qualification from one of the Colleges of Surgeons and his Medical qualification either by obtaining a University Degree or the Licence of a College of Physicians, or by joining the Apothecaries' Company.

We will conclude, then, that all those Students who do not intend to practise as pure Physicians will strive to obtain the qualification of a College of Surgeons. So far the course is clear. The Regulations of the Colleges will be found in these pages. But a few words are necessary as to the Medical qualifications of the General Practitioner.

1. *Medical Degrees* can only be obtained in British Universities by *residence*, with the exception of that of St. Andrew's, and of the London University, which latter Institution admits to examination qualified Practitioners whose diplomas date before 1840. *At present*, the Diploma of a College of Surgeons entitles the possessor to present himself for examination at St. Andrew's, without any other qualification, or any stipulation as to residence; and *at present* this is the simplest mode of obtaining a respectable Medical degree for any Surgeon—but it is doubtful how long St. Andrew's will sustain its unique position among British Universities, and we cannot advise students to trust to this mode of obtaining the Medical qualification. The Medical degree of the London University is one of the highest honour, and those London Students who can follow the curriculum of this body as now published may well set this degree before them as one well worth striving for.

2. The *Society of Apothecaries*, by a singular anomaly, still retains the right of conferring a Medical qualification. Of late years the *status* of the General Practitioner has been immensely elevated. He is now no longer the man he was a few years ago. His education is expected to be incomparably superior, and his position in society is very much higher. The course of study which he has now to go through is not inferior to that prescribed by our leading Universities. The General Practitioner, therefore, has the best of all titles to any advancement in social position which can be accorded to him by the artifices of corporate distinction. He feels he has become elevated by education and Professional standing to a position which fully justifies him in demanding that he shall no longer be fettered, and dragged captive at the heels of a prosperous trading Company. We say this in no feeling of ill-will towards the Apothecaries' Company; and it is only fair to admit that it might be readily shown how well and how creditably that Company has fulfilled the mission entrusted to it. It has never ceased, from its earliest appearance as a Ruling Power, to elevate and advance the position and the *status* of those it had to rule over; and it is undoubtedly true that the very advances it has thus made in the position of its Licentiates, have been the chief promoting causes which have induced the Licentiates to seek to rid themselves from its dominion. From

the very nature of its constitution, while its Licentiates have thus advanced, it has remained stationary, as a Company, and has been blighted inevitably. The Licentiates have become Professional men, while their *alma mater* has still ever remained a Trading Corporation. The Till and Counter-Trade are still an integral part of "The Hall," but are now things scarcely recognised by those who possess its Licence.

We cannot conceive it possible, therefore, that any Student will seek his Medical qualification from the Apothecaries' Company, unless he feel certain that for some time at least, in the district where he intends to practise, he may be compelled to maintain the right in a Court of Law, of recovering for *medicines supplied in Medical cases*. It is still believed that in England this power is alone possessed by Licentiates of the Apothecaries' Company. Any registered person can recover charges for *attendance*; but if anyone think it necessary also to be able to recover for *medicines*, he had better take the Licence of the Hall. There are also some Lunatic Asylums, Dispensaries, and other public establishments, the governors of which are still likely to make the Apothecaries' Licence a necessary qualification for the office; and this Licence is also in favour with the Poor-Law Board and the Guardians of many Unions. All such requirements must be duly considered by the Student; but we repeat, it is difficult to conceive that anyone who is not compelled by these peculiar circumstances will "go up to the Hall."

3. The *College of Physicians* thus becomes the natural resource for the General Practitioner; in other words, for the Surgeon in search of a Medical qualification. Had the College of Physicians of London done its duty in 1815, the state of things which now requires remedy never would have existed. Addressing Students this time last year, we said:—

"The opportunity for the College of Physicians is a grand one. The power once within its grasp in 1815, but then thrown away, may be acquired now, and the College may become for the first time, a numerous, wealthy, and powerful body. The offer made to the College by Government of examining the great body of English Practitioners as to their qualification to practise, and licensing them accordingly, was rejected before the power was conferred on the Apothecaries' Company. A fine opportunity was lost. Now is the time it may be regained—or never. The Fellows and Licentiates might remain, as at present, Consulting Physicians, but a new class of Associates or Members (or Licentiates, if the present Licentiates had their title changed to that of Member or Associate) might be created, who would obtain a Medical qualification, such as a General Practitioner requires, on moderate terms after a reasonable examination. As 'Members of the Royal College of Physicians and Surgeons,' the General Practitioner would hold an honourable position on the Register and in popular estimation, while the public might be secured against incompetent advisers."

It will be seen that the Colleges of Physicians and Surgeons of Edinburgh have appreciated the importance of the present difficulty, and have agreed upon a combined plan of action, approved by the Medical Council, for granting a double qualification. The regulations will be found at page 317. But the London Colleges hold back. Yet this combined action of the Colleges of Physicians and Surgeons is universally considered as the right solution of the General Practitioner's question. The College of Physicians petitions the Medical Council to aid it in bringing about union in this sense with the College of Surgeons. And then, on the other hand, the College of Surgeons of England, as represented by Mr. Lawrence, appears to be of exactly a similar mind; for here is Mr. Lawrence backing in the Medical Council a proposition of union between the Colleges of Physicians and Surgeons of Edinburgh. Moreover, the Colleges of London have both, on previous occasions, met for this very purpose of combining. Now, are we to understand that these conferences of the London Colleges on this subject are all moonshine? If not, then what is the reason why a question, upon the solution of

which in a like direction, all parties have set their hearts, still sticks halting in limbo? We feel there is serious blame somewhere here attaching to one or other of these bodies. We cannot but believe, that the spirit of *self* alone keeps the matter still in agitation. A meeting of Fellows of the two Colleges, assembling in a truly patriotic spirit, would, we are convinced, settle the difficulty at one sitting. If, however, each College is fighting alone for itself—wishing to gain something and lose nothing—then it is clear that the best interests of the great body of the Profession are being sacrificed to the selfishness of the few. We believe we are not incorrectly stating the case, when we say that this unamiable spirit has heretofore ruled in the conferences which have taken place between the Colleges. We have no patience with those of either College who look on superbly, and exclaim, "What have we to do with the General Practitioner? We are Surgeons; we are Physicians; the General Practitioner must look out for himself. Has he not his Apothecaries' Hall?"

The General Practitioner of this latter half of the nineteenth century will not be an Apothecary unless he is driven to Blackfriars by the selfish and conflicting interests of the ruling spirits of Pall Mall and Lincoln's-inn Fields. We sincerely trust that before another Medical year has passed away, we shall be enabled to inform the Profession, that the Colleges of Surgeons and Physicians of London have united for the purpose of licensing the General Practitioner of England. Such a solution of a most complicated state of things, would, in our own opinion, be as nearly perfect as is possible under all existing circumstances. In the mean time, however, the Students of this year must shape their course by present regulations, not trusting to the future. What those regulations are, is fully laid down in the pages before them.

In conclusion, we have only to offer our best and most sincere wishes to all, that they may pursue their Courses of Study with diligence and pleasure, and may hereafter take an honourable place on the roll of "legally-qualified Medical Practitioners."

RULES AND REGULATIONS OF EXAMINING MEDICAL BODIES IN ENGLAND.

SESSION 1859—1860.

UNIVERSITY OF OXFORD.

OFFICERS, 1859.

Chancellor.—The Earl of Derby, D.C.L.

High Steward.—The Earl of Devon, D.C.L.

Vice-Chancellor.—David Williams, D.C.L., Warden of New College.

Registrar.—Edward Wetherell Rowden, D.C.L., late Fellow of New College.

PROFESSORS.

Regius Professor of Medicine.—H. W. Acland, M.D. Ch. Ch.

Sherardian Professor of Botany.—C. G. B. Daubeny, M.D. Fellow of Magdalen.

Lichfield's Professor of Clinical Medicine.—H. W. Acland, M.D.

Aldrichian's Professor of Anatomy.—Vacant.

Chemistry.—C. Brodie, B.A., Balliol.

Lee's Lecturer in Anatomy.—G. Rolleston, M.D.

FOR DEGREES IN ARTS.

By those who have not taken any degree in Arts, Michaelmas and Hilary terms are each kept by six weeks' residence, and Easter and Trinity terms by three weeks each.

A residence of three weeks in each term is sufficient for Bachelors of Arts keeping terms for a Master's degree.

Sixteen terms are required for the degree of Bachelor of Arts, from all except the sons and eldest sons of the eldest

sons of Peers, etc. But of these sixteen terms, the day of Matriculation, if it be in term, counts for one, and the day of admission to a Bachelor's degree for another; so that, in point of fact, residence for twelve terms only is necessary.

Bachelors of Arts proceed to their M.A. degree in the twenty-seventh term (in the privileged cases twenty-third) from their Matriculation, provided they have kept three weeks' residence after their B.A.

FOR DEGREES IN MEDICINE.

For the degree of Bachelor in Medicine, three years' or twelve terms' residence are necessary, as in the case of candidates for degrees in Arts, with whom they must undergo a public examination, after which three years further are necessary.

A B.M. enjoys the same privilege with the B.C.L. in reference to his M.A. degree.

For a Doctor's degree, three whole years after the Bachelor's are required.

FOR DEGREES IN THE SUPERIOR FACULTIES SUBSEQUENT TO THAT OF MASTER OF ARTS.

The following is the time requisite for degrees in the faculty of Medicine subsequent to that of Master of Arts, all of which date the commencement of the reckoning from the period of regency.

For the degree of Bachelor in Medicine, without proceeding through Arts, all students in that faculty are eligible when they have completed twenty-eight terms from the day of Matriculation; and for a Doctor's three years must intervene from the time of the candidate's having taken his Bachelor's degree.

UNIVERSITY FEES.

1. At Matriculation.—For a Servitor, or Bible-Clerk, 10s. For a Nobleman, or the eldest son of a Peer, 8*l*. For Privileged persons (according to Stat. tit. vi. 5, § 1), not claiming immunity, 5*l*. For all others, 2*l*. 8s. And for non-Academicians, 1*l*.

2. At Graduation.—For the degree of B.A., 7*l*. 10*s*. For the degree of M.A., 12*l*. For the degree of M.A., if he has been admitted to his B.C.L. degree before 29th September, 1855, 4*l*. 5s.; if after that time, 7*l*. For Bachelors in any of the superior faculties, 14*l*., excepting Law, which is 6*l*. 10s. For Doctor in any of the superior faculties, 40*l*. For Bachelor of Music, 5*l*. For Doctor in Music, 10*l*. For a degree by decree of Convocation, or granted to any in their absence, besides the usual fees, 5*l*. For degrees by accumulation, beyond the usual fees, 5*l*. If any M.A. or Doctor, after having quitted the University, shall wish to return, he shall reside twenty-one days in any one Term, and pay a fee of 10*l*. unless he would prefer to pay up the fees due from the time of his leaving the University. If he shall not reside, 20*l*.

3. Incorporation Fees.—B.A., 8*l*.; M.A., 15*l*.; Bachelor in any of the superior faculties, 15*l*.; Doctor in any superior faculty, 40*l*.; B. Mus., 5*l*.; D. Mus., 10*l*. For a Diploma, beyond the usual fees, 10*l*. 10s.

4. Fees ad eundem, 1*l*. Besides the above, every member of the University pays 1*l*. 6s. annually, in four quarterly payments, as University dues. In lieu, however, of this payment, all members having graduated, may at their option compound for all such dues on the following scale, viz.:—If he have not exceeded his 25th year, 22*l*. 15s.; 30th, 21*l*. 15s.; 35th, 20*l*. 12s. 6d.; 40th, 19*l*. 8s. 6d.; 45th, 18*l*.; 50th, 16*l*. 7s. 6d.; 55th, 14*l*. 15s.; 60th, 13*l*. 1s. 6d.; 70th, 9*l*. 6s. 6d.

5. Fees at Examination.—All Undergraduates are called upon to pay fees on entering their names for their respective Examinations; viz., for Responsions, 20s.; the First Public Examination, 21s.; the Final Examination, 21s.; for admission into any second school, 10s.; for Examination in Civil Law, 20s.; and in Medicine, 20s.

EXERCISES FOR DEGREES IN MEDICINE.

All Students (besides undergoing the same examination appointed for Bachelors of Arts) are to be examined by the Regius Professor of that faculty and two examiners, of the degree of Doctor in Medicine, who are appointed by the Vice-Chancellor, in the theory and practice of Medicine, in Anatomy, Physiology, and Pathology; in the *Materia Medica*, as well as in Chemistry and Botany, so far as they illustrate the science of Medicine, and in two at least of the following ancient Medical writers—Hippocrates, Aretæus, Galen, and Celsus. For a Doctor's degree in Medicine, a dissertation

upon some subject, to be approved by the Professor of Medicine, is to be publicly recited in the Schools, and a copy of it afterwards delivered to the Professor.

EXAMINATIONS FOR DEGREES IN ARTS.

All Undergraduates must pass three public trials before they proceed to their B.A. degree; as follow:—

Responsions to be holden three times in each year [*i.e.*, 5th of December; Monday after the 4th Sunday in Lent; Thursday after the first Sunday after Trinity]; and to be passed in the third to the seventh term inclusive.

Subjects.—One Latin, one Greek author, or a portion of each; the chief object being to ascertain that the principles of these two languages are well understood. Arithmetic (which will be required of all), Euclid, or Algebra.

UNIVERSITY OF CAMBRIDGE.

OFFICERS, 1859.

Chancellor.—His Royal Highness Prince Albert, LL.D. Trinity.

High Steward.—Lord Lyndhurst, LL.D., Trinity.

Vice-Chancellor.—W. H. Bateson, D.D., St. John's.

Registrar.—Joseph Romilly, M.A., Trinity.

PROFESSORS.

Regius of Physic.—Henry J. Hayles Bond, Corpus.

Chemistry.—J. Cumming, M.A., F.R.S., Trinity.

Anatomy.—William Clark, M.D., F.R.S., Trinity.

Botany.—Rev. J. S. Henslow, M.A., F.L.S., John's.

Downing Professor of Medicine.—W. W. Fisher, M.D., Down.

Linacre Lecturer on Physic.—G. E. Paget, M.D.

PROCEEDINGS IN PHYSIC.

The Council think it necessary to remark that as, by the provisions of the Medical Act (21 and 22 Vict. c. 90), Bachelors of Medicine will hereafter have the right of registration as qualified to practise Medicine, and it will no longer be necessary for such persons to obtain a licence to practise, it has not been thought necessary to prescribe any course of study or examinations for the licence to practise, but it is proposed to alter the course of study and examinations for the degree of Bachelor of Medicine so as to insure in all who take it the possession of the requisite amount of knowledge.

1. The following regulations were approved by the Senate, February 17, 1859.

BACHELOR OF MEDICINE.

2. Time to be spent in Medical Study.—That five years of Medical study be required of Candidates for the degree of Bachelor of Medicine, with the exception of Students who have graduated as Bachelors of Arts, in whose case four years of Medical study shall be deemed sufficient.

3. That of the time required to be spent in Medical study six terms be so spent in the University, commencing not earlier than after the expiration of the first three terms of residence, provided that four terms so spent shall suffice in the case of any B.A. who shall have taken an honour in the mathematical, classical, natural sciences, or moral sciences tripos.

4. Examinations.—That there be two Examinations for the degree of Bachelor of Medicine; and that the first Examination may be passed by the Student after the completion of three years of Medical study, of which the portion required in his case has been so spent in the University, and the second after the completion of his course of Medical study.

5. Subjects and Course of Study previous to the first Examination.—That the student before admission to the first Examination be required to produce certificates of diligent attendance on one course at least of lectures on each of the following subjects: Chemistry, including manipulations; Botany, Elements of Comparative Anatomy, Human Anatomy and Physiology, Pathology, Materia Medica and Pharmacy. And that he also produce a certificate of having practised dissection during one season at least. The certificates must show that the Lectures on Pathology were attended subsequently to those on Chemistry, and Human Anatomy, and Physiology, and the Lectures on Materia Medica and Pharmacy subsequently to those on Chemistry and Botany.

6. That, as evidence of Medical study in the University, every Student be required to produce certificates of diligent attendance in each term on courses of Lectures on some two

of the following subjects, viz.:—Chemistry, Botany, Human Anatomy and Physiology, Comparative Anatomy, Materia Medica and Pharmacy, Pathology. Or of diligent attendance in each term on a Course of Lectures on some one of those subjects, and also on the Medical Practice of Addenbrooke's Hospital. Certificates of Lectures on any of the above subjects to be deemed satisfactory if the Lectures be delivered either by a Professor of the University, or by some Graduate of the University approved by the Senate; provided that the course in each case, consist of not fewer Lectures than shall have been determined on by the Board of Medical Studies.

7. Subjects of the First Examination.—That the subjects of the first Examination be Chemistry, Botany, Elements of Comparative Anatomy, Human Anatomy and Physiology, Materia Medica and Pharmacy, Pathology, Celsus—the Aphorisms and Epidemics of Hippocrates—Aretæus on the Causes and Signs of Disease—portions of these authors having been selected for examination by the Board of Medical Studies in the year preceding that of the Examination.

8. Examiners for the First Examination.—That the Examiners for the first Examination be as follows:—In Chemistry, Botany, and Comparative Anatomy, the Professors of Chemistry, Botany, and Anatomy respectively, with one additional Examiner for each Professor to be appointed by grace of the Senate. In the remaining subjects of Examination, the Regius Professor of Physic, the Professor of Anatomy, a Doctor of Medicine, being a member of the Senate, nominated annually by the Board of Medical Studies, and elected by the Senate.

9. Additional subjects of Study previous to the Second Examination.—That before admission to the second Examination, the Student be required to produce certificates of having attended one course at least of lectures on each of the following subjects:—Clinical Medicine, Clinical Surgery, Medical Jurisprudence, Obstetrical Medicine. Subjects of the Second Examination.—That the subjects of the Second Examination be Pathology and the Practice of Physic, Clinical Medicine, Medical Jurisprudence, the Medical treatment of Surgical and Obstetrical Diseases.

10. That the Examiners for the Second Examination be the Regius Professor of Physic, the Downing Professor of Medicine, a Doctor of Medicine, being a member of the Senate, nominated annually by the Board of Medical Studies, and elected by the Senate.

Time of the Examinations.—That the first and second Examinations for the degree of Bachelor of Medicine take place each twice annually, first in the week immediately succeeding that in which the division of the Michaelmas term falls; secondly, in the week immediately succeeding that in which the division of the Easter term falls.

Mode of Conducting the Examinations.—That the Examinations be conducted principally by written questions, to which the persons examined be required to give answers in writing.

Hospital Practice.—That the candidate for the degree of Bachelor of Medicine be required to produce certificates of having attended Hospital practice during three years.

11. Public Exercise in the Schools.—That the act required to be kept by the candidate for the degree of Bachelor of Medicine be not kept till after he has passed his Examinations for that degree.

Time of Admission to the Degree of Bachelor of Medicine.—That the Student of Medicine, whether B.A. or not, may be admitted to the degree of Bachelor of Medicine in the eleventh term after the completion of his first term of residence.

Inauguration.—1. That the inauguration of Bachelors of Medicine and perfecting of their degree in every year be on the day of the *Magna Comitia*. 2. That at the inauguration the names be arranged in order of seniority as follows:—(a) Persons who have been Bachelors of Arts arranged alphabetically. (b) Other Bachelors designate of Medicine, arranged alphabetically.

DOCTOR IN MEDICINE.

12. Time to be spent in Medical Study.—That all persons proceeding to the degree of Doctor of Medicine, be required to produce certificates of having been engaged in Medical study during five years.

13. Examinations and Hospital Practice.—That Masters of

Arts, proceeding to the degree of Doctor of Medicine, be required to produce the same certificates of attendance on lectures and of attendance on Hospital practice, and pass the same Examinations as are required for the degree of Bachelor of Medicine.

14. Exemptions in favour of those persons who have obtained Honours in the Natural Sciences Tripos.—That, in the case of every person who has obtained honours in the Natural Sciences Tripos, and has passed with distinction or to the satisfaction of the Examiners for that Tripos the Examination in Botany, Chemistry, or Comparative Anatomy, the Examiners, if required, shall give to such person a certificate, stating that he has passed the Examination in such subjects; and that candidates for the degree of Bachelor of Medicine, or of Doctor of Medicine, possessing such certificates, shall not be required to be examined again in those subjects to which the certificates relate.

15. Certificates.—That all certificates required for the degree of Bachelor of Medicine and for the degree of Doctor of Medicine be delivered to the Regius Professor of Physic before admission to examination for those degrees.

Deputy Examiners.—That in case any of the *ex officio* Examiners for Medical degrees be prevented by illness or other reasonable cause from taking part in such Examinations, it be competent for him to appoint a member of the Senate to examine in his stead, subject to the approbation of the Vice-Chancellor; with the proviso, that in the case of either the Regius Professor of Physic or the Downing Professor of Medicine appointing a deputy, such deputy be a Doctor of Medicine.

Appointment and Salaries of the Additional Examiners.—That the election of the additional Examiners for the Degree of Bachelor of Medicine take place at the first Congregation after the 1st of October in each year. That each of such Examiners receive ten pounds annually from the University chest.

16. Medical Study out of the University.—Medical study out of the University shall in all cases be understood to mean study at some well-known School of Medicine, which has been recognised by the Board of Medical Studies. It shall be the duty of the Board to define, from time to time, what shall be sufficient evidence of such Medical study.

The following Table of Average Expense, regularly incurred by the Student, is calculated for one of the Colleges. The difference is not much at any other College:—

	Annual.	£	s.	d.
Tuition	10	0	0
Rooms, Rent	10	0	0
Attendance, Assessed Taxes, etc.	6	5	0
Coals	3	10	0
College Payments	5	7	4
<i>Cost of Living.</i>				
Breakfast, Dinner, and Tea, at 16s. 6d. a-week for twenty-five weeks, making the average three terms, residence in the year	20	12	6
Laundress	5	8	0
		£61	2	10

Rent of Rooms varies in the several Colleges from £4 to £30; price of lodgings, 8s. to 28s. per week; the most frequent payment is 14s. or 16s.; and half-price is paid in vacations. Entertainment in rooms, attendance of a gyp, orders in the hall are extra and optional. Private tuition is for the most part £14 or £7 a term.

THE LONDON UNIVERSITY.

Visitor.—Her Majesty the Queen.

Chancellor.—The Right Honourable the Earl Granville, K.G., F.R.S.

Vice-Chancellor.—Sir John George Shaw Lefevre, K.C.B., O.C.L., F.R.S.

Registrar.—William Benjamin Carpenter, M.D., F.R.S.

Clerk to the Senate.—Henry Moore.

EXAMINERS.

Medicine.—Archibald Billing, M.D., A.M., F.R.S.; and Alexander Tweedie, M.D., F.R.S.

Surgery.—T. B. Curling, F.R.S.; and W. Fergusson, F.R.S.

Anatomy and Physiology.—Francis Kiernan, F.R.S.; and William Sharpey, M.D., F.R.S.

Physiology and Comparative Anatomy.—Thomas H. Huxley, F.R.S.

Midwifery.—Edward Rigby, M.D.

Chemistry.—Alfred Swaine Taylor, M.D., F.R.S.

Botany.—The Rev. Professor Henslow, M.A.

Materia Medica and Pharmacy.—George Owen Rees, M.D., F.R.S.

BACHELOR OF MEDICINE.

Candidates for the degree of Bachelor of Medicine shall be required:—1. To have been engaged during four years in their professional studies at one or more of the institutions or schools recognised by this University. 2. To have spent one year at least of the four in one or more of the recognised institutions or schools in the United Kingdom. 3. To pass two examinations.

FIRST M.B. EXAMINATION.

The first M.B. Examination shall take place once a-year, and commence on the first Monday in August (a). No candidate shall be admitted to this examination unless he have produced certificates to the following effect:—1. Of having completed his nineteenth year. 2. Of having taken a degree in Arts in this University, or in a University the degrees granted by which are recognised by the Senate of this University (b); or of having passed the Matriculation examination (c). 3. Of having been a student during two years at one or more of the Medical institutions or schools recognised by this University, subsequently to having taken a degree in Arts, or passed the Matriculation Examination. 4, 5, 6, 7. (See TABULAR LIST OF LECTURES, page 325). The certificates shall be transmitted to the Registrar at least fourteen days before the Examination begins. The fee for this examination shall be £5. No candidate shall be admitted to the Examination unless he have previously paid this fee to the Registrar. If a candidate fail to pass the examination, the fee shall not be returned to him; but he shall be afterwards admissible to the first examination without the payment of any additional fee. (For subjects of Examination, see TABULAR LIST.) The candidate shall also be required to translate passages from the Latin Pharmacopoeia.

EXAMINATION FOR HONOURS.

Any candidate who has been placed in the first division at the first M.B. Examination may be examined for honours in any or all of the following subjects:—Anatomy and Physiology (candidates may illustrate their answers by sketching the parts they describe); Chemistry; Materia Medica and Pharmaceutical Chemistry; Structural and Physiological Botany. The Examinations shall take place in the week following the commencement of the first M.B. Examination. [They shall be conducted by means of printed papers; but the examiners shall not be precluded from putting *viva voce* questions upon the written answers of the candidates when they appear to require explanation. In determining the relative position of candidates, the examiners shall have regard to the proficiency evinced by the candidates in the same subjects at the pass examination. Candidates who pass the Examinations, and acquit themselves to the satisfaction of the Examiners, shall be arranged according to the several subjects, and according to their proficiency in each; and candidates shall be bracketed together, unless the Examiners are of opinion that there is a clear difference between them.] If in the opinion of the Examiners sufficient merit be evinced, the candidate who shall distinguish himself the most in Anatomy and Physiology, the candidate who shall distinguish himself the most in Chemistry, and the candidate who shall distinguish himself the most in Materia Medica and Pharmaceutical Chemistry, shall each receive an exhibition of £30 per annum for the next two years. Under the same circumstances, the first and second candidates in each of the preceding subjects shall each receive a gold medal of the value of £5. Under the same circumstances, the candidate who shall distinguish himself the most in Structural and Physiological Botany shall receive a gold medal of the value of £5.

(a) The annual number of examinations will be increased at a future period, should it be found desirable.

(b) The Degrees in Arts of all Universities in the United Kingdom are recognised by the Senate for this purpose.

(c) The Matriculation Examination is the same for Students in Arts as for Students in Medicine.

SECOND M.B. EXAMINATION.

The second M.B. Examination shall take place once a-year and commence on the first Monday in November. No candidate shall be admitted to this Examination within two academical years of the time of his passing the first M.B. examination, nor unless he have produced certificates to the following effect:—1. Of having passed the first M.B. Examination. 2, 3, 4, 5, 6, 7 (see TABULAR LIST). Certificates on Practical Medicine will be received from any legally-qualified Practitioner having the care of the poor of a parish. The candidate shall also produce a certificate of moral character from a teacher in the last school or institution at which he has studied, as far as the teacher's opportunity of knowledge has extended. These certificates shall be transmitted to the Registrar at least fourteen days before the examination begins.

The fee for this examination shall be £5. No candidate shall be admitted to the Examination unless he have previously paid this fee to the Registrar. If a candidate fail to pass the Examination, the fee shall not be returned to him; but he shall be afterwards admissible to the second examination without the payment of any additional fee. (For subjects of examination see TABULAR LIST.) The candidate shall also be required to translate passages of the Latin Pharmacopœia into English, and of the English Pharmacopœia into Latin. On Monday morning in the week following the examination, the examiners shall arrange in two divisions, each in alphabetical order, such of the candidates as have passed. And a certificate, under the seal of the University, and signed by the Chancellor, shall be delivered to each candidate. Such candidates only as in the opinion of the examiners are admissible to the Examination for Honours, shall be placed in the first division.

EXAMINATION FOR HONOURS.

Any candidate who has been placed in the first division at the second M.B. Examination may be examined for Honours in any or all of the following subjects:—Physiology and Comparative Anatomy (candidates may illustrate their answers by sketching the parts they describe); Surgery; Medicine; Midwifery. The examination shall take place in the week following the second M.B. Examination. (The same regulations follow here as in the examination in Honours at the first M.B. Examination.) If, in the opinion of the examiners, sufficient merit be evinced, the candidate who shall distinguish himself the most in Physiology and Comparative Anatomy, the candidate who shall distinguish himself the most in Surgery, and the candidate who shall distinguish himself the most in Medicine, shall each receive an exhibition of £50 per annum for the next two years, with the style of University Medical Scholar. Under the same circumstances, the first and second candidates in each of the preceding subjects shall each receive a gold medal of the value of £5. Under the same circumstances, the candidate who shall distinguish himself the most in Midwifery shall receive a gold medal of the value of £5.

DOCTOR OF MEDICINE.

The examination for the degree of Doctor of Medicine shall take place once a year, and commence on the fourth Monday in November. No candidate shall be admitted to this examination unless he have produced certificates to the following effect:—1. Of having taken the degree of Bachelor of Medicine in this University, or a degree in Medicine or in Surgery at a University, the degrees granted by which are recognised by the Senate of this University (d). Those candidates who have not taken the degree in this University shall produce a certificate of having completed their twenty-third year. 2. Of having attended, subsequently to having taken one of the above degrees in Medicine; a. To Clinical or Practical Medicine during two years in an Hospital or Medical Institution recognised by this University; b. Or, to Clinical or Practical Medicine during one year in an Hospital or Medical Institution recognised by this University, and of having been engaged during three years in the practice of his Profession; c. Or, if he have taken the degree of Bachelor of Medicine in this University, of having been engaged during five years in the practice of his Profession. One year of attendance on Clinical or Practical Medicine, or two years of practice, will be dispensed with in the case of those candidates who at the second

examination have been placed in the first division. 3. Of Moral Character, signed by two persons of respectability. These certificates shall be transmitted to the Registrar at least fourteen days before the examination begins. The fee for the degree of Doctor of Medicine shall be £10. No candidate shall be admitted to the examination unless he have previously paid this fee to the Registrar. If a candidate fail to pass the examination, the fee shall not be returned to him, but he shall be admissible to any subsequent examination for the same degree without the payment of any additional fee. The examination shall be conducted by means of printed papers and *viva voce* interrogation. Candidates shall be examined in the following subjects: Logic and Moral Philosophy, and Medicine.

REGULATIONS RELATING TO PRACTITIONERS IN MEDICINE OR SURGERY DESIROUS OF OBTAINING DEGREES IN MEDICINE (c).
BACHELOR AND DOCTOR OF MEDICINE.—BACHELOR OF MEDICINE.

Candidates shall be admitted to the two examinations for the degree of Bachelor of Medicine on producing certificates to the following effect:—1. Of having been admitted prior to the year 1840 members of one of the legally-constituted bodies in the United Kingdom for licensing Practitioners in Medicine or Surgery; or, of having served previously to 1840 as Surgeons or Assistant-Surgeons in Her Majesty's Army, Ordnance, or Navy, or in the service of the Honourable the East India Company. 2. Of having received a part of their education at a recognised Institution or School, as required by the charter of the University. 3. Of moral character, signed by two persons of respectability. Candidates who have not taken a degree in arts, or passed the matriculation examination in this University, will be required to translate a portion of Celsus *de Re Medica*.

DOCTOR OF MEDICINE.

Candidates who have been engaged during five years in the practice of their Profession shall be admitted to the examination for this degree on producing certificates to the following effect: 1. Of having been engaged during five years in the practice of their Profession. 2. Of having taken the degree of Bachelor of Medicine in the University. Candidates who have not taken a degree in arts, or passed the matriculation examination in this University, will be required to translate a portion of Celsus *de Re Medica*.

UNIVERSITY OF DURHAM.

Warden.—The Venerable Charles Thorp, D.D., F.R.S.
Reader in Medicine.—Dennis Embleton, M.D., F.R.C.S.
Reader in Natural Philosophy.—R. B. Hayward, M.A.
Lecturer in Chemistry.—T. Richardson, M.A.
Registrar.—The Rev. T. Chevallier, B.D.

Students who matriculate at the University of Durham proceed in the first place to a licence in Medicine, then to the degrees of Bachelor and Doctor of Medicine in that University. The course required for Students in Medicine occupies four years. One of those years must be spent in the University, and the other three years either in the University, or in a School of Medicine in the United Kingdom, which has been received into connexion with the University by Convocation. The Newcastle-upon-Tyne College of Medicine is thus in connexion with the University. The Medical School of King's College, London, and the Senior Medical School of Queen's College, Birmingham, are also recognised for the same purpose. The year's residence at Durham is usually, but not necessarily, kept at the beginning of the course. During that year, students attend lectures similar to those given to students in Arts in their first year; and, at the end of it, must pass an examination in the rudiments of religion, literature, and science. At the end of the course of four years, candidates for a licence in Medicine must pass a final examination in the Medical sciences. Licentiates may proceed to the degrees of Bachelor and Doctor of Medicine, by writing an essay upon an assigned Medical question, and passing an examination in the same subject; such licentiates being of the standing of twenty-one terms from the date of matriculation for the degree of Bachelor, and of thirty-three terms for the degree of Doctor in Medicine. Any Student in Arts who has passed the first examination for the degree of Bachelor

(d) At present, all candidates for the degree of Doctor of Medicine must have previously obtained the degree of Bachelor of Medicine in this University.

(e) All these Regulations are applicable exclusively to Practitioners who obtained their Licences or Commissions prior to 1840.

of Arts may proceed as a Student in Medicine of the second Year. Any Student who has passed the examination for the degree of Bachelor of Arts is admissible to the final examination in Medicine without passing the former examination appointed for Students in Medicine, and without further residence in the University or in a Medical School, provided he shall have produced certificates of having attended the requisite Medical Lectures and Hospital Practice (a).

ROYAL COLLEGE OF PHYSICIANS, LONDON.

President.—Dr. Thomas Mayo.

Censors.—Drs. Barker, Baly, F. Weber, and Gull.

Treasurer.—Dr. Alderson.

Registrar.—Dr. H. A. Pitman.

Secretary.—Mr. W. Copney.

The following Regulations were issued on the 8th of August, 1859. We print them entire as they are now made public for the first time.

1. Licentiates of the College who shall have been admitted Licentiates before the 1st day of October, 1859; and extra-Licentiates of the College who shall be admitted Licentiates of the College under the Bye-Laws enacted February 16th, 1859; and Graduates in Medicine who shall be admitted Licentiates of the College before the 1st day of March, 1860, under the Bye-Laws enacted February 16th, 1859, shall, from and after the 1st day of October, 1859, be styled Members of the College, provided always that they have, since their admission as Licentiates, obeyed the Bye-Laws, and do engage henceforth to obey the Bye-Laws of the College.

2. The Members of the College shall be alone eligible to the Fellowship. They shall have the use of the Library and Museum, subject to the Regulations relating thereto, and shall be admitted to all Lectures, and shall enjoy such further privileges as may from time to time be defined by the Bye-Laws; but they shall not be entitled to any share in the Government, nor to attend or vote at general meetings, of the Corporation.

3. Any person not engaged in the practice of Pharmacy, who shall have satisfied the College touching his knowledge of Medical and General Science and Literature, and who shall comply with such regulations as are or shall be required by the Bye-Laws, may be proposed to the College to receive a licence to practise Physic, as a Member of the College. The decision of the College shall be determined by ballot.

4. Every candidate for a Member's licence shall furnish proof that he has attained the age of twenty-five years.

5. Every candidate for a Member's licence shall produce a testimonial from a Fellow or Member of the College, satisfactory to the Censors' Board, to the effect that, as regards moral character and conduct, he is a fit and proper person to be admitted a Member of the College.

6. Every candidate for a Members' licence (except such as shall be admissible under the provisions of Chap. XIII. Sect. 15) shall produce proof of his having been engaged, during a period of five years, in the study of Medicine, at a Medical School or Schools, recognised by the College.

7. Every candidate for a Member's licence, who has not taken a degree in Medicine at an University in the United Kingdom (except such as shall be admissible under the provisions of Chap. XIII. Sect. 15), shall produce evidence, satisfactory to the Censors' Board, of his having studied the following subjects:—Anatomy, with Dissections, Physiology, Chemistry, with Practical Chemistry, *Materia Medica* and Botany, Theory and Practice of Medicine, Morbid Anatomy, Principles of Surgery, Midwifery, and the Diseases of Women and Children, Forensic Medicine; of his having attended diligently during three years the Medical Practice, and during nine months the Surgical Practice of a Hospital containing at least 100 beds; and of his having served the office of Clinical Clerk during at least six months.

8. Every candidate for a Member's licence, who has prosecuted his studies abroad, whether in part or to the full extent required by the preceding regulations (except such as shall be admissible under the provisions of Chap. XIII. Sect. 15), shall, nevertheless, bring proof of his having attended during at least twelve months, the Medical Practice of a Hospital in the United Kingdom containing 100 beds.

(a) Under the Medical Act, Licentiates and Graduates of the University of Durham are entitled to register as duly-qualified Practitioners in Medicine.

9. If the Censors' Board should doubt the sufficiency of the certificates and testimonials produced by any Candidate, or his fitness, in any respect, for admission to examination, they may submit the case to a general meeting of the Fellows.

10. No candidate shall be admitted to examination who uses, for the sake of gain, any remedy which he keeps secret.

11. No candidate shall be admitted to examination who is engaged in trade, or who practises Pharmacy, or makes any engagement with a chemist, or any other person, for the supply of Medicine, from which profit is derived, or who practises Physic or Surgery in partnership, by deed or otherwise, so long as that partnership continues.

12. Every candidate for a Member's licence (except in cases specially exempted), shall have given proof of his acquirements by written answers to questions placed before him, and shall have been examined *viva voce* at three separate meetings of the Censors' Board, and shall have been approved by the President and Censors, or by the major part of them, at each examination.

13. The examination shall be conducted as follows:—The candidate shall be examined in Physiology, in Pathology, and in Therapeutics, in three separate examinations, by written questions, as well as *viva voce*, before three meetings of the Censors' Board. In each of the examinations in writing, as well as at each of the *viva voce* examinations, he shall be required to translate into Latin or English, a passage from a Greek Medical work; and into English, a passage from a Latin Medical work; or he may, in lieu of translating the Greek passage, give proof of a competent knowledge of one or more of the modern European languages. At, or in connection with, the second examination before the Censors' Board, the candidate's knowledge of Practical Medicine may be tested by requiring him to examine persons labouring under disease, and to describe morbid specimens. At the commencement of the first *viva voce* examination, the Candidate shall, if required, declare, in writing, at what University or Schools he has studied general literature and science, and what honours have been conferred upon him, in regard to his knowledge of Literature, Science, or Medicine; and such declaration shall, if it seem fit, be recorded in the annals of the College.

14. When the candidate for a Member's licence has already obtained the degree of Doctor or Bachelor in Medicine at an University in the United Kingdom, after a course of study and an examination, satisfactory to the Censors' Board, he shall be exempt from all parts of the examinations herein-before described, except such as relate to Pathology and Therapeutics.

15. In case of any candidate who has attained the age of forty years, the rules laid down in sections 6, 7, and 8, may be dispensed with. He shall, however, produce testimonials of moral character and conduct, and of general and professional acquirements.

16. The Censors' Board having examined and considered these testimonials, may, if they see fit, submit them to the Fellows at a General Meeting, and it shall be determined by the votes of the Fellows present, or of the majority of them, taken by ballot, if required, whether the candidate shall be admitted to such examination, as the Censors' Board may deem sufficient.

17. Any candidate not approved by the Censors' Board shall not, except by special permission of the College, be re-admitted to examination, until after the lapse of a year.

18. Every candidate approved by the Censors' Board shall be proposed, at the next general meeting of Fellows, as qualified to receive a licence to practise Physic, as a Member of the College; and if the majority of the Fellows present shall consent (the votes being taken by ballot), he shall forthwith, on complying with the regulations prescribed by the bye-laws, receive a licence to practise Physic, as a Member of the College.

19. No one shall be admitted to practise Physic as a Member of the College, unless he shall give his assent to the following words, addressed to him by the President or Vice-President, in the presence of the Fellows:—"You give your faith that you will observe and obey the statutes and bye-laws of this College, and submit to such penalties as may be imposed for any neglect or infringement of them; and that you will, to the best of your ability, do all things in the practice of your profession for the honour of the College, and the good of the

public." And after he has been admitted, he shall confirm this promise by affixing his name to the same words, previously committed to writing.

20. The President or Vice-President, addressing the person or persons to be admitted, shall say—"I, A. B., President (or Vice-President) do admit, and give you authority as a Member (or Members) of this College, to teach and to practise Physic, and to enjoy all accompanying honours and privileges whatsoever, here or elsewhere bestowed on Physicians."—And, taking by the hand each Member so admitted, the President or Vice-President shall add—"I wish you all prosperity."

20. Every Member, at the time of his admission, shall have letters testimonial under the seal of the College, in this form:—

"SCIANT OMNES, NOS

"A. B., Presidentem Collegii Regalis Medicorum Londinensis, unâ cum Censoribus, examinâsse et approbâsse ornatissimum virum, C. D., et cum consensu Sociorum ejusdem Collegii, auctoritate nobis a Domino Rege et Parlamento commissâ, ei concessisse liberam facultatem et licentiam tam docendi quam exercendi scientiam et artem medicam, eidemque summis honoribus et privilegiis, quæcunque hic vel alibi Medicis concedi solent, frui dedisse. In cujus rei fidem et testimonium, adjectis Censorum et Registrarii chirographis, sigillum nostrum commune presentibus apponi fecimus, datis ex ædibus Collegii die _____ mensis _____ anno Domini millesimo octingentesimo _____

"Censoribus, _____,"
"Registrario, _____."

N.B.—This document shall be endorsed by the Member with his usual signature, and by the Registrar, with the following words:—"I certify that C. D., to whom these Letters Testimonial have been granted by the College, has been duly admitted to practise Physic, as a Member of the College.

Member.

Registrar.

21. The Fee to be paid for admission as a Member of the College shall be thirty guineas.

RULES OF CONDUCT, AND PENAL BYE-LAWS RELATING TO MEMBERS.

1. Every Member of the College, in prescribing for a patient, shall write on his prescription the date thereof, the name of the patient, and the initial letters of his own name.

2. If two or more Physicians, Fellows or Members of the College, be called in consultation, they shall confer together with the utmost forbearance, and no one of them shall prescribe, or even suggest, in the presence of the patient, or the patient's attendants, any opinion as to what ought to be done, before the method of treatment has been determined by the consultation of himself and his colleagues; and the Physician first called to a patient shall, unless he decline doing so, write the prescription for the medicines agreed upon, and shall sign the initials of the Physician or Physicians called in consultation, he placing his own initials the last. If any difference of opinion should arise, the greatest moderation and forbearance shall be observed, and the fact of such difference of opinion shall be communicated to the patient or the attendants by the Physician who was first in attendance, in order that it may distress the patient and his friends as little as possible.

3. No Member of the College shall accuse a Fellow or another Member of the College, of ignorance of his art; or publicly, or before witnesses not lawful judges in the matter, stigmatise him with opprobrious terms; or officiously, or under colour of a benevolent purpose, offer Medical aid to, or prescribe for any patient whom he knows to be under the care of another legally qualified Medical Practitioner.

4. No Member of the College shall use, for the sake of gain, any remedy which he keeps secret, or follow systematically any line of practice which may bring discredit on the College, or on the Science of Medicine.

5. No Member of the College shall be engaged in trade, or shall practise Pharmacy, or make any engagement with a Chemist, or any other person, for the supply of medicines, from which profit is derived, or practise Physic or Surgery in partnership, by deed or otherwise.

6. If it shall at any time hereafter appear, or be made known to the President and Censors, that any Member of the College has obtained admission to the College by fraud, false statement, or imposition, or has been guilty of any great

crime, or public immorality, or has acted in any respect in a dishonourable or unprofessional manner, or has violated any bye-law, rule, or regulation of the College, the President and Censors may call the Member so offending before the Censors' Board, and having investigated the case, may admonish, or reprimand, or inflict a fine not exceeding £10, or if they deem the case of sufficient importance, may report the case to the College, and thereupon a majority of two-thirds of the Fellows present at a meeting of the Fellows, which must be specially summoned for that purpose, may declare such Member to be no longer a Member of the College, and he shall forfeit all the rights and privileges which he does or may enjoy as a Member, and his name shall be expunged from the list of Members accordingly.

ROYAL COLLEGE OF SURGEONS OF ENGLAND,

LINCOLN'S INN-FIELDS.

President.—James Moncrieff Arnott.*

Vice-Presidents.—John Flint South,* and Cæsar Henry Hawkins.*

The Council.—William Lawrence,* Sir Benjamin Collins Brodie, Bart., Joseph Swan, Edward Stanley,* Joseph Henry Green,* James Luke,* Frederic Carpenter Skey,* Joseph Hodgson,* Thomas Wermald,* John Bishop, Gilbert Wakefield Mackmurdo, Francis Kiernan, William Coulson, George Gulliver, Richard Partridge, John Hilton, Richard Quain, Edward Cock, Samuel Solly, Thomas Tatum, Alexander Shaw.

Board of Examiners in Midwifery.—John Flint South, Dr. Arthur Farre, Dr. Henry Oldham, Dr. Charles West.

Examiners for the Fellowship in Classics, Mathematics, and French.—Goldwin Smith, George Gabriel Stokes, Isidore Brasseur.

Professor of Human Anatomy and Surgery.—John Hilton.
Professor of Comparative Anatomy and Physiology.—William Scovell Savory.

Professor of Histology and Conservator of the Museum.—John Thomas Quekett.

Assistants in the Museum.—Thomas Howard Stewart and James Murie.

Librarian.—John Chatto.

Secretary.—Edmund Belfour.

Assistant Secretary.—E. J. Trimmer.

Clerk.—Thomas Madden Stone.

* Marked thus (*) are Members of the Court of Examiners.

REGULATIONS OF THE COUNCIL

RESPECTING THE PROFESSIONAL EDUCATION OF CANDIDATES FOR THE DIPLOMA OF MEMBER OF THE COLLEGE.

I. Candidates will be required to produce the following certificates, viz.:—

1. Of being twenty-one years of age.
2. Of having been engaged during four years in the acquirement of professional knowledge.
3. Of having studied Practical Pharmacy during three months.
4. Of having attended Lectures on Anatomy delivered not less frequently than four times in each week, during two Winter Sessions.
5. Of having performed Dissections during not less than two Winter Sessions.
6. Of having attended Lectures on Physiology delivered not less frequently than twice in each week, during two Winter Sessions.
7. Of having attended Lectures on Surgery during two Winter Sessions.
8. Of having attended one Course of Lectures on each of the following subjects, viz., Chemistry, Materia Medica, Medicine, and Midwifery.
9. Of having attended at a recognised Hospital or Hospitals in the United Kingdom, the Practice of Medicine, and Clinical Lectures on Medicine during one Winter (a) and one Summer (b) Session.

(a) The Winter Session comprises a period of six months, and, in England, commences on the 1st of October and terminates on the 31st of March.

(b) The Summer Session comprises a period of three months, and, in England, commences on the 1st of May and terminates on the 31st of July.

No Provincial Hospital will be recognised by this College which contains less than 100 Patients; and no Metropolitan Hospital which contains less than 150 Patients.

10. Of having attended, at a recognised Hospital or Hospitals in the United Kingdom, the Practice of Surgery, and Clinical Lectures on Surgery during three Winter and two Summer Sessions.

Those candidates who shall have pursued their studies in Scotland or Ireland will be admitted to examination upon the production of the several certificates required by the Colleges of Surgeons of Edinburgh and Ireland respectively from candidates for their diploma.

Preliminary Education.—It is the intention of the Council to institute an examination, or to require some equivalent evidence, of the candidate's proficiency in the ordinary branches of a liberal education.

II. Members or Licentiates of any legally constituted College of Surgeons in the United Kingdom, and Graduates in Surgery of any University requiring residence to obtain degrees, will be admitted for examination on producing their diploma, licence, or degree, together with proof of being twenty-one years of age, and of having been occupied at least four years in the acquirement of professional knowledge.

III. Graduates in Medicine of any legally constituted College or University requiring residence to obtain degrees, will be admitted for examination on adducing, together with their diploma or degree, proof of having completed the anatomical and surgical education required by the foregoing regulations, either at the school and Hospital of the University where they shall have graduated, or at one or more of the recognised schools and Hospitals in the United Kingdom.

IV. Candidates who shall have attended at recognised Colonial Hospitals and schools (c), the Medical and Surgical practice, and the several courses of lectures, with the demonstrations and dissections required by the foregoing regulations, will be admitted for examination upon producing certificates of such attendance, together with certificates of having attended in London, during one winter session, the surgical practice of a recognised Hospital, and lectures on Anatomy, Physiology and Surgery, with Demonstrations and Dissections.

V. Certificates will not be recognised from any Hospital unless the Surgeons thereto be members of one of the legally constituted Colleges of Surgeons in the United Kingdom; nor from any School of Anatomy and Physiology or Midwifery, unless the teachers in such school be members of some legally constituted College of Physicians or Surgeons in the United Kingdom; nor from any School of Surgery, unless the teachers in such school be members of one of the legally constituted Colleges of Surgeons in the United Kingdom.

VI. Certificates will not be received on more than one branch of science from one and the same lecturer; but Anatomy and Physiology—Demonstrations and Dissections—will be respectively considered as one branch of science; and in those schools in Scotland or Ireland in which such divisions of those subjects is sanctioned by the College of Surgeons in each kingdom, the Institutes of Medicine,—Anatomy, Demonstrations and Dissections,—may be separately certified.

VII. Certificates will not be received from candidates who have studied in London, unless they shall have registered their tickets at the College, as required by the regulations, during the last ten days of January, March, and October in each year; nor from candidates who have studied elsewhere, unless their names shall duly appear in the registers transmitted during such studies from their respective schools.

N.B.—In the certificates of attendance on Hospital practice and on lectures, it is required that the dates of commencement and termination be clearly expressed; and no interlineation, erasure, or alteration will be allowed.

Blank forms of the required certificates may be obtained on application to the Secretary, to whom they must be delivered, properly filled up, ten days before the candidate can be admitted to examination; and all such certificates are retained at the College.

REGULATIONS RELATING TO THE EXAMINATION FOR THE DIPLOMA OF MEMBER OF THE COLLEGE.

I. The examination of candidates for the Diploma of

(c) The recognition of Colonial Hospitals and Schools is governed by the same regulations, with respect to number of patients, to courses of lectures, and to Physicians, Surgeons, and Lecturers, as apply to the recognition of Provincial Hospitals and Schools in England.

Member of this College will be divided into two parts; the first relating to Anatomy and Physiology; the second relating to Pathology, Surgery, and Surgical Anatomy.

The first examination, on Anatomy and Physiology, will be made as practical and demonstrative as possible.

The second examination on Pathology, Surgery, and Surgical Anatomy, will be partly written and partly oral; and the written part of this examination will have the precedence.

II. The examination on Anatomy and Physiology will be held in the months of April, May, July, November, and January.

The examination on Anatomy will be on the recently-dissected subject, and on prepared parts of the Human Body.

Candidates for these examinations are required to signify their desire of being admitted thereto not less than one month previous to the period of examination.

The fee of five guineas will be paid by each candidate prior to his examination on Anatomy and Physiology, and which fee will be allowed in the fee required on his admission as a Member of the College.

Such Students as shall have completed the second session of their anatomical studies, and shall be desirous thereof, will be admitted to the first or Anatomical examination in November or January next. And candidates for the Diploma of the College are now required to undergo the double examination.

REGULATIONS RELATING TO THE PRELIMINARY EXAMINATION OF CANDIDATES FOR THE DIPLOMA OF MEMBER OF THE COLLEGE, WHICH WILL COME INTO OPERATION FROM AND AFTER JANUARY 1, 1861.

That candidates for the Diploma of Member of this College who shall commence their Professional Education on or after January 1, 1861, be required to produce one or other of the following certificates:—

1. Of graduation in Arts at a recognised University.
2. Of an examination for Matriculation, or such other examination as shall, in either case from time to time, be sanctioned by the Council of this College; at a University in the United Kingdom; at a recognised University in the Colonies; or at a recognised foreign University.
3. Of the Oxford or Cambridge Middle Class Examinations; either junior or senior.
4. Of the Preliminary Examination for the Fellowship of this College.
5. Of the Previous Examination of the University of Cambridge.

That candidates who shall not be able to produce one or other of the foregoing certificates, be required to pass an examination in English, Classics, and Mathematics; to be instituted at this College, and to be conducted by the Board of Examiners of the Royal College of Preceptors, under the direction and supervision of the Council of this College, and to include such subjects as may hereafter be determined by this Council. And that the special or particular subjects of examination be published in each preceding year, and the examination from time to time added to or increased, as the opportunities of education may be improved.

THE SOCIETY OF APOTHECARIES,

BLACKFRIARS.

Master.—F. R. Gowar, Esq.

Wardens.—J. Hunter, Esq., and W. Buchanan, Esq.

The Court of Examiners.—W. Dickinson, Esq., Chairman; R. King, W. P. Brodribb, R. H. Robertson, R. Norton, T. Peregrine, R. H. Semple, W. G. T. Dyer, C. Taylor, H. M. Rowdon, T. R. Wheeler, and J. Randall, Esqs.

Secretary to the Court of Examiners.—A. M. Randall, Esq.
Professor of Chemistry and Materia Medica.—W. T. Brande, Esq., D.C.L., F.R.S.

Examiner for the Society's Prizes in Botany.—Joseph D. Hooker, Esq., M.D., F.R.S., F.L.S.

Clerk to the Society.—R. B. Upton, Esq.

Curator of the Society's Botanic Garden.—Mr. Thomas Moore. *Beadle.*—Mr. C. Rivers.

REGULATIONS, ETC.

Every candidate for a certificate of qualification to practise as an Apothecary, will be required to produce testimonials:—

1. Of having passed a preliminary Examination in Classics and Mathematics. Students wishing to attend are requested to send their names and address, to Mr. Rivers, Beadle's

Office, at the Hall, at the latest, one calendar month previous to the day of examination. 2. Of having served an apprenticeship of not less than five years to a Practitioner qualified by the Act of 1815. 3. Of having attained the full age of 21 years. 4. Of good moral conduct. A testimonial of moral character from the gentleman to whom the candidate has been an apprentice, will always be more satisfactory than from any other person. 5. And of having pursued a course of Medical study in conformity with the regulations of the Court. Every candidate, whose attendance on lectures shall commence on or after the 1st of October, 1858, must attend the following lectures and Medical practice during not less than three winter and two summer sessions: each winter session to consist of not less than six months, and to commence not sooner than the 1st nor later than the 15th of October; and each summer session to extend from the 1st of May to the 31st of July.

First Year.—Winter Session.—Chemistry; Anatomy; Dissections. Summer Session.—Materia Medica and Therapeutics; Botany; Practical Chemistry (a).

Second Year.—Winter Session.—Anatomy; Physiology; Dissections; Principles and Practice of Medicine; Clinical Medical Practice (b). Summer Session.—Clinical Medical Practice (b); Midwifery and Diseases of Women and Children, with attendance on cases (not less than twenty) (c); Forensic Medicine and Toxicology; Demonstrations on Morbid Anatomy.

Third Year.—Winter Session.—Clinical Lectures (d) seventy-five; Clinical Medical Practice (b); Demonstrations on Morbid Anatomy.

The above course of study may be extended over a longer period than three winter and two summer sessions, provided the lectures and Medical practice are attended in the order prescribed.

Those gentlemen whose attendance on lectures commenced before the 1st of October, 1858, will be allowed to complete their studies in conformity with the previous regulations of the Court.

Registration of Testimonials.—All testimonials must be given on a printed schedule, and the blanks therein must be filled up by the lecturers themselves. Students will be supplied with schedules at the time of their first registration:—In London, at this Hall. In the Provincial towns, from the gentlemen who keep the registers of the Medical schools; and whose names may be known by application to the secretary of this Court. All students, in London, are required personally to register the several classes for which they have taken tickets; and those only will be considered as complying with the regulations of the Court, whose names and classes in the register correspond with their schedules. Tickets of admission to lectures and Medical practice must be registered in the months of October and May; but no ticket will be registered unless it be dated within seven days from the commencement of the course. Due notice of the days and hours of such registrations will be given from time to time. The Court also require Students at the Provincial Medical schools to register their names in their own handwriting, with the registrar of each respective school, within the first twenty-one days of October, and first fourteen days of May; and to register their certificates of having duly attended lectures or Medical practice within fourteen days of the completion of such attendance.

Examination.—On and after the 1st of August, 1858, the examination of candidates for a certificate of qualification to practise as Apothecaries, was divided into two parts.

First Examination (e), which may be passed after the second Winter Session (provided the candidate has completed the 19th year of his age), will embrace the following sub-

(a) By Practical Chemistry is intended a *specific* course of Instruction in the Laboratory, with an opportunity of Personal Manipulation in the Ordinary Processes of Chemistry, and of acquiring a knowledge of the various Re-Agents for Poisons.

(b) Medical Practice must be attended during the full term of Eighteen Months; Twelve Months at an Hospital connected with a recognised Medical School, and Six Months either at a recognised Hospital or Dispensary, if more convenient.

(c) A Certificate of such attendance will be received from a legally qualified Practitioner.

(d) The Course of Clinical Lectures may be commenced in the Second Summer Session. The Attendance on these Lectures must be certified by one or more of the recognised Physicians of the Hospital.

(e) Every facility will be given to gentlemen who have entered upon their studies previous to the above date, to enable them to present themselves for examination after the second Winter Session.

jects:—Latin, including the Pharmacopœia and Physicians' Prescriptions; Anatomy; Physiology; General and Practical Chemistry; Botany; Materia Medica.

Second Examination, after the third Winter Session (the five years' pupillage being completed):—Practice of Medicine and Pathology; Midwifery, including the Diseases of Women and children; Forensic Medicine and Toxicology. The examination of the candidate for a certificate of qualification to act as assistant to an Apothecary, in compounding and dispensing medicines, will be as follows:—In translating Physicians' Prescriptions, and the Pharmacopœia Londinensis; in Pharmacy and Materia Medica. By the 22nd section of the Act of Parliament, no rejected candidate for a certificate to practise as an Apothecary, can be re-examined until the expiration of six months from his former examination; and no rejected candidate as an assistant until the expiration of three months. The Act directs the following sums to be paid for certificates:—For London, and within ten miles thereof, ten guineas; for all other parts of England and Wales, six guineas. Persons having paid the latter sum, become entitled to practise in London, and within ten miles thereof, by paying four guineas in addition. For an assistant's certificate, two guineas.

Testimonials required of Candidates for the First Examination.—1. Of having been duly articulated to a legally qualified Apothecary, with date of indenture. 2. Of moral character. 3. Of being 19 years of age. 4. Of having completed the curriculum of study to the close of the second Winter Session. 5. Of having passed an examination in classics and mathematics at the Hall. Candidates having entered the study of the Profession before August 1st, 1858, and have passed no classical examination, will be required to read portions of Celsus and Gregory.

Second Examination.—1. Of having passed the first examination. 2. Of moral character. 3. Of having completed five years' apprenticeship, including the period spent at the Hospital, and of being 21 years of age. 4. Of having completed the prescribed curriculum of study. 5. Of having attended twenty cases of Midwifery.

I. Candidates who desire to avail themselves of the newly modified examination must bring evidence—That they are more than 40 years of age. That they have been apprenticed for five years to an Apothecary; or at least that they have been engaged in such a course of study as shall be considered "serving after the manner of an apprentice, for five years," in conformity with the Act of Parliament. That they have attended such lectures and Hospital practice, as were required of Students when their Medical studies commenced, or such as shall be deemed equivalent.

II. The examination of the above candidates will consist—In the translation of Physicians' Prescriptions. In such parts of Chemistry and Materia Medica as bear upon the practice of Medicine and on Toxicology. In Visceral Anatomy. In the Practice of Medicine, including the Diseases of Women and Children. In Midwifery.

ARMY MEDICAL DEPARTMENT.

Director-General.—Thomas Alexander, Esq. C.B., Honorary Surgeon to Her Majesty.

Head of Sanitary Branch.—Dr. Logan, C.B., Inspector-General of Hospitals, Honorary Physician to Her Majesty.

Head of Statistical Branch.—Dr. Balfour, F.R.S., Deputy-Inspector-General.

Head of Medical Branch.—Dr. Mapleton, Deputy-Inspector-General.

Apothecary to the Forces.—F. M. Bassano, Esq.

Staff Surgeons.—Messrs. Fairbairn and Fitzgerald, attached to the office.

Chief Clerk.—John Wimbridge, Esq.

The name of no gentleman can be placed on the list who does not possess a diploma from the Royal College of Surgeons of England, Scotland or Ireland, or from the Faculty of Physicians and Surgeons of Glasgow, or other corporate body legally entitled to grant a diploma in Surgery, as well as a legal qualification to practise Medicine from one of the bodies enumerated in Schedule A of the Medical Act, and who cannot produce testimonials of attendance, in accordance with the Table given at p. 325.

The candidates must be unmarried, not beyond twenty-five years of age, nor under twenty-one years.

A liberal education and a competent knowledge of the Greek and Latin languages are indispensably requisite in every candidate.

The greater the attainments of the candidates, the more eligible will they subsequently be deemed for promotion; as selections to fill vacancies, especially in the higher ranks, will be guided more by reference to such acquirements, than to mere seniority.

Although the British schools are specified, it is to be understood that candidates who have received a regular Medical education in approved foreign Universities or schools will be admitted to examination.

With the exception of Practice of Physic and Clinical Medicine by one teacher, candidates must have attended separate lecturers for each branch of Medical science.

Before promotion from the rank of Assistant-Surgeon to any higher rank, every gentleman must be prepared for such other examination as may be ordered before a Board of Medical officers.

Diplomas, tickets of attendance on lectures, and certificates of regular attendance by each professor or lecturer, must be lodged at the office for examination and registry, at least one week before the candidate appears for examination; likewise certificates of moral conduct and character,—one of them by the parochial minister, if possible. Baptismal certificates are required at the same time; and if the parish register cannot be resorted to, an affidavit from one of the parents, or from some near relative who can attest the fact, will be accepted.

The certificate of the teacher of Practical Anatomy must state the number of subjects or parts dissected by the pupil.

Certificates of lectures and attendance must be from Physicians or Surgeons of the recognised Colleges or Medical Schools of the United Kingdom, or of Foreign Universities.

Note.—All communications to the Director-General not prepaid, to be forwarded, addressed *outside* to "The Under-Secretary of State for War," with the words, "Army Medical Department," at the left-hand corner.

The following is a copy of the warrant by which the rank, pay, and designation of Army Medical officers are now regulated:—

Victoria R.—Whereas, we have taken into our consideration the recommendations of the Commissioners appointed by our authority to inquire into the regulations affecting the sanitary condition of our military forces, and the Medical treatment of the sick and wounded of our army; our will and pleasure is, that, from and after the date of this warrant, the following rules shall be established for the future admission, promotion, and retirement, and the pay, half-pay, relative rank, and allowances of the Medical officers of our army, and that by these rules our Commander-in-chief shall govern himself in recommending officers for admission, promotion, and retirement.

1. The grades of Medical officers in our army shall be four in number, viz.:—

(1.) Inspector-general of Hospitals. (2.) Deputy Inspector-general of Hospitals. (3.) Staff or Regimental Surgeon; who, after twenty years' full-pay service in any rank, shall be styled Surgeon-Major. (4.) Staff or Regimental Assistant-Surgeon.

2. No Candidate shall be admitted to the Competitive examination for a commission in the Medical department of our army who does not possess such a certificate or certificates as would qualify a civilian to practise Medicine and Surgery; and no such candidate shall receive a commission as Assistant-Surgeon until he shall have satisfactorily passed an examination in military medicine, surgery, and hygiene, after attending the authorised course in a general Military Hospital.

3. No Assistant-Surgeon shall be eligible for promotion to the rank of Surgeon until he shall have passed such examination as our principal Secretary of State for War may require, and shall have served on full-pay with the commission of Assistant-Surgeon for five years, of which two shall have been passed in or with a regiment.

4. A Surgeon, whether on the staff or attached to regiments, must have served ten years in the army, with a commission on full-pay, of which two must have been passed, with the rank of Surgeon, in or with a regiment, before he will be eligible for promotion to the rank of deputy Inspector-general of Hospitals.

5. A Deputy Inspector-general of Hospitals must have served five years at home, or three abroad, in that rank, before he shall be eligible for promotion to the rank of Inspector-general.

In cases, however, of emergency, or when the good of the service renders such alteration desirable, it shall be competent for our Secretary of State for War to shorten the several periods of service above mentioned, in such manner as he shall deem fit and expedient.

6. Assistant-Surgeons shall, as a general rule, be promoted to the rank of a Surgeon in the order of their seniority in the service, unless unfit for the discharge of their duties from physical or professional incompetence, or misconduct. In cases of distinguished service, however, an Assistant-Surgeon may be promoted without reference to seniority; and in such cases, with a view to insure the responsibility attaching to an appointment made out of the regular course of promotion, the recommendation in which the services of the officer shall be detailed, shall be published in the general orders of the army and in the *Gazette* in which his promotion appears.

7. All promotion from the rank of Surgeon to that of Deputy-Inspector, and from the rank of Deputy-Inspector to that of Inspector, shall be given by selection for ability and merit; and the grounds of such selection shall be stated to us in writing, and recorded in the office of our Commander-in-Chief, the selection being made from the whole rank of Surgeons, whether styled Surgeons or Surgeons-Major.

8. The rates of pay of the Medical officers of our Army shall be in accordance with the following schedule.

Rank.	After 30 years' Service on Full-pay.	After 25 years' Service on Full-pay.	After 20 years' Service on Full-pay.	After 15 years' Service on Full-pay.	After 10 years' Service on Full-pay.	After 5 years' Service on Full-pay.	Under 5 years' Service on Full-pay.
Inspector - General	£ s. d. 2 5 0	£ s. d. 2 5 0	£ s. d. 2 5 0	£ s. d. 2 5 0	£ s. d. 2 5 0	£ s. d. 2 5 0	£ s. d. 2 5 0
Deputy - Inspector-General	£ s. d. 1 14 0	£ s. d. 1 10 0	£ s. d. 1 8 0	£ s. d. 1 8 0	£ s. d. 1 8 0	£ s. d. 1 8 0	£ s. d. 1 8 0
Surgeon-Major	£ s. d. 1 5 0	£ s. d. 1 2 0	£ s. d. 1 2 0	£ s. d. 1 2 0	£ s. d. 1 2 0	£ s. d. 1 2 0	£ s. d. 1 2 0
Surgeon	£ s. d. 0 18 0	£ s. d. 0 15 0	£ s. d. 0 15 0	£ s. d. 0 15 0	£ s. d. 0 15 0	£ s. d. 0 15 0	£ s. d. 0 15 0
Assistant - Surgeon	£ s. d. 0 13 0	£ s. d. 0 11 6	£ s. d. 0 10 0	£ s. d. 0 10 0	£ s. d. 0 10 0	£ s. d. 0 10 0	£ s. d. 0 10 0

* Or on promotion, should these periods of service not be already completed.

9. In addition to the pay of their ranks, officers at the head of the Medical department on foreign stations shall receive allowances at the undermentioned rates, when serving under the following circumstances, viz.:—

If with an army in the field, of 10,000 men or upwards .. 20s. per day.
 If with an army in the field, of 5000 men or upwards .. 15s. "
 If with an army in the field, of any less number .. 10s. "
 If serving in a colony where the forces consist of 1500 men or upwards .. 5s. "

10. After the date of this warrant every Medical officer placed on half-pay by reduction of establishment, or on the report of a Medical Board, in consequence of being incapacitated by reason of ill-health, caused by wounds, or brought on by the discharge of his duty, shall be allowed the half-pay to which his period of full-pay service may entitle him, according to the following schedule:—

Rank.	After 30 years' Service on Full-pay.	After 25 years' Service on Full-pay.	After 20 years' Service on Full-pay.	After 15 years' Service on Full-pay.	After 10 years' Service on Full-pay.	After 5 years' Service on Full-pay.	Under 5 years' Service on Full-pay.
Inspector - General	£ s. d. 1 17 6	£ s. d. 1 13 6	£ s. d. 1 10 0	£ s. d. 1 10 0	£ s. d. 1 10 0	£ s. d. 1 10 0	£ s. d. 1 10 0
Deputy - Inspector-General	£ s. d. 1 5 6	£ s. d. 1 2 6	£ s. d. 1 1 0	£ s. d. 1 1 0	£ s. d. 1 1 0	£ s. d. 1 1 0	£ s. d. 1 1 0
Surgeon-Major	£ s. d. 0 18 6	£ s. d. 0 16 6	£ s. d. 0 16 6	£ s. d. 0 16 6	£ s. d. 0 16 6	£ s. d. 0 16 6	£ s. d. 0 16 6
Surgeon	£ s. d. 0 13 0	£ s. d. 0 11 0	£ s. d. 0 11 0	£ s. d. 0 11 0	£ s. d. 0 11 0	£ s. d. 0 11 0	£ s. d. 0 11 0
Assistant - Surgeon	£ s. d. 0 10 0	£ s. d. 0 8 0	£ s. d. 0 8 0	£ s. d. 0 8 0	£ s. d. 0 8 0	£ s. d. 0 8 0	£ s. d. 0 8 0

11. With a view to maintain the efficiency of the service, all Medical officers of the rank of Surgeon-major, Surgeon, or Assistant-Surgeon, shall be placed on the retired list when they shall have attained the age of fifty-five years, and all Inspectors-general, and Deputy Inspectors-general, when they shall have attained the age of sixty-five years.

Officers thus superannuated shall be entitled to the rates of half-pay stated in the preceding Schedule.

12. Every Medical Officer who shall have served upon full-pay for twenty-five years and upwards shall have the right to retire upon half-pay, at the rate of seven-tenths of the daily pay he was in the receipt of when thus retiring, provided he shall have served three years in the rank from which he retires, or shall have served in any rank for ten years in the colonies, or five years with an army in the field. But if he shall not have complied with any one of these conditions, he shall be entitled only to half-pay, at the rate of seven-tenths of the daily pay he was in receipt of before his last promotion.

13. Every Medical officer thus claiming to retire, must give six months' notice to the head of his department of his intention to claim this right, prior to his being allowed to retire; and no Medical officer shall have a right to give such notice after he shall be under orders to proceed to any foreign station, until he shall have served at such station for one month.

14. If a Medical officer is placed on half-pay from any other cause than those hereinbefore named, he shall only be allowed a temporary rate of half-pay (not exceeding the rates stated in Clause 10), for such period and at such rate as shall be assigned to him by our Secretary of State for War, on a consideration of the length and character of the services rendered to the public by such Medical officer.

15. On reduction of establishment, the Surgeon and Assistant-Surgeon who are junior in the ranks, shall be the first reduced, and, on restoration to full-pay, the reduced officers who are senior in their rank shall be the first restored.

16. The relative rank of the Medical officers of our army shall be as follows:—Staff or Regimental Assistant-Surgeon as a lieutenant, according to the date of his commission; and, after six years' full-pay service, as captain, according to the date of the completion of such service. Staff or Regimental Surgeon as major, according to the date of his commission; and Surgeon-major, as lieutenant-colonel, but junior of that rank. Deputy Inspector-general of Hospitals, as lieutenant-colonel, according to the date of his commission; and, after five years' full-pay service as Deputy Inspector-general, as colonel, according to the date of the completion of such service. Inspector-general of Hospitals, as Brigadier-general, according to the date of his commission, if with an army in the field, or after three years' full-pay service as Inspector-general, as a major-general, from the date of his joining such army in the field, or according to the date of the completion of such service.

17. Such relative rank shall carry with it all precedence and advantages attaching to the rank with which it corresponds, [except as regards the presidency of courts-martial, where our will and pleasure is, that the senior combatant officer be always President,] and shall regulate the choice of quarters, rates of lodging money, servants, forage, fuel, and light, or allowances in their stead, detention and prize-money. But when a Medical officer is serving with a regiment or detachment, the officer commanding, though he be junior in rank to such Medical officer, is entitled to a preference in the choice of quarters.

18. Medical officers shall be entitled to all the allowances granted by our warrant of 13th July, 1857, on account of wounds and injuries received in action, as combatant Officers holding the same relative ranks.

19. Their families shall in like manner be entitled to all the allowances granted by our warrant of 15th June, 1855, to the families of combatant officers holding the same relative ranks.

20. Medical officers shall be entitled to field allowances, at home and abroad, at the following rates, subject to all the conditions and restrictions laid down in our warrant of 1st July, 1848:—

DAILY RATE.

Rank.	Ordinary.	Extra-ordinary.
REGIMENTAL.		
Assistant-Surgeon, under Six Years' Service ..	s. d. 1 0	s. d. 2 0
" " above Six Years' Service ..	1 6	2 6
Surgeon ..	2 6	4 6
Surgeon-Major ..	2 6	4 6
STAFF.		
Assistant-Surgeon, under Six Years' Service ..	1 6	2 6
" " above Six Years' Service ..	2 0	3 6
Surgeons ..	3 0	5 0
Surgeon-Major ..	3 0	5 0
Deputy Inspector-General, under Three Years' Service ..	4 6	7 6
" " above Three Years' Service ..	6 0	10 0
Inspector-General of Hospitals ..	9 0	15 0

21. Surgeons or Surgeons-major of Infantry regiments shall not in future be subject to any diminution of the allowance of forage, according to the regulations in force, nor to any stoppage out of their daily pay for any ration of hay, straw, or oats supplied for the horse or horses kept by them for the public service.

22. All Staff-Surgeons of the first class and senior Surgeons of Artillery now serving, or who, being now on half-pay, shall hereafter be called upon to serve, shall rank as Surgeons-major from the date of their commissions as Staff-Surgeons of the first class, or Senior Surgeons of Artillery, and shall receive the pay of Surgeon-major, according to the foregoing schedule of full-pay from the date of this warrant, or from the date of being called from half-pay to full-pay; and all Surgeons who have already completed twenty years' full-pay service, or upwards, in any rank, shall have the rank and pay of Surgeons-major from the date of this warrant.

23. Medical officers shall be held entitled to the same honours as other officers of our army of equal relative rank (a).

24. A Medical officer, retiring after a full-pay service of twenty-five years and upwards, may, if recommended for the same by the head of his department, receive a step of honorary rank, but without any consequent increase of half-pay.

25. Good service pensions shall be awarded to the most meritorious Medical officers of our army under such regulations as shall be from time to time determined by us, with the advice of our Secretary of State for War.

26. Six of the most meritorious Medical officers of the Army shall be named My Honorary Physicians, and six My Honorary Surgeons.

Given at Our Court of St. James's, this first day of October, 1858, in the twenty-second year of our reign.

NAVY MEDICAL DEPARTMENT.

Director-General of the Medical Department of the Navy.—Sir John Liddell, Kt. M.D., C.B., F.R.S.

REGULATIONS FOR CANDIDATES FOR THE OFFICE OF ASSISTANT-SURGEON IN THE ROYAL NAVY.

Admiralty, March 1st, 1859.

The Right Honourable the Lords Commissioners of the Admiralty are pleased to direct, that the following Regulations, relative to the Examination of Candidates for the Appointment of Assistant-Surgeon in the Royal Navy, shall in future be adopted:—

That a candidate for entry into the Royal Navy shall make a written application to that effect, addressed to the Secretary of the Admiralty; on the receipt of which application he will be furnished with the Regulations, and a printed form, to be filled up by him, to show if he possesses the required qualifications.

As vacancies occur, the number of candidates required will be ordered to attend at the Admiralty Office, bringing with them the requisite certificates, showing that they are fully qualified by age, professional ability, &c., when they will be examined by a Board of Medical Officers, to be named by their Lordships.

(a) This clause does not extend to the compliments to be paid by Garrison or Regimental Guards as laid down in pages 29 and 30 of the Queen's Regulations for the Army.

Such candidates as shall have been found in all respects competent for the appointment of Assistant-Surgeon, will be forthwith nominated to one of the Naval Hospitals at home, to await appointments to any of Her Majesty's ships; or, should their services not be immediately required, their names will be duly registered for early appointments, as vacancies may occur.

That no person be admitted as an Assistant-Surgeon in the Royal Navy, who shall not produce a certificate of being registered under the Medical Act, and a diploma from one of the Royal Colleges of Surgeons of England, Edinburgh, or Dublin, from the Faculty of Physicians and Surgeons of Glasgow, from Trinity College, Dublin, or from other Corporate Body legally entitled to grant a Diploma in Surgery; nor as a Surgeon, unless he shall produce a certificate from one of the said Colleges, Faculty, or Corporate Body, founded on an examination to be passed subsequent to his appointment of Assistant-Surgeon, as to his fitness for the situation of Surgeon in the Navy; and in every case the person producing such diploma and certificate shall also undergo a further examination, touching his qualifications in all the necessary branches and points of Medicine and Surgery, both at the time of his entry, and after serving three years, to render himself eligible for Surgeon; and that previously to the admission of Assistant-Surgeons into the Navy, it will be required that they produce proof of having received a preliminary classical education, and that they possess, in particular, a competent knowledge of Latin; also

That they are of good moral character; the certificate of which must be signed by the clergyman of the parish, or by a magistrate of the district.

That they have served an apprenticeship, or have been engaged for not less than six months in practical pharmacy.

That their age be not less than twenty years, or more than twenty-six years.

That they have actually attended a recognised Hospital for eighteen months subsequently to the age of eighteen, in which Hospital the average number of patients is not less than one hundred.

That they have been engaged in actual dissections of the human body twelve months; the certificate of which, from the teacher, must state the number of subjects or parts dissected by the candidate.

That they have attended Lectures, etc., on the following subjects, at established schools of eminence, by Physicians or Surgeons of the recognised Colleges of Physicians and Surgeons, in the United Kingdom, for periods not less than hereunder stated; observing, however, that such Lectures will not be admitted if the teacher shall lecture on more than one branch of science, or if the Lectures on Anatomy, Surgery, and Medicine, be not attended during Winter Sessions of six months each:—Anatomy, 18 months; or General Anatomy 12 months, and Comparative Anatomy 6 months. General Surgery 12 months, or Military Surgery 6 months, and General Surgery 6 months. Theory of Medicine, 6 months, Practice of Medicine, 6 months; if the Lectures on the Theory and Practice of Medicine be given in conjunction, then the period required is 12 months. Clinical Lectures (at an Hospital as above), 12 months; on the Practice of Medicine 6 months, on the Practice of Surgery 6 months. Chemistry, 6 months; or Lectures on Chemistry 3 months, and Practical Chemistry 3 months. Materia Medica, 6 months. Midwifery, 6 months; accompanied by certificates stating the number of Midwifery cases personally attended. Botany, 3 months.

In addition to the tickets for the lectures, certificates must be produced from the Professors, etc., by whom the lectures were given, stating the periods (in months) actually attended by the candidates. The time also of actual attendance at an Hospital or Infirmary must be certified; and the tickets, as well as certificates of attendance, age, moral character, etc., must be produced by the candidate previously to his examination.

Although the above are the only qualifications which are absolutely required in candidates for the appointment of Assistant-Surgeon, a favourable consideration will be given to the cases of those who have obtained the degree of M.D. at either of the Universities of Oxford, Cambridge, Edinburgh, Dublin, Glasgow, London, or Aberdeen; or who, by possessing a knowledge of the diseases of the eye, and of any branch of science connected with the Profession, such as

Medical Jurisprudence, Natural History, Natural Philosophy, etc., appear to be more peculiarly eligible for admission into the service, observing, however, that lectures on these or any other subjects cannot be admitted as compensating for any deficiency in those required by the Regulations.

By the rules of the service, no Assistant-Surgeon can be promoted to the rank of Surgeon until he shall have served five years (two years of which must be in a ship actually employed at sea), and can produce a certificate from one of the before-mentioned Colleges, Faculty, or Corporate Body; and it is resolved, that not any certificate of examination from any of the aforesaid Institutions shall be admitted toward the qualification for Surgeon, unless the certificate shall be obtained on an examination passed after a period of not less than three years' actual service; observing, that no one can be admitted to an examination for Surgeon, unless, as hereinbefore mentioned, he can produce a certificate, together with the most satisfactory proof, that he has performed, on the dead body, under the superintendence of a professor or teacher of known eminence, all the capital operations of Surgery, and is perfectly competent to perform any operation with skill and dexterity, and thoroughly acquainted with the anatomy of the parts involved in such operation; without which qualification no one hereafter can be promoted to the higher branches of the service; and whenever Assistant-Surgeons already in the service (whose professional education may not be in accordance with the above) obtain leave to study previously to their passing for Surgeon, they will be required, on their examination, to produce testimonials of their having availed themselves of the period of leave to complete their education agreeably to these regulations generally.

It is also to be observed, that candidates who may be admitted into the Naval Medical Service, must serve in whatever ships, etc., they may be appointed to; and that in the event of their being unable to do so from sea sickness, their names cannot be continued on the Naval Medical List, nor can they, of course, be allowed half-pay.

The following are the regulations as to pay, half-pay, rank, etc., of Naval Medical officers issued by the Admiralty, on the 30th May, 1859:—

Her Majesty having been pleased, by Her Order in Council of the 13th instant, to establish the following regulations with regard to the pay, half-pay, rank, etc., of the Medical officers of the Royal Navy, My Lords hereby make known the same, for the information of all whom it may concern.

1. There shall in future be four grades of Medical officers, viz.:—1. Inspector-general of Hospitals and Fleets. 2. Deputy Inspector-general of Hospitals and Fleets. 3. Surgeon, who after twenty years' service on full-pay, ten of which in the rank of Surgeon, shall be styled Staff-Surgeon. 4. Assistant-Surgeon.

2. No candidate shall be admitted to the examination for a commission in the Medical department of the Royal Navy who does not possess such a diploma as would qualify a civilian to practise medicine and surgery; and no such candidate shall receive a commission as Assistant-Surgeon, until he shall have satisfactorily passed an examination in Naval surgery and hygiene before a board of examiners appointed by the Lords Commissioners of the Admiralty.

3. No Assistant-Surgeon shall be eligible for promotion to the rank of Surgeon, until he shall have passed such examination as the Lords Commissioners of the Admiralty may require; and shall have served on full-pay, with the commission of Assistant-Surgeon, for five years, of which two, at least, shall have been passed on board one or more of Her Majesty's sea-going ships.

4. No Surgeon shall be eligible for promotion to the rank of Deputy Inspector-general of Hospitals and Fleets, until he shall have served ten years in the Royal Navy, on full-pay, of which three, at least, must have been passed in one of Her Majesty's ships, on some one or more foreign stations, with the rank of Surgeon.

5. No Deputy Inspector-general of Hospitals and Fleets shall be eligible for promotion to the rank of Inspector-general, until he shall have served five years at home, or three years abroad, in the rank of Deputy Inspector-general. In cases of emergency, however, or when the good of Her Majesty's Service may render such alteration desirable, it will be competent for the Lords Commissioners of the Admiralty to shorten the several periods of service above-mentioned, in such manner as they shall deem fit and expedient.

6. The rates of full-pay for the Medical officers of the Royal Navy will in future be in accordance with the following schedule:—

Rank.	After 30 years' Service on Full-pay.	After 25 years' Service on Full-pay.	After 20 years' Service on Full-pay.	After 15 years' Service on Full-pay.	After 10 years' Service on Full-pay.	After 5 years' Service on Full-pay.	Under 5 years' Service on Full-pay.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.
Inspector - General of Hospitals and Fleets ..	2 5 0	2 5 0	2 0 0
Deputy Inspector-General of Hospitals and Fleets ..	1 14 0	1 10 0	1 8 0
Staff Surgeon	1 5 0	1 2 0
Surgeon	0 18 0	0 15 0
Assistant - Surgeon	0 13 0	0 11 6	0 10 0

7. Every Medical officer on the active list, now on half-pay, and those who may be placed on half-pay, subsequently to the 13th instant, will be allowed the half-pay to which his period of service on full-pay shall entitle him, according to the following schedule:—

Rank.	After 30 years' Service on Full-pay.	After 25 years' Service on Full-pay.	After 20 years' Service on Full-pay.	After 15 years' Service on Full-pay.	After 10 years' Service on Full-pay.	After 5 years' Service on Full-pay.	Under 5 years' Service on Full-pay.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.
Inspector - General of Hospitals and Fleets ..	1 17 6	1 13 6	1 10 0
Deputy Inspector-General of Hospitals and Fleets ..	1 5 6	1 2 6	1 1 0
Staff Surgeon	0 18 6	0 16 6
Surgeon	0 13 6	0 11 0
Assistant - Surgeon	0 10 0	0 8 0	0 6 0

* Or on promotion, should these periods of Service not have been already completed.

8. With a view to maintain the efficiency of the service, all Medical officers, with the ranks of Staff Surgeon, Surgeon, and Assistant-Surgeon, will be placed on the retired list when they shall have attained the age of 60 years. Deputy Inspectors-general, will be placed on such retired list when they shall have attained the age of 65 years, and Inspectors-general when they shall have attained the age of 70 years. Officers thus superannuated will receive the rates of half-pay mentioned in the preceding schedule.

9. The relative ranks of the Medical officers of the Royal Navy will be as follows:—An Assistant-Surgeon will rank as a Lieutenant in the Army, according to the date of his commission, and after six years' service on full-pay as a Captain in the Army, according to the date of the completion of such service. A Surgeon will rank as Major in the Army, according to the date of his commission, and a Staff-Surgeon as Lieutenant-colonel, but junior of that rank. A Deputy Inspector-general of Hospitals and Fleets will rank as Lieutenant-colonel, according to the date of his commission, and after five years' service on full-pay as Deputy Inspector-general, will rank as Colonel, according to the date of completion of such service. An Inspector-general of Hospitals and Fleets will rank as Brigadier-general, according to the date of his commission, and after three years' service on full-pay as Inspector-general will rank as Major-general, according to the date of completion of such service. Provided always, that no Medical officer, while borne on the books of one of Her Majesty's ships, or employed in establishments on shore, shall be deemed superior in rank to the officer appointed to command such ship or establishment; but such commanding officer shall, under all circumstances, be held to be superior in rank and precedence to every officer under his command.

10. When Medical officers of the Navy may be employed

on shore, on joint service with Her Majesty's Land Forces, such relative rank will carry with it all precedence and advantages attaching to the rank with which it corresponds, and shall regulate the choice of quarters, rates of lodging-money, servants, forage, fuel, and light, or allowances in their stead; but Medical officers serving in the fleet, notwithstanding the relative rank thus conferred upon them, will, in all such details, and also in all matters relating to the duties of the fleet and to the discipline and interior economy of Her Majesty's ships, be subject, as heretofore, to the authority of any executive officer of the Military branch, while on duty, under the general regulations which may from time to time be prescribed by the Lords Commissioners of the Admiralty.

11. Medical officers will share prize money according to the proclamation or proclamations which may be in force at the time being, for regulating the distribution of the proceeds of prizes in the Royal Navy.

12. Medical officers will be entitled to the same allowances on account of wounds and injuries received in action as combatant officers holding the same relative ranks.

13. The families of Medical officers will in like manner be entitled to the same allowances as granted to the families of combatant officers holding the same relative ranks.

14. Medical officers will be held entitled to the same honours as other officers of the Royal Navy of equal relative rank.

15. A Medical officer retiring, after a full-pay service of twenty-five years, may, in cases of distinguished service, receive a step of honorary rank, but without increase of half-pay.

16. Good service pensions will be awarded to the most meritorious Medical officers of the Royal Navy, under such regulations as shall from time to time be determined upon.

17. Four of the most meritorious Medical officers of the Royal Navy will be named "Honorary Physicians," and four "Honorary Surgeons," to Her Majesty.

HER MAJESTY'S INDIAN FORCES.

REGULATIONS FOR THE ADMISSION OF CANDIDATES FOR THE APPOINTMENT OF ASSISTANT-SURGEON.

All natural-born subjects of her Majesty between 21 and 28 years of age, and of sound bodily health, may be candidates for admission into the service of Her Majesty as Assistant-Surgeons in Her Majesty's Indian Forces.

They must subscribe and send in to J. R. Martin, Esq., F.R.S., Examining Medical Officer to the Secretary of State for India in Council, ten days before the period fixed for each examination, a declaration to the following effect:

"I (Christian and Surname at full length), a candidate for employment as an Assistant-Surgeon in Her Majesty's Indian Forces, do hereby declare that I was years of age on the day of last, and that I labour under no constitutional disease or physical debility that can interfere with the due discharge of the duties of a Medical officer; and I also attest my readiness to proceed on duty to India within three months of receiving my appointment."

This declaration must be accompanied by the following documents:—1. Proof of age, either by extract from the Register of the Parish in which the candidate was born, or by his own declaration, pursuant to the Act 5 & 6 William IV., cap. 62. 2. A certificate of moral character from a magistrate, or a minister of the religious denomination to which the candidate belongs, who has personally known him for at least two preceding years. 3. A diploma in Surgery; or a degree in Medicine, provided an examination in Surgery be required for such degree; from some body competent by law to grant or confer such diploma or degree. 4. A certificate of having attended two courses of lectures, of six months each, on the practice of physic, and of having attended, for six months, the practice and clinical instruction of the physicians at some Hospital containing at least, on an average one hundred in-patients; or of having attended one course of lectures, of six months, on the practice of physic, and clinical instruction for twelve months. 5. A certificate of having attended, for three months, the practical instruction given at one of the public Asylums for the treatment of the Insane. 6. A certificate of having attended, for three months, one of the institutions, or wards of an Hospital especially devoted to the treatment of Ophthalmic disease.

Candidates who may not have been able to attend the practice of an Asylum for the Insane, or of an Ophthalmic Hospital, for three months previous to their offering themselves for examination, will not be excluded from examination, but will, if successful in obtaining recommendation for appointments, be required to produce certificates of having attended such practice during the interval between the examination and the time of proceeding to India. 7. A certificate of having attended a course of lectures on Midwifery, and of having conducted at least six labours. 8. A certificate of having acquired a practical knowledge of cupping.

Candidates may also, at their option, send in certificates of attendance at any hospitals, or on any course of lectures, in addition to the above. Attendance on a course of Military Surgery, and the practical study of surgical operations on the dead body, are recommended.

The examination will include the following subjects:—
1. Surgery in all its departments. 2. Medicine, including the Diseases of Women and Children, Therapeutics, Pharmacy, and Hygiene. 3. Anatomy and Physiology, including Comparative Anatomy. 4. Natural History, including Botany and Zoology.

The following are the books recommended in zoology and comparative anatomy:—*Outlines of the Structure of the Animal Kingdom*, by Rymer Jones, or *Cours Élémentaire d'Histoire Naturelle*, par Milne-Edwards; botany, *Lindley's School Botany*, or *Lindley's Elements of Botany*.

The examination will be conducted:—1. By means of written questions and answers. 2. By object examinations and experiments, when the subject admits of such tests. 3. By practical examination of patients, and by operations on the dead body. 4. By *viva voce* examination.

The persons who shall be pronounced by the examiners to be the best qualified in all respects, will be appointed to fill the requisite number of appointments as Assistant-Surgeons in Her Majesty's Indian Forces, and, so far as the requirements of the service will permit, they will have the choice of the Presidency in India to which they shall be appointed, according to the order of merit in which they stand on the list resulting from such examination.

All Assistant-Surgeons are required to subscribe to the Military or Medical, and Medical Retiring Funds, at the Presidencies to which they may be respectively appointed, and to the Military Orphan Society also, if appointed to Bengal.

All Assistant-Surgeons who shall neglect or refuse to proceed to India under the orders of the Secretary of State for India in Council, within three months from the date of their appointment, will be considered as having forfeited it, unless special circumstances shall justify a departure from this regulation.

A copy of these regulations, and any further information, may be obtained on application to the Military Department, East-India House.

The examinations will take place in the months of January and July in each year, and due notice will be given by public advertisement of the days appointed, and of the probable number of candidates to be selected.

The Examiners for Assistant-Surgeons in Her Majesty's Indian Forces having received many inquiries as to the object and extent of the examination in Comparative Anatomy, Zoology, and Botany, have considered it desirable to announce that their objects are,—

1. To ascertain who of the Candidates have devoted especial attention to any of these sciences, and are hence qualified to undertake duties requiring a knowledge of them, as well as the general duties of their profession. Proficiency in these sciences will, in classifying the Candidates by merit, be entitled to great consideration. 2. To encourage all candidates to acquire an elementary knowledge of the structure and affinities of the principal natural families of animals and of plants, with the general plan upon which these are constructed, and the functions and relations of their most important organs. 3. To promote the study of Natural History as a most important adjunct or preliminary to a liberal Medical education; that of Comparative Anatomy, Zoology, or Botany, if properly cultivated, by means of specimens, for even a short period, being eminently calculated to develop habits of close observation, and to strengthen those powers of reasoning upon observed facts, which must be habitually exercised by Medical men everywhere, but which must be exercised

with the greatest energy and promptitude by those who practise in a tropical climate, and who are often thrown wholly upon their own resources. The general examination in these sciences will be elementary, and will embrace a very limited range of technical terms. At the written examination, a considerable number of questions will be put, with the view of allowing each candidate to select such subjects as he has attended to, and, thereby, of enabling the examiners to ascertain the particular departments of science in which the verbal examination should be conducted. With those candidates who have attained proficiency in any branch of these sciences, the verbal examination will be pursued in the branch selected, so as to ascertain the full extent of their knowledge.

THE EXAMINING MEDICAL BODIES IN SCOTLAND. (a)

SESSION 1859—60.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH.

President.—Dr. Alexander Wood.

Secretary.—Dr. Rutherford Haldane.

REGULATIONS RELATING TO ADMISSION TO THE FELLOWSHIP.

Fellows.—No one can be elected a Fellow of the College till he has obtained the degree of Doctor of Medicine. His petition must be presented at a meeting of the College, after the fees shall have been lodged in the Treasurer's hands; and, if a Graduate of any University in Great Britain or Ireland, the motion for his admission may be determined by ballot at the first quarterly meeting of the College—a majority of three-fourths being necessary to carry it in the affirmative. Graduates of Foreign Universities must previously submit to an examination before the examiners of the College, which shall consist, 1. Of a Dissertation in English, on some subject in the Practice of Physic selected by the Examiners, to be written by the candidate in an apartment of the College Hall, under the superintendence of the Examiners. 2. Of a *viva voce* examination in English, chiefly on Symptomatology, Pathology, and Therapeutics of Diseases; but in part, also, on Anatomy, Chemistry, Botany, and Physiology. 3. The Examiners may institute such examination as they may consider advisable for satisfying themselves that the candidate has received a competent education.

Non-resident Fellows.—The mode of election of a Non-resident is the same as that of a Resident Fellow. In his petition he engages, if he come to reside in Edinburgh, to fulfil the whole conditions which the College does or may require of Resident Fellows; but another ballot must take place before he is admitted to that grade by the College. The fees for a Resident Fellowship amount to £130, and for a Non-resident £80, both inclusive of the stamp duty to Government.

Licentiates.—Graduates of British Universities may be admitted Licentiates without any previous trial or examination; and until the 20th of April, 1859, all duly qualified Practitioners, who produce testimonials of moral and Professional character, and who pass an examination in the practice of Medicine may be admitted by ballot. The fee for the licence is now £10.

N.B.—Personal attendance is not necessary in the case of candidates for the Non-resident Fellowship, unless they are Graduates of Foreign Universities, when they must present themselves for examination.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH.

President.—Robert Omond.

Council.—James S. Combe, James Simson, Andrew Wood, Douglas MacLagan, Benjamin Bell, James Dunsmure.

Examiners.—John Gairdner, James Simson, Richard Hill, Wm. Dumbreck, Archibald Inglis, Andrew Wood, P. S. K. Newbigging, Benjamin Bell, James Dunsmure, Douglas MacLagan, John Struthers, James Spence.

(a) Up to the time of putting this Journal to press, we have not been supplied with the Regulations of the University of Edinburgh, and the Marischal College and University of Aberdeen.

Representative in Medical Council.—Andrew Wood.
Inspector of Students' Course of Study.—James Simson.
Conservator of Museum.—W. R. Saunders, M.D.
Librarian.—Archibald Inglis.
Treasurer.—John Gairdner.
Secretary.—John Scott, U.S.

REGULATIONS FOR THE FELLOWSHIP.

Candidates must be twenty-five years of age, and must possess the diploma of the college, or of some other public body legally entitled to grant diplomas in Surgery. Admission is by ballot; the name of the candidate, together with the names of his proposer and seconder, having been duly intimated in the billets calling two meetings. Three-fourths of the votes of those present are required for admission.

No Fellow of the College is allowed to keep an open shop for the sale of drugs; to allow his name to be connected with advertisements or publications of any indelicate or immoral nature; to practise, or profess to practise, by advertisements or otherwise, by the use of or according to any secret remedy or method of treatment, or to connect himself with any person who does so; nor in any other way to conduct himself inconsistently with the honour and decorum which become a Fellow of the College.

All enactments are made at meetings of the whole College, the non-resident Fellows being entitled to attend and vote. The annual election of office-bearers takes place at the October meeting.

REGULATIONS FOR THE DIPLOMA.

The diploma of the College may be obtained either separately or jointly with that of the Royal College of Physicians of Edinburgh. (See the regulations for the joint examination by the two Colleges.) The course of study and the preliminary examination are the same for the separate diploma. The professional examination is conducted exclusively by the College of Surgeons. The fee for the separate diplomas is £10.

REGULATIONS.—COURSE OF STUDY.

Professional Instruction.—The candidate for a surgical diploma must be twenty-one years of age, and must have been engaged, during a period of not less than twenty-seven months, including three winter sessions, in attending—Anatomy, two courses of six months each. Practical Anatomy, twelve months; Chemistry, Materia Medica, and Pharmacy, Institutes of Medicine or Physiology, Practice of Medicine, and Clinical Medicine, of each one course of six months, or, of the last, two courses of three months each, during the period of Hospital attendance. Principles and Practice of Surgery, two courses, six months each; or Principles and Practice of Surgery, and Military Surgery, one course, six months each. Clinical Surgery, two courses, three months each, during the period of attendance at the Hospital where they are delivered. Midwifery and Diseases of Women and Children, Medical Jurisprudence, Botany, and Practical Chemistry, of each one course of three months; or, instead of the last, Analytical Chemistry, three months.

He must also have attended at least six labours (certified), and a course of instruction in Practical Pharmacy, at the laboratory of a Surgeon or apothecary, or of a chemist and druggist recognised by the College, or of a public Hospital or dispensary; and he must produce evidence that he has been engaged in compounding and dispensing medicines for six months, or a certificate of having been for two years a private pupil or apprentice of a regularly-licensed Medical Practitioner keeping a laboratory for dispensing medicines.

The candidate must have also attended, for twenty-four months, a public general Hospital, containing on an average eighty patients, or alternately shall be required to produce evidence of having attended the practice of an Hospital for twenty-one months, and the practice of a public dispensary, specially recognised by the College, for six months.

All candidates for the diploma must be registered at the College, for which, annually, a fee of 5s. is paid.

REGULATIONS TO BE OBSERVED BY CANDIDATES FOR THE DOUBLE QUALIFICATION IN MEDICINE AND IN SURGERY, TO BE CONFERRED CONJOINTLY BY THE ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH, AND THE ROYAL COLLEGE OF SURGEONS OF EDINBURGH.

Exemptions.

1. Students who have passed the preliminary Examination of the Royal College of Physicians or of the Royal College of

Surgeons of Edinburgh, or of the Faculty of Physicians and Surgeons of Glasgow, before the 1st September, 1859, will be exempted from further preliminary examination. 2. Students who have passed the first professional examination of the Royal College of Physicians of Edinburgh, or of the Royal College of Surgeons of Edinburgh, or of the Faculty of Physicians and Surgeons of Glasgow, before the 1st October, 1859, will not be required to undergo a further first examination. 3. Students who commenced their professional studies before the 1st October, 1859, will not be required to attend a class for Pathological Anatomy or General Pathology. 4. Students who commence their professional studies before 1st August, 1861, will be exempted from an examination in Greek, or in lieu of Greek, French, German, or Italian.

Notice.

The Royal College of Physicians of Edinburgh, and the Royal College of Surgeons of Edinburgh, while they still continue to give their diplomas separately, under separate regulations, have made arrangements by which, after one series of examinations, the student may obtain two licences—one in Medicine and one in Surgery.

The general principle of this joint examination is, that it shall be conducted by a Board, in which each body is represented, for examination in those branches which are common to both Medicine and Surgery; but that the College of Physicians shall take exclusive charge of the examination in Medicine, and the College of Surgeons of the examination in Surgery.

The object of the joint examination is to give to students facilities for obtaining from two separate bodies, at less expense, a double qualification in Medicine and in Surgery. Students passing that examination successfully, will be enabled to register two qualifications under the Medical Act,—Licentiate of the Royal College of Physicians of Edinburgh, and Licentiate of the Royal College of Surgeons of Edinburgh.

The arrangement for thus conferring a double qualification is in conformity with Section XIX. of the Medical Act, and the regulations by which it is proposed to be carried out received the special sanction of the General Council of Medical Education and Registration, at a meeting held on the 7th of August, 1859.

It is the earnest desire of both Colleges, that the students who present themselves for their diplomas should bear in mind how essential a liberal education—literary and scientific—is as a preparation for the successful prosecution of the study of Medicine and Surgery; and they invite attention to the fourth chapter of these regulations, which they hope will ensure regard being paid by the student to this very important object at that period of his course of study which precedes his Medical curriculum.

REGULATIONS.—SCHOOLS OF MEDICINE.

1. Every candidate for the Double Qualification must have followed his course of study in a University, or in an established School of Medicine, as defined below; or in a provincial School specially recognised by the Colleges of Physicians and Surgeons of that division of the United Kingdom in which it is situate.

2. Under the title, Established School of Medicine, are comprehended the Medical Schools of those cities of Great Britain and Ireland in which Diplomas in Medicine or Surgery are granted, and such foreign schools as are similarly circumstanced in the countries in which they exist.

3. Every candidate for the double qualification must have passed at least one Winter Session at a University, or at an established School of Medicine, or at one of the schools of the Queen's University in Ireland.

QUALIFICATIONS OF TEACHERS.

1. The following classes of persons shall be entitled to give lectures, which may be attended as part of the course of study:—1st. In the Universities of Great Britain and Ireland, in University and King's Colleges, London, in Queen's College, Birmingham, and in the Queen's Colleges of Cork, Belfast and Galway, in Ireland, the Professors of those Institutions. 2nd. In Edinburgh, resident Fellows of the Royal College of Physicians of Edinburgh, and Fellows of the Royal College of Surgeons of Edinburgh, whose lectures have been sanctioned in each case by the College to which the lecturer

belongs.(a) 3rd. In London, Fellows and Licentiates of the Royal College of Physicians of London, and Fellows and Members of the Royal College of Surgeons of England, whose status as teachers has been admitted by those Colleges. 4th. In Dublin, Fellows and Licentiates of King's and Queen's College of Physicians in Ireland, and Fellows of the Royal College of Surgeons in Ireland. 5th. In Glasgow, Fellows of the Faculty of Physicians and Surgeons of Glasgow, whose lectures have been sanctioned by the Faculty.(b)

2. No courses of lectures will be recognised, delivered subsequently to 1st May, 1839, by a professor or teacher who lectures upon more than one of the branches of instruction included in their curriculum; nor any course delivered by a professor or teacher who, in addition to the said course, lectures upon a branch of instruction, Medical or general, not included in the curriculum, unless such professor or teacher shall have obtained special leave to do so.

3. Notwithstanding the above regulation, the teaching of two branches may be undertaken by one individual, in the following instances, without disqualification being incurred, viz., Anatomy and Practical Anatomy; Chemistry and Practical Chemistry; and further, Clinical Medicine or Clinical Surgery may be taught simultaneously with any one of the other courses of education prescribed in the curriculum, by a Physician or Surgeon qualified according to the regulations of the Colleges, and attached to a public Hospital of the size which those regulations prescribe.

COURSE OF STUDY.

1. Preliminary Instruction.—Every applicant for the double qualification must satisfy the Examiners in Preliminary Education, that he has a competent knowledge of the following branches of study:—1. The Grammatical Structure of the English and Latin languages. 2. Elements of Mathematics, including Arithmetic and Algebra. 3. Natural Philosophy; or in lieu of this, at the option of the candidate, Logic and Mental Philosophy. 4. After August, 1861, a knowledge of Greek, or, in lieu of Greek, at the option of the candidate, French, German, or Italian will be required. The Colleges will, from time to time, fix on books as guides for preparation for examination in the preliminary branches; and intending candidates will be furnished with lists of these on application. The following branches, though not enjoined, are recommended for study:—Comparative Anatomy, Natural History, Geology.

2. Professional Instruction.—The candidate must have been engaged in attending the following separate and distinct courses of lectures during at least four Winter and three Summer Sessions:—Anatomy, two courses,(c) six months each; Practical Anatomy, twelve months; Chemistry, one course, six months; Practical Chemistry, one ditto, three months; (the number of pupils in each class being limited to twenty-five;) or Analytical Chemistry, one ditto, three months; Materia Medica, one ditto;(d) Physiology, or Institutes of Medicine, one ditto,(e) six months; Practice of Medicine, one ditto, six months; Clinical Medicine, twelve months;(f) Principles and Practice of Surgery, one ditto, six months; Clinical Surgery, one ditto, six months; in addition to the above courses of Surgery and Clinical Surgery, one course of either of these at the option of the Student, one ditto, six months(f); Midwifery and the Diseases of Women and Children, one ditto, three months; Medical Jurisprudence, one ditto, three months; Pathological Anatomy, or General Pathology, one ditto, three

(a) Both Colleges enacted, in 1840, statutes regarding the manner of sanctioning lecturers and teachers in the Edinburgh School, by special examination in their several departments.

(b) The only lecturers excepted from this law are those on chemistry and botany, who may be persons non-medical, if recognised after examination by a joint Board of the two Colleges, in conformity with statutes enacted in May, 1847.

(c) The two courses must not be simultaneous.

(d) This course will be accepted for three or for six months, according to the opportunities presented by the school at which the candidate has studied.

(e) In those schools of England and Ireland in which two separate courses of lectures are delivered at separate hours, one on Anatomy, the other on Anatomy and Physiology, the former of these courses will be received as one of the two courses of Anatomy required by the Colleges, and the other as the course of Physiology, or Institutes of Medicine.

(f) Two courses of Clinical Medicine, of three months each, if not simultaneous, will be held equivalent to one course of six months. They must be attended during the period of attendance at the Hospital where they are delivered. The same rules will apply to Clinical Surgery.

months;(g) Botany, one ditto, three months. Besides the above-mentioned courses of lectures, the candidate must have attended at least six cases of labour under the superintendence of a qualified Medical Practitioner, either in a recognised Maternity Hospital, or a Dispensary where midwifery cases are admitted, or in private practice; and must produce a certificate to that effect from the Practitioner under whom he attended. He must also have attended, for six months, a course of instruction in Practical Pharmacy, at the laboratory of a Surgeon or Apothecary, or of a Member of the Pharmaceutical Society of Great Britain, or of a Chemist and Druggist recognised by either College, on special application, or of a public Hospital or Dispensary. Those who produce certificates of having been, for the space of at least two years, private pupils or apprentices to regularly licensed Medical Practitioners keeping laboratories for dispensing medicines, will be held qualified in this branch of instruction.

3. The six-months' courses delivered in *Edinburgh* or *Glasgow* must consist of not fewer than 100 lectures, with the exception of Clinical Medicine and Clinical Surgery. The three-months' courses must consist of not fewer than 50 lectures.

4. The candidate must also have attended, for twenty-four months, a public General Hospital containing on an average eighty patients; or he must have attended such an hospital for twenty-one months, and have also attended, for six months, the practice of a Public Dispensary specially recognised by either College.

5. The following Order of Study is recommended as a guide to the student, though not enjoined:—First Year: Anatomy, Practical Anatomy, Chemistry, Practical or Analytical Chemistry, Botany, the last either in this or the second year, Hospital.—Second Year: Anatomy, Practical Anatomy, Physiology, or Institutes of Medicine, Surgery, Materia Medica, the last either in this or the third year, Hospital.—Third Year: Practice of Physic, Clinical Surgery, Practical Anatomy, Practical Pharmacy, Clinical Medicine, Pathological Anatomy, or Pathology, Hospital.—Fourth Year: Surgery or Clinical Surgery, Midwifery and the Diseases of Women and Children, Clinical Medicine, Medical Jurisprudence, Practical Midwifery, Hospital.

6. It is strongly recommended to students to avail themselves of any opportunities which they may possess of attending lectures on Ophthalmic and Mental Diseases; also on Natural History, Comparative Anatomy, and the use of the Microscope, in addition to the courses of lectures, which are absolutely required.

7. Candidates for the double qualification must conform to the regulations of the Royal College of Surgeons regarding registration and certificates.

PRELIMINARY EXAMINATION IN LITERATURE AND SCIENCE.

1. The Preliminary Examination in Literature and Science shall take place in the first week of November and in the first week of May in each year. This examination may be taken at any period previous to the first professional examination; but it is strongly recommended that it should be taken before the commencement of the professional education.

2. Testimonials of proficiency granted by the National Educational Bodies, according to the following list, shall be accepted as sufficient evidence of preliminary education, and shall exempt from all other non-professional examinations:—A Degree in Arts of any University of the United Kingdom, of the Colonies, or of such other Universities as may be specially recognised from time to time by the Medical Council; Oxford Responsions or Moderations; Cambridge Previous Examinations; Matriculation Examination of the University of London; Oxford Middle-class Examinations, senior and junior; Cambridge Middle-class Examinations, senior and junior; Durham Middle-class Senior Examination; Dublin University Entrance Examination. An examination by any other University of the United Kingdom, equivalent to the Middle-class Examinations of Oxford and Cambridge; a certificate that the holder has successfully passed the preliminary examination of any of the Licensing Bodies under the Medical Act, provided the course of education and the subjects of examination be equivalent to those required for the double qualification.

3. The Preliminary Examination shall be conducted by

(g) This course will not be imperative on Students who have begun their Medical studies before the 1st of October, 1859.

special examiners in Arts, to be chosen from time to time by the Royal College of Physicians of Edinburgh and the Royal College of Surgeons of Edinburgh, associated with assessors, to be sent in equal proportions from the Colleges.

4. Students who intend to offer themselves for the preliminary examination, shall give in their names, addresses, and places of birth to the officer of either college, not later than three days before the day of examination, and shall pay a fee of ten shillings, not to be returned in case of rejection.

PROFESSIONAL EXAMINATIONS.

1. Candidates for the double qualification shall be subjected to two professional examinations, to be conducted at separate times, partly in writing and partly orally.

2. The first examination shall embrace Anatomy, Physiology, Chemistry, and Botany; the second, Pathological Anatomy, Materia Medica, Pharmacy, Medical Jurisprudence, Midwifery, Surgery, and Medicine.

3. Candidates shall not be admitted to the first examination until after twenty-one months of attendance on professional classes.

4. Opportunities for the first examination will be presented four times in each year,—viz., the second Wednesday of the Winter Session, and the first Wednesdays of February, May, and August. On these days the candidates shall assemble for the purpose of writing answers to the questions proposed. The oral examinations will be conducted on the days immediately succeeding.

5. Candidates who desire to pass the first professional examination must apply to the Inspector of Certificates on or before the Saturday preceding the day of examination, and must produce registered tickets and also certificates of attendance in regard to all those courses of study which have reference to the subjects of that examination. They must also produce a certificate of having passed the preliminary examination.

6. The sum of £6 must be paid to the Inspector of Certificates for this examination, not later than 10 a.m. of the day preceding it. This sum will be considered as paid to account of the entire fee of £16 payable for the two diplomas constituting the double qualification.

7. In the case of a candidate being unsuccessful at this examination, £4 will be returned to him, the remaining £2 being retained to meet the expense of the examination.

8. The second examination shall commence on the second Wednesdays of January, March, May, July, and September, and the third Wednesday of November.

9. No candidate shall be admitted to this examination before the termination of his fourth winter session.

10. Applications for examination must be made to the Inspector of Certificates not later than the Saturday previous to the day of examination.

11. Every candidate must produce to the Inspector,—1st, Satisfactory evidence of his having attained the age of twenty-one years; 2nd, The registered tickets and the certificates of his classes; 3rd, A tabular statement (for which a printed form will be furnished by the Inspector) exhibiting the full amount of his professional education, and distinguishing the classes, hospitals, and dispensaries attended during each session of his studies; and 4th, The certificate of his having passed the first professional examination. The tabular statement above referred to, accurately filled up, must be attested by his signature, and will be preserved by the Colleges as a record.

12. The fee payable for this examination, which shall be £10, must be lodged with the Inspector not later than 10 a.m. of the day preceding the examination-day.

13. On the production of the above documents, and after receiving the fees, the Inspector shall give the candidate a letter authorising the examiners to take him on trial.

14. Unsuccessful candidates at either of the first or second examinations shall be remitted to their studies for a period to be determined by the judgment of the examiners, but not in any case less than three months; and their names shall be concealed.

15. In case of a candidate being unsuccessful at the second examination, the fees for that examination will be returned to him; with the exception of the sum of £2, which will be retained to meet the expenses of the examination.

16. In order to test more effectually the practical knowledge of candidates, Anatomical and Botanical specimens, articles of the Materia Medica, Chemical Tests, the Microscope,

and Surgical Apparatus, will be employed during the examinations; and every candidate will be required to write out one or more formulæ of prescription. The examination may also consist in part of the actual examination of persons labouring under disease.

17. Candidates, on showing sufficient reason for it, may be admitted to a special examination, on days other than those appointed above, on paying an extra fee of £5, which will not be returned in the event of their not being successful.

FACULTY OF PHYSICIANS AND SURGEONS, GLASGOW.

REGULATIONS REGARDING THE GRANTING OF THE DIPLOMA IN SURGERY.

Preliminary Instruction.—Every candidate for the diploma of this Faculty must produce evidence of his having attained the age of 21 years. He must, either previously to or during his Medical education, have received regular instruction in Latin and Mathematics; and must have subsequently attended a course of Natural Philosophy of at least three months' duration.

Professional Instruction.—The candidate must have been engaged in attending the following separate and distinct courses of lectures during a period of not less than twenty-seven months, in which must have been included three Winter Sessions of six months' duration each; Anatomy, Practical Anatomy, and Surgery, of each two courses of six months each (or Surgery and Military Surgery, one course of six months each); Chemistry, one course of six months; Practical Chemistry, one course of three months; Institutes of Medicine, Practice of Medicine, Materia Medica, Midwifery, and Diseases of Women and Children, one course of six months each; Medical Jurisprudence and Botany, one course of three months each; General Hospital, with at least eighty beds, twenty-one months; Practical Pharmacy, six months.

The Faculty recommend the following, viz.:—Lectures on the Eye, and Hospital for Eye Diseases (a three months' course of lectures on the eye, with six months' attendance on an Eye Hospital, containing at least twelve beds for operation cases, will be considered equivalent to three months of a general Hospital), Lying-in Hospital, Hospital for Syphilitic Diseases, Pathological Anatomy, Natural History, and Comparative Anatomy, Greek, French, German, and Italian.

Each candidate shall be examined, partly orally, and partly by written question and answer, without the use of books. He shall translate Latin, write prescriptions, and be examined in preparations. The Committee of Examiners being satisfied with these trials, the candidate shall be entitled to his diploma, on taking and subscribing to the declaration, authorised by law, in place of extra-judicial oaths.

The Faculty Registrar is open during the month of November, for the signature of those students who wish to obtain the diploma, and the classes attended by each during the current Session.

An examination in Latin will be held in the first week of November and the first week of May.

The regulation examination days are the first and third Tuesdays in each month.

The fee for the diploma is £10.

UNIVERSITY AND KING'S COLLEGE, ABERDEEN.

Chancellor.—The Right Hon. the Earl of Aberdeen, LL.D.

Lord Rector.—John Inglis, Esq.

Principal.—P. C. Campbell, D.D.

Sub-Principal.—David Thomson, M.A.

Secretary.—David Thomson, M.A.

Curator of Museum.—Andrew Fyfe, M.D.

Librarian.—Rev. John Fyfe, A.M.

Medical School.—The Winter Session commences on the first Monday of November, and terminates on the third Friday of April. Introductory Lecture on the first Monday of November, at 2 o'clock, p.m.

Students are required to matriculate within the first month of the Winter Session, and within the first fortnight of the Summer Session, and no certificate of attendance will be given

without such matriculation. The matriculation fee for all the classes is one sum of 5s. for the Winter, and one of 2s. 6d. for the Summer Session.

Royal Infirmary.—The Hospital is open daily at ten o'clock a.m., and contains upwards of 300 beds. Separate courses on Clinical Medicine and Clinical Surgery are delivered in the Hospital twice a-week.

Physicians.—Dr. Dyce, Dr. Kilgour, Dr. W. Williamson, Dr. Nicol.

Surgeons.—Wm. Keith, Esq., Wm. Pirrie, Esq., David Kerr, Esq., P. Redfern, Esq.

Ophthalmic Surgeon.—John Cadenhead, Esq.

Lecturers on Clinical Medicine and Surgery.—Dr. Kilgour, and William Keith, Esq.

Fee for the Medical and Surgical Practice of the Hospital, 1st year, £3 10s.; 2nd year, making Perpetual, £3, or one sum of £6. Clinical Medicine.—For the first course, £2 2s.; subsequent courses, £1 1s. each. Perpetual, £4 4s. Clinical Surgery.—For the first course, £2 2s.; subsequent courses, £1 1s. each. Perpetual, £4 4s.

Dispensary.—The Aberdeen General Dispensary, Vaccine, and Lying-in Institution, is open to the student on application to the Medical officers. There are annually about 5000 patients, either prescribed for at the Institution, or visited at their own houses.

REGULATIONS TO BE OBSERVED IN GRANTING THE DEGREE OF M.B.

Students shall be entitled to the degree of M.B. who being of the age of twenty-one years, and having completed the curriculum appointed for the degree of M.D. (one *Annus Medicus*, at least, having been passed at King's College), shall, on examination, be found duly qualified; and the fee for such degree shall be Five Guineas. Those who have obtained the degree of M.B. shall be entitled to make application, within twelve years for the degree of M.D. which degree shall be conferred by the Senatus without further examination, on the candidates producing satisfactory evidence that they have creditably pursued the Medical Profession in the interval; and for the degree of M.D. thus conferred, the additional fee of £21 0s. 6d. shall be charged.

REGULATIONS TO BE OBSERVED IN GRANTING THE DEGREE OF M.D.

Candidates for the degree of M.D. must be of the age of twenty-one years complete, previous to examination. Candidates must produce satisfactory certificates of moral character, and of having studied the Classics and Mathematics at a University, or at an academy of acknowledged reputation. All candidates, with the exceptions mentioned below, must have been engaged in the study of Medicine for at least four years—one of which must be passed at King's College, Aberdeen; and must produce evidence of having attended in some recognised School of Medicine the following course of lectures:—Six months' courses,—Anatomy, 2 courses; Chemistry, 1 course; *Materia Medica*, 1 course; Surgery, 1 course; Institutes of Medicine and Physiology, 1 course; Practice of Medicine, 1 course; Midwifery, 1 course. Three months' courses,—Dissections, 2 courses; Practical Chemistry, 1 course; Medical Jurisprudence, 1 course; Clinical Surgery, 1 course; Botany, 1 course; Clinical Medicine, 2 courses.

Attendance on at least two of the above courses during each session is requisite to constitute an *Annus Medicus*. Certificates of attendance on a six months' course of chemistry previous to the commencement of Medical study, will be received. In addition to the above, every candidate must have attended for two years the wards of an Hospital containing 100 beds; and, during three months, a shop or dispensary for the compounding of medicines. Previous to commencing the Medical examination, candidates not having the degree of A.M. will be required to show that they have a competent knowledge of the Latin language, by translating a passage from Celsus. 5. The preceding regulations will be strictly enforced in the case of all Students who commenced their Medical studies at a period subsequent to October 1, 1840. But Practitioners who possess a licence or diploma from any of the Royal Colleges of Physicians or Surgeons, or from the Apothecaries' Company, and who have been engaged for at least five years in the practice of Medicine, will be admitted to examination on producing their licence or diploma, along with satisfactory evidence of good moral cha-

racter, and of having studied the Classics at a University, or at an academy of acknowledged reputation. Fee, £26 5s. 6d.

UNIVERSITY OF ST. ANDREW'S.

REGULATIONS OF THE SENATUS ACADEMICUS, RESPECTING THE EDUCATION OF CANDIDATES FOR THE DEGREE OF DOCTOR OF MEDICINE.

I. Every candidate for a diploma in Medicine, upon presenting himself for examination, shall produce satisfactory evidence—1. Of unexceptionable moral character. 2. Of having had a liberal and classical education. 3. Of having completed the twenty-second year of his age.

II. Fellows, Members, and Licentiates of the Royal Colleges of Surgeons of England, Edinburgh, and Dublin—of the Royal College of Physicians of London—of the Faculty of Physicians and Surgeons of Glasgow—and of the London Apothecaries' Company—are eligible as Candidates for the Degree of Doctor of Medicine, on producing their Diploma or Licence.

N.B.—Notice to Students.—In 1860, the following regulation will come in force:—Every candidate whose Diploma or Licence bears a date later than 1859, will also be required to produce satisfactory evidence from the Physicians in attendance, that he has regularly attended the Medical Practice of a recognised Hospital for at least eighteen months.

III. Candidates not holding any of the qualifications enumerated in the above clause, must produce satisfactory proof that they have regularly attended lectures delivered by Professors in some University, or by Fellows of the Royal Colleges of Physicians or Surgeons of London, Edinburgh, or Dublin, for four complete winter sessions, or for three winter and three summer sessions, on the following branches:—

1. Anatomy, two courses of six months each. 2. Practical Anatomy or Dissections, twelve months. 3. Physiology, one course of six months. 4. Chemistry, one course of six months. 5. Practical Chemistry, one course of three months. 6. Botany, one course of three months. 7. Natural History or Comparative Anatomy, one course of three months. 8. *Materia Medica* and Pharmacy, one course of three months. 9. Midwifery and Diseases of Women and Children, one course of three months. 10. Medical Jurisprudence, one course of three months. 11. Surgery, one course of six months. 12. Clinical Surgery, one course of six months. 13. Practice of Medicine, one course of six months. 14. Clinical Medicine, one course of six months. And that they have diligently attended, for at least two entire years, the Medical Practice in some Public Hospital in Great Britain or Ireland, containing not less than one hundred beds, and having a regular establishment of Physicians, as well as Surgeons.

REGULATIONS RESPECTING THE EXAMINATIONS.

Examiners for Degrees in Medicines.—George E. Day, M.D., F.R.S., Professor of Anatomy and Medicine. Arthur Connell, F.R.S.S.L. and E., Professor of Chemistry. William Pyper, LL.D., Professor of Latin.

Assistant Examiners.—Andrew Anderson, M.D., Professor of Medicine in the Andersonian University, Glasgow. Wm. T. Gairdner, M.D., F.R.C.P., Lecturer on the Practice of Medicine, and on Clinical Medicine, Edinburgh.

The examinations take place twice in the year, commencing on the first Monday in May, and the third Monday in October. The graduation fee is twenty-five guineas. In the event of a candidate being found unqualified, he shall forfeit one-third of the graduation fee; which, however, will be accounted for to him when he passes his examination at a subsequent trial.

Candidates can only be admitted to examination at other periods by a special grace of the Senatus Academicus. The graduation fee in this case is fifty guineas.

The examination by printed papers extends over three days, after which each candidate is submitted to an oral examination.

All candidates are required to give a written translation of a passage from the first four books of Celsus, to write prescriptions in Latin with accuracy, and to be so far acquainted with Greek as to be able to give the meanings of scientific and Medical terms derived from that language.

During the first two days of the examination, the candidates answer printed questions on (1) Chemistry and *Materia Medica*; (2) Anatomy and Physiology; (3) The Practice of

Medicine; (4) The Principles of Surgery and Midwifery. On the third day, they are required to write a short commentary on Medical and on a Surgical or Midwifery case.

The Degree is conferred, at the conclusion of the oral examinations, by the Rector, in the Hall of the Public Library of the University, and the diplomas are signed by the Professors of the University.

Every candidate is required to present himself for registration to the Secretary on or before the Saturday preceding the examination, and to communicate by letter with the Professor of Medicine, at least a fortnight previously, stating what diploma or certificates he intends to produce.

As the examiners receive very frequent applications respecting the course of reading to be pursued, they beg to recommend the following works as especially deserving of perusal:—Fowne's Manual of Chemistry. (Candidates who have been long engaged in Practice are expected to possess, at least, a knowledge of the general principles of the Science, and an acquaintance with the ordinary chemical compounds used in Medicine.) Christison's Dispensatory, or Pereira's *Materia Medica* (especially the sections treating of the mode of action, uses, and administration of Medicines); and the London, Edinburgh, or Dublin Pharmacopœia. Quain's Elements of Anatomy, or Wilson's Anatomist's Vade-Mecum. Carpenter's Principles of Human Physiology, or Kirkes's Handbook of Physiology. Williams's Principles of Medicine, and Watson's Lectures on the Principles and Practice of Physic, or Wood's Treatise on the Practice of Medicine (American.) Miller's Principles and Practice of Surgery, or Fergusson's System of Practical Surgery. Churchill on the Theory and Practice of Midwifery.

Candidates who have acquitted themselves creditably in the first two days' examination are allowed to compete for honours.

Candidates for honours are additionally examined in Comparative Anatomy and Physiology, in the higher departments of Human Physiology and Pathology, and in Medical Jurisprudence; and their practical knowledge of Medicine is tested at the bedside.

FACULTY OF MEDICINE IN IRELAND.

UNIVERSITIES, COLLEGES, COURSES OF STUDY, DEGREES AND LICENCES TO PRACTISE.

THE following bodies grant one or more degrees or licences to practise Medicine or Surgery, and provide courses of instruction in the Medical sciences:—The University of Dublin grants the degrees of M.B. or Bachelor of Medicine; M.D. or Doctor of Medicine; M.C. or Master of Surgery; and also a Surgical licence. The Queen's University in Ireland, with its Provincial Colleges at Belfast, Cork, and Galway; this University confers the degree of M.D. The King and Queen's College of Physicians in Ireland, granting a licence and fellowship. This institution, in connection with the Medical Faculty of the University of Dublin, constitutes the School of Physic in Ireland. The Royal College of Surgeons in Ireland, which grants letters testimonial qualifying to practise Surgery as a Licentiate, and also confers a Fellowship. Fellows and Licentiates of the Colleges of Physicians and Surgeons may obtain from their respective Colleges a diploma in Midwifery. The Rotunda and Coombe Lying-in Hospitals grant diplomas in Midwifery, which are, however, not recognised under the Medical Act. The Governor and Company of the Apothecaries' Hall of Ireland.

The Medical Session in Ireland commences about the first week in November.

UNIVERSITY OF DUBLIN.

The School of Physic was instituted by Act of Parliament (40 Geo. III. c. 84), and consists of the three University Professors, viz., the Professor of Anatomy and Surgery, the Professor of Chemistry, and the Professor of Botany; together with the King's Professors of the City of Dublin, on the foundation of Sir Patrick Dun, viz., the Professors of the Institutes of Medicine, of the Practice of Medicine, and of *Materia Medica* and Pharmacy. The Provost and Senior

Fellows of Trinity College have added to these a Professor of Surgery, and the College of Physicians has added a Professor of Midwifery, and one of Medical Jurisprudence.

The Professors, as specified in the Act of Parliament, are bound to give Clinical Lectures at Sir Patrick Dun's Hospital at least two days in each week during every session; and each Professor lectures during the space of three months in alternate succession.

MATRICULATION.

All Students in Medicine of the University of Dublin must be matriculated by the Senior Lecturer of Trinity College, for which a fee of five shillings is payable under the Act of Parliament; but no such Student shall be obliged to have his name on the College books, or to attend any of the academical duties of the University, unconnected with the School of Medicine and Surgery, unless he desire to obtain a degree in Medicine, or a diploma or degree in Surgery.

No Student can be admitted for the Winter Courses after the 25th of November, or for the Summer Courses after the 20th of May.

DEGREES IN MEDICINE AND SURGERY.

1. *Bachelor in Medicine*.—A Candidate for the degree of Bachelor in Medicine must be a graduate in Arts, and may obtain the degree of Bachelor in Medicine at the same commencement as that at which he receives his degree of B.A., or at any subsequent commencement, provided the requisite Medical education shall have been completed.

The Medical education of a Bachelor in Medicine is of four years' duration, and comprises attendance on the following courses of lectures:—

COURSES OF SIX MONTHS' DURATION OR LONGER.

Anatomy and Physiology; Practical Anatomy, with Anatomical Demonstrations; Surgery; Chemistry; *Materia Medica* and Pharmacy; Institutes of Medicine and Pathology; Practice of Medicine; Midwifery.

Clinical Lectures: Attendance on Sir Patrick Dun's Hospital during nine months, with three consecutive Courses of Clinical Lectures, each of three months' duration. Also nine months' attendance on some general Hospital in Dublin, approved of by the Board, in which Clinical instruction in Medicine and Surgery is delivered.

COURSES OF THREE MONTHS' DURATION.

Botany, in the first week of April, and continued during the months of May and June; Practical Chemistry; Medical Jurisprudence.

Any of the above-named Courses may be attended at the School of the Royal College of Surgeons in Ireland, and three of them, at the discretion of the Candidate, may be attended in the University of Edinburgh, provided the Candidate have kept an *Annus Medicus* in the School of Physic.

An *Annus Medicus*, or a year's attendance in the School of Physic, may be kept in three ways:—1. By attending at least two, or not more than three, of the foregoing courses, which are of six months' duration. 2. By attending one course of six months' and two of three months' duration. 3. By nine months' attendance on Sir Patrick Dun's Hospital, and Clinical Lectures, together with one course of six months' or, in lieu thereof, two courses of three months' duration.

Every pupil, before he be admitted to attend the Clinical Lectures, must pay the Professor £3 3s. for each three months' course of Lectures, and shall enter his name with the Treasurer of Sir Patrick Dun's Hospital, and pay him ten guineas, unless he shall have been matriculated in one of the Universities of Dublin, Oxford, or Cambridge, and shall have continued his studies in Arts, under a tutor, in one of the said Universities, for the space of two years at least; in which case he shall pay the sum of £3 3s. to such Treasurer, for the first half-year, with a proportionate sum for any longer period.

The examination for the degree of Bachelor of Medicine is conducted by the Regius Professor of Medicine, the University Professor of Surgery, the six Professors of the School of Physic, the Professor of Midwifery, and the Professor of Medical Jurisprudence in the College of Physicians. All the Candidates are examined together publicly in the Examination Hall, on two days of the week next preceding that in which the University Commencements are held. The Examination is conducted partly by printed, partly by oral questions.

Total amount of Fees for the Degree of M.B., £11 15s.

2. *Doctor in Medicine*.—A Doctor in Medicine must be

M.B. of at least three years' standing, and must perform exercises for the Degree before the Regius Professor of Physic, in accordance with the Rules and Statutes of the University.

Total amount of Fees for this Degree, £22.

3. **Licentiate in Surgery.**—The licence or diploma in Surgery may be obtained by such Students as are matriculated in Medicine, and have completed at least one year in Arts on the following conditions:—

1. To complete one year in Arts, it shall be necessary to have answered at least one Term Examination, subsequent to the Junior Freshman year; or to have completed the Junior Freshman year only, by passing the Michaelmas Examination of that year, and keeping one previous Term, either by Lectures or by Examination.

2. Students who have not passed an Examination in the Senior Freshman year will be required to attend one Course of Lectures in Logic. Students who have not passed the Junior Sophister year of the Undergraduate Course will be required to attend one Course of Lectures on Mechanics with the Assistant to the Professor of Natural Philosophy.

3. Students so qualified will be admitted to Examination for the Licence in Surgery as soon as they shall have completed the prescribed curriculum.

4. This curriculum shall extend over a period of four years, and shall comprise attendance upon the following Courses of Lectures:—

Anatomy and Physiology ..	Two Courses.
Demonstrations and Dissections ..	Three Courses.
Theory and Practice of Surgery ..	Two Courses.
Practice of Medicine ..	One Course.
Chemistry ..	One Course.
Materia Medica ..	One Course.
Midwifery ..	One Course.
Practical Chemistry ..	} One Course each.
Botany ..	
Medical Jurisprudence ..	

Any of the above-named Courses may be attended at the School of the Royal College of Surgeons in Ireland, provided the Candidate has kept an *Annus Medicus* in the School of Physic.

Also attendance for three Sessions, each of nine consecutive months' duration, on the practice of any of the following Hospitals, together with attendance on the Clinical Lectures on Medicine and Surgery there delivered.

1. Richmond, Whitworth, and Hardwicke Hospitals; 2. Meath Hospital; 3. Stevens' Hospital; 4. Jervis-street Infirmary; 5. City of Dublin Hospital; 6. Mercer's Hospital; 7. St. Vincent's Hospital; 8. Adelaide Hospital.

Of the Courses of Lectures which are of six months' duration, not more than three can be attended during any one Session.

4. Candidates for the Licentiate who have complied with the foregoing regulations must pass an Examination before a Court of Examiners, consisting of the Regius Professor of Physic, the Professors of Anatomy, Surgery, Chemistry, Midwifery, and Botany.

The Examination of each Candidate will be divided into two parts; one of which shall be devoted to Anatomy and Physiology, Surgical Anatomy, the Theory and Practice of Surgery, and Operative Surgery; and the other to the Practice of Medicine, Midwifery, Chemistry, Materia Medica, and Toxicology.

A fee of £2 10s. is charged on taking the diploma.

4. **Master in Surgery.**—The full Degree of Master in Surgery can only be obtained by Students who are Bachelors of Arts, and who have completed the curriculum and passed the Examination required.

The Examination for the Degree of Master in Surgery is conducted publicly in the Examination Hall, during the week next preceding that in which the University Commencements are held.

The curriculum is the same as that for the Licentiate, as given above, with the addition of one Session of nine months' attendance on an Hospital, having at least twenty beds for cases of fever. A Special Certificate for such attendance will be required.

In addition to the subjects of Examination required for the Licentiate, Candidates for the Degree of Master in Surgery will be examined specially in the following subjects:—

Comparative Anatomy.

Medical and Surgical Pathology.

Animal Chemistry.

Ophthalmic Surgery.

They will also be required to perform Surgical operations on the dead subject.

The Examination will be conducted partly by oral and partly by printed questions, and will be continued for four hours each day, for two successive days; the first day being devoted to the printed, and the second to the oral questions.

The constitution of the Court of Examiners is the same as for the Licentiate in Surgery, but Students who have already taken the degree of M.B. will be examined only by the Regius Professor of Physic, the University Professor of Surgery, the Professor of Surgery of the School of Physic, and the Professor of Anatomy and Physiology, and the Professor of Chemistry.

The days of graduation are Shrove-Tuesday, the first Wednesday in July, and the last Wednesday in Michaelmas Terms. Candidates having completed their Medical education can procure from the Registrar of the Professors of the School of Physic a schedule testifying to the correctness of the details of the attendance on Lectures, etc., on producing which a *Licent ad Examinandum* is issued by the Provost and Senior Fellows.

Total amount of fees for the degree of Ch. M., £11 15s.

The Certificates of the Professors of the College of Surgeons are received as qualifications for a *Licent ad Examinandum*.

PRIVILEGES OF MATRICULATED MEDICAL STUDENTS.

The Medical Library at Sir Patrick Dun's Hospital is open on Tuesdays and Fridays, at two o'clock, for the delivery of books to Students, conformably with the regulations of the College of Physicians.

Medical Students, being Junior or Senior Sophisters on the College Books, and in attendance on two of the winter Courses of Medical Lectures are exempted from the Classics of the Junior Sophister year, and from one of the three optional Courses (Mathematical Physics, Experimental Physics, or Classics) of the Senior Sophister year. To obtain this privilege it is necessary that the Student be matriculated in Medicine, and that the proper certificates of his attendance on Medical Lectures be submitted to the Senior Lecturer.

By the Act 40 Geo. III. c. 84, the several Lecturers and Professors of the School of Physic are bound during each Medical Session to return to the Senior Lecturer the names of such Students as have attended their Lectures.

Students in Arts having their names on the College Books, will be permitted to attend one Course free of expense, with each of the University Professors.

No Testimonium, or certificate of attendance, will be issued to such Students until after they have proceeded to their first degree in Medicine. Should the Student who has had the privilege of free attendance desire to obtain an official Testimonium, before proceeding to his Medical degree, he must, on obtaining it, pay to the Professor the usual fee.

THE QUEEN'S UNIVERSITY IN IRELAND,

granting the degree of M.D., is the centre or head of the Queen's Colleges of Belfast, Cork, and Galway, each of which possesses a Faculty of Medicine. The curriculum of Medical study, extends over a period of at least four years, and is subdivided into two periods of two years each; the first period comprises attendance on Chemistry, Botany and Zoology, Anatomy and Physiology, Practical Anatomy, Materia Medica, and Pharmacy. The second period comprises attendance on Anatomy and Physiology, Practical Anatomy, Theory and Practice of Surgery, Midwifery and Diseases of Women and Children, Theory and Practice of Medicine, Medical Jurisprudence. Also, during the first period, Practical Chemistry in a recognised laboratory during three months, and the practice during six months of a Medico-Chirurgical Hospital, containing at least sixty beds, together with Clinical Lectures delivered therein. During the second period three months' Practical Midwifery in a recognised Hospital with not less than thirty beds; three months' Practical Pharmacy; and eighteen months' practice of a Medico-Chirurgical Hospital, containing at least sixty beds, and in which Clinical Instruction is delivered. At least one-third of the courses of Medical Lectures must be attended in some of the Queen's colleges; the remainder may be taken at

the option of the candidate, in any School, College, or University recognised by the Senate of the Queen's University. Candidates are required before graduating to have also attended in one of the Colleges of the University, Lectures on Natural Philosophy, and on one Modern Language, and to have passed the Matriculation Examination. There are two University Examinations, one comprising the subjects of study in the first period, the other the subjects of the second period. Candidates may, if they prefer to do so, pass both these examinations at the same time. The University Examinations are held twice in each year, in June and September. Further information will be found in the "Queen's University Calendar," or may be obtained by application to the Secretary, Queen's University, Dublin Castle.

THE KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.

This College grants a Licence and Fellowship. Candidates must produce proof of having been engaged for at least four years in the study of Medicine, of having attended not less than two of the required courses in each year. These courses are Anatomy, and Physiology, Chemistry, Institutes of Medicine, Materia Medica and Pharmacy, Practice of Medicine, Midwifery, and Diseases of Women and Children, Surgery, Botany, and Medical Jurisprudence; of the last two, courses of three months each; of the remainder, courses of six months each; besides which, six months' dissections with demonstrations, and three months' Practical Chemistry are required. The lectures must have been attended with the Professors of the School of Physic, or others recognised by the College. Hospital attendance for two years and six months, and six months' practice of a Lying-in Hospital are also necessary.

Graduates in Medicine (not honorary) of one of the Universities of the United Kingdom, Licentiates of the Royal College of Physicians of London or Edinburgh, officers holding Medical or Surgical commissions in her Majesty's service, Licentiates of a College of Surgeons, of four years' standing, those who hold the Surgical diploma of Trinity College, Dublin, or Licentiates of a College of Surgeons in the United Kingdom, producing in addition to their diploma, certificates of attendance on a course of lectures on the Institutes of Medicine and on Botany, and on the practice of a Lying-in Hospital for six months, are admissible to examination on producing evidence of their possessing any of the foregoing qualifications. Candidates will be examined on two several days:—On the first day, in Anatomy, Chemistry, Botany, and the Institutes of Medicine; on the second, in Acute and Chronic Diseases, Materia Medica, and Midwifery; those who, in addition to the qualifications just enumerated, are also Graduates in Arts of the Universities of Dublin, Oxford, or Cambridge, are required to undergo the second day's examination only, Botany, and Materia Medica being added in the case of members of a College of Surgeons.

By a regulation of this College, every person receiving its licence is obliged to make a solemn declaration to observe its laws and ordinances, and among other things he solemnly engages not to practise any system or method (so called, for the cure or alleviation of diseases of which the College has disapproved; nor to endeavour to obtain practice, or to attract public notice by advertising, or by any other unworthy means; "I also engage that I will neither permit nor sanction the use of my name by any other party for such purposes, nor in connection with any secret or other remedy; and in case of any doubt relative to the true meaning or application of this engagement, I promise to submit to the judgment of the College." By the Dublin College of Physicians this regulation has been carried out in the letter and in the spirit.

ACTS OF GRACE TO BE IN FORCE UNTIL MAY 1ST, 1860.

Persons possessing any one of the following qualifications (not being Apothecaries) will be admissible to Examination for the Licence in Medicine, and be required to undergo one day's examination only in Acute Diseases, Chronic Diseases, Materia Medica, and Midwifery:—

1. Licentiates or Fellows of either of the Royal Colleges of Physicians of London or Edinburgh.

2. Graduates in Medicine of a University of the United Kingdom.
3. Fellows, Members, or Licentiates of one of the Colleges of Surgeons of the United Kingdom, and those holding the Surgical Diploma of Trinity College, Dublin.
4. Officers holding a Medical or Surgical Commission in Her Majesty's Service.

The Stamp Duty on the Diploma having been repealed, the fee payable by Licentiates in Medicine is now £10 10s.

Any Fellow or Licentiate of the College may, on the production of such qualification as the College shall consider satisfactory, obtain the Diploma in Midwifery, without further examination.—Fee, £2 2s.

Fellows or Licentiates in Medicine, and Licentiates in Midwifery of this College, are entitled by the Medical Act to have their names and qualifications entered as such in the Medical Register, and to practise as Physicians in any part of her Majesty's dominions.

A copy of the Regulations of the College, and of the form of application, may be had on application to the Registrar, or to Messrs. Hodges and Smith, Booksellers and Publishers to the College, 104, Grafton-street.

ROYAL COLLEGE OF SURGEONS, IRELAND.

President.—Christopher Fleming.

Vice-President.—Robert Adams.

Secretary of the College.—Edward Hutton.

Secretary of the Council.—James S. Hughes.

COUNCIL.

Court of Examiners.—Josiah Smyly, R. G. H. Butcher, Richard Tuohill, Thomas Byrne, M. H. Stapleton, B. W. Richardson, Edward A. Stoker.

Examiners in Midwifery.—William Jameson, Robert Johns, Jerome Morgan.

PROFESSORS.

Anatomy and Physiology: Dr. Jacob.
Descriptive Anatomy: Dr. Power and Dr. Bevan.
Surgery: Mr. Porter and Mr. Hargrave.
Practice of Medicine: Dr. Benson.
Chemistry: Dr. Barker.
Materia Medica: Dr. Williams.
Midwifery: Dr. Sawyer.
Medical Jurisprudence: Dr. Geoghegan.
Practical Chemistry: Dr. Barker.
Comparative Anatomy: Dr. Jacob.
Botany: Dr. Mitchell.
Military Surgery: Mr. Tufnell.
Logical Science: John Murray, A.M., LL.D.

Fellows of the College are Members of the Corporation, and are admitted by examination; letters testimonial are granted to Licentiates, and a diploma in Midwifery to Fellows and Licentiates educated and examined in that branch of Surgery.

Candidates for the Fellowship must be 25 years of age, and must give proof of liberal preliminary education and good conduct during professional education. They are required to produce certificates of Surgical studies for six years (three of which must be for exercises in Dublin), and also of practice as House-Surgeon or dresser in an Hospital; as well as certificates of attendance on Hospitals, lectures, and dissections, as required from Licentiates; with the addition of Botany, Comparative Anatomy, and Natural Philosophy. Fee, £26 5s.; if the candidate be a Licentiate, £10 10s.

Candidates for Letters Testimonial are required to produce certificates of preliminary classical education, of four years' professional study (three of them in metropolitan schools),

also three years' attendance on hospital lectures and dissections. Fee, £21.

Candidates for the Midwifery Diploma must be Fellows or Licentiates of the College, are required to produce certificates of attendance on midwifery lectures and practice, with proof of having attended thirty cases of parturition.

Candidates for the Fellowship and Letters Testimonial are publicly examined on two separate days, in Anatomy, Physiology, Surgery, Practice of Medicine, and Pharmacy. The examiners are elected by a sworn jury of the council appointed by lot, teachers being ineligible. Fellows and Licentiates of the College are qualified to practise as Surgeons in any part of the British dominions, and to be appointed Medical officers to the army and navy, public hospitals, infirmaries, dispensaries, and workhouses.

SCHOOL OF PHYSIC IN IRELAND.

Under this head are comprised the educational establishments, partly on the foundation of Trinity College, and partly on the foundation of the late Sir P. Dun, in connexion with the King and Queen's College of Physicians in Ireland.

THE APOTHECARIES' HALL OF IRELAND.

Every candidate must undergo two separate examinations, one for the certificate of Apprentice, the other for the licence to practise. Every candidate for the certificate of Apprentice will be examined in the following books:—In Latin—The Catiline War of Sallust, and the first three books of the *Æneid* of Virgil; in Greek—the Gospel of St. John and the first twenty Dialogues of Lucian, or the first two books of Homer's *Iliad*; in French—*Telemachus*, or the History of Charles XII.; in Science—the first two books of Euclid, and Algebra, to the end of Simple Equations; in Arithmetic, especially decimals; and in English composition. Every candidate for the licence to practice as an Apothecary must lay before the Court the following documents:—1. The Certificate of Apprentice. 2. The Indenture of Apprenticeship for three years, enrolled according to the Act of Parliament, and bearing the certificate of the Licentiate Apothecary to whom he has been indentured, of a good moral character, and of having fulfilled the period of his Apprenticeship. 3. Certificates duly signed that he has diligently attended the following courses of Lectures, delivered at some school of Medicine recognised by the Court:—(The order of study here laid down is recommended for the guidance of Students), Chemistry (six months), Anatomy and Physiology (twelve months), Practical Chemistry (a), Botany and Natural History (three months), *Materia Medica* (six months) (b), Demonstrations and Dissections (twelve months), Theory and Practice of Physic, Surgery, Midwifery, and the Diseases of Women and Children (six months), Medical Jurisprudence (three months), Pathological Anatomy (a course).

Attendance for the entire period of two years, on the Medical and Surgical Practice in an Hospital or Hospitals recognised by the Court, and where Clinical instruction is regularly given; also a certificate of attendance on thirty cases of Midwifery.

The examination for the licence to practise as an Apothecary will occupy two days: the Candidate will be examined, on the *first day*—In Chemistry and General Physics; in Pharmacy, Theoretical and Practical; in *Materia Medica*; in Natural History and Medical Botany; in Anatomy and Physiology; on the *second day*, in the Theory and Practice of Medicine; in Pathology; in Therapeutics; in Midwifery; in Medical Jurisprudence.

The examination for the certificate to act as Assistant to an Apothecary in compounding and dispensing will be confined to the subjects included in the first day's examination as required for "the licence." The Court of Examiners sits every Friday, at two o'clock, and proceeds with the examina-

(a) The Practical Chemistry must be attended in a Laboratory, and no certificate will be received by the Court that does not testify that the candidate has prepared the several Pharmacopœial Preparations which are usually made in the Laboratory.

(b) The *Materia Medica*, if attended in summer, must consist of two courses of three months' duration each.

tion of candidates in the order in which their names appear on the list. Candidates are obliged to lodge their testimonials a clear week before the day of examination. A rejected candidate cannot be re-admitted to examination until the expiration of six months. An examination of Apothecaries' apprentices takes place at the Hall in the first week in May, annually, upon some subject in Pharmaceutical or Physiological Analysis, which is publicly announced by the Court at the commencement of the previous winter session, and a prize of five guineas is awarded to the successful competitor.

Rotunda Lying-in Hospital, Dublin.—This Institution, a monument of the philanthropy of the late Dr. Mosse, contains nearly 130 beds. Upwards of 2000 women are annually admitted. There is a museum and lecture-room, and clinical courses are delivered in winter and summer. There is accommodation for six intern pupils: fees for interns, 20 guineas; for externs, 10 guineas for six months.

Coombe Lying-in Hospital.—Instruction in Midwifery is given in this Institution.

St. Mary's Hospital Medical School.—

The WINTER SESSION will commence on MONDAY, October 3rd, at Eight o'clock p.m., with an INTRODUCTORY ADDRESS by Mr. URE, after which a CONVERSAZIONE will be held in the Museum.

It is a distinctive characteristic of St. Mary's Hospital that the following Medical Appointments are annually conferred upon the Pupils free of every expense. The advantages of FIVE OF THESE APPOINTMENTS far exceed in money value as many SCHOLARSHIPS of Fifty Pounds each. There are four Resident Medical Officers who board (free of all expense) in the Hospital, three of whom are appointed for twelve months, and one (the Obstetric Officer) who is appointed for six months; four Non-Resident Medical Officers; a Medical and a Surgical Registrar; all of whom are appointed by the Weekly Board of Governors on the recommendation of the Medical Committee. Clinical Clerks and Dressers are selected from the best qualified Students. All the above offices are awarded after competition among the qualified Perpetual Pupils of the Hospital.

Physicians—Drs. Alderson, Chambers, Sibson, H. Jones, Sieveking, and Markham. Surgeons—Messrs. Coulson, Lane, Ure, Spencer Smith, Walton, and J. Lane. Physician-Accoucheur—Dr. Tyler Smith. Ophthalmic Surgeon—Mr. White Cooper. Aural Surgeon—Mr. Teynbee. Surgeon-Dentist—Mr. Sercombe.

Further information may be obtained on application to the Dean of the School, who will also furnish the names of Gentlemen in practice in the vicinity of the Hospital willing to receive Pupils to reside with them.

SPENCER SMITH, Dean of the School.

St. Mary's Hospital, August, 1859.

Guy's Hospital.—The Medical Session

commences in OCTOBER. The INTRODUCTORY ADDRESS will be given by Dr. HABERSHON on SATURDAY, October 1, at Two o'clock.

MEDICAL OFFICERS.

Physicians—Thomas Addison, M.D.; G. H. Barlow, M.D.; Owen Rees, M.D., F.R.S.; W. W. Gull, M.D.

Assistant-Physicians—S. O. Habershon, M.D.; S. Wilks, M.D.; F. W. Pavy, M.D.

Surgeons—Edward Cock, Esq.; John Hilton, Esq., F.R.S.; John Birkett, Esq.

Assistant-Surgeons—A. Poland, Esq.; C. Forster, Esq.; T. Bryant, Esq.

Obstetric Physician—Henry Oldham, M.D.

Assistant Obstetric Physician—Braxton Hicks, M.D.

Surgeon-Dentists—T. Bell, Esq., F.R.S.; J. Salter, Esq.

Surgeon of the Eye Infirmary—John F. France, Esq.

LECTURERS.—WINTER SESSION.

Medicine—Owen Rees, M.D., F.R.S.; W. W. Gull, M.D.

Surgery—John Hilton, Esq., F.R.S.; John Birkett, Esq.

Anatomy—Alfred Poland, Esq.; Cooper Forster, Esq.

Physiology—F. W. Pavy, M.D.

Chemistry—Alfred Taylor, M.D., F.R.S.

Demonstrations on Anatomy—Mr. Durham and Mr. Moxon.

Experimental Philosophy—Mr. Durham.

Gentlemen desirous of becoming Students must give satisfactory testimony as to their education and conduct. They are required to pay £40 for the first year, £40 for the second year, and £10 for every succeeding year of attendance, or £100 in one payment entitles a Student to a Perpetual Ticket.

Dressers, Clinical Clerks, Ward Clerks, Obstetric Residents, and Dressers in the Eye Wards, are selected according to merit from those Students who have attended a second year. A Resident House-Surgeon is appointed every six months from those Students who have obtained the College Diploma.

Six Scholarships, varying in value from £25 to £40 each, will be awarded at the close of each Summer Session for general proficiency.

Two Gold Medals will be given by the Treasurer—one for Medicine and one for Surgery.

A Voluntary Examination will take place at entrance, in Elementary Classics, and Mathematics. The three first candidates will receive respectively £25, £20, £15.

Mr. Stoker, Apothecary to Guy's Hospital, will enter Students, and give any further information required.

Guy's Hospital, July, 1859.

St. Bartholomew's Hospital and

MEDICAL COLLEGE.—The WINTER SESSION will commence on OCTOBER 3rd, with an INTRODUCTORY ADDRESS by Mr. HOLDEN, at Seven o'clock p.m.

LECTURES.

Medicine—Dr. Burrows and Dr. Baly.

Surgery—Mr. Lawrence.

Descriptive Anatomy—Mr. Skey and Mr. Holden.

Physiology and General Anatomy—Mr. Savory.

Chemistry—Dr. Frankland.

Superintendence of Dissections—Mr. Callender and Mr. Smith.

SUMMER SESSION, 1860, Commencing May 1.

Materia Medica—Dr. F. Farre.

Botany—Dr. Kirkes.

Forensic Medicine—Dr. Black.

Midwifery, &c.—Dr. West.

Comparative Anatomy—Mr. M'Whinnie.

Practical Chemistry—Dr. Frankland.

HOSPITAL PRACTICE.—The Hospital contains 650 Beds, and relief is afforded to more than 90,000 Patients annually. The In-patients are visited daily by the Physicians and Surgeons, and Clinical Lectures are delivered—On the Medical Cases, by Dr. Burrows and Dr. Farre; on the Surgical Cases, by Mr. Lawrence, Mr. Stanley, Mr. Lloyd, and Mr. Skey. The Out-patients are attended daily by the Assistant-Physicians and Assistant-Surgeons.

COLLEGIATE ESTABLISHMENT.—Students can reside within the Hospital Walls, subject to the rules of the collegiate system, established under the direction of the Treasurer and a Committee of Governors of the Hospital. Some of the Teachers and other Gentlemen connected with the Hospital also receive Students to reside with them.

SCHOLARSHIPS, PRIZES, &c.—At the end of the Winter Session, examination will be held for two Scholarships of the value of £45, for the year. The Examination for Prizes and Certificates of Merit will take place at the end of the Winter and Summer Sessions.

Further information may be obtained from Mr. Paget, Mr. Holden, or any of the Medical or Surgical Officers or Lecturers; or at the Anatomical Museum or Library.

King's College, London.—Medical

DEPARTMENT.—The WINTER SESSION, 1859-60, will commence on SATURDAY, OCTOBER 1, 1859, on which day all Students are expected to attend the Introductory Lecture, at Two o'clock.

The following Courses of Lectures will be given:—

Anatomy—Professor Richard Partridge, F.R.S.

Physiology; General and Morbid Anatomy—Professor Lionel S. Beale, M.B.

Chemistry—Professor W. A. Miller, M.D., F.R.S.

Principles and Practice of Medicine—Professor George Budd, M.D.

Principles and Practice of Surgery—Professor William Fergusson, F.R.S.

KING'S COLLEGE HOSPITAL.

George Budd, M.D., F.R.S.

R. B. Todd, M.D., F.R.S.

George Johnson, M.D.

W. A. Guy, M.B., F.R.S.

Lionel S. Beale, M.B., F.R.S.

Physicians... } With care of In-Patients.

Physicians... } With care of Out-Patients.

Physician for Diseases of Women and Children and Physician-Accoucheur—Arthur Farre, M.D., F.R.S.

Assistant-Physicians—Charles Murchison, M.D.; Conway Evans, M.B.

Surgeons ... } With care of In-Patients.

Surgeons ... } With care of Out-Patients.

Assistant-Surgeons—John Wood, F.R.C.S.; John W. Hulke, F.R.C.S.

Surgeon-Dentist—S. Cartwright, jun.

The Hospital is visited daily. Clinical Lectures are given every week, both by the Physicians and by the Surgeons. The Physicians' Assistants and Clinical Clerks, the House-Surgeons and dressers, are selected by examination from the Students of the Hospital.

SCHOLARSHIPS.—New Students will have the privilege exclusively of contending, in October, 1859, for five Warneford Scholarships—viz., two of £25 per annum, for three years, and three of £25 per annum, for two years. The Examination will commence on the 29th of September, in Divinity, Classics (subjects the same as for the Matriculation Examination this year at the University of London), Mathematics, History, and the Modern Languages.

One Scholarship of £40, tenable for two years; one of £30, for one year; and three of £20 each, for one year, will be filled up in April next, the subjects of the Examination being exclusively Medical.

Further particulars may be obtained from J. Harley, Esq., Sub-Dean of the Department; and a detailed Prospectus will be forwarded by application to J. W. Cunningham, Esq., Secretary.

R. W. JELF, D.D., Principal.

St. Thomas's Medical Session.—

A GENERAL INTRODUCTORY ADDRESS will be delivered by Dr. R. DUNDAS THOMSON, on SATURDAY, 1st October, 1859, at Three o'clock p.m., after which the Distribution of Prizes, &c. will take place.

Gentlemen have the option of paying £40 for the first year, a similar sum for the second, and £10 for each succeeding year; or £90 at one payment, as perpetual.

PRIZES AND APPOINTMENTS FOR 1859-60.

Voluntary Matriculation Examinations are held early in October, and Prizes are given in each of the three following divisions:—

1st. In Mathematics, Classics, and Ancient History. The President's Prize of 20 Guineas.

2nd. In Physics and Natural History. A College Prize of £20.

3rd. In Modern Languages and Modern History. A College Prize of £20.

To the three most distinguished Pupils for General Proficiency in each year, the following Prizes are awarded:—

FIRST YEAR'S STUDENTS.

1st. The Treasurer's Prize of 30 Guineas. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

SECOND YEAR'S STUDENTS.

1st. A College Prize of £30. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

The Dressers and the Clinical Clerks are awarded to merit, after examination.

THIRD YEAR'S STUDENTS.

1st. A College Prize of £30. 2nd. A College Prize of £20. 3rd. A College Prize of £10.

Clinical Assistants, a Prize of £10, and £5 to the two most meritorious.

Mr. Geo. Vaughan's Cheselden Medal. The Treasurer's Gold Medal.

Mr. Newman Smith's Prize of £5 for the best Essay on "Neuralgia."

The two House-Surgeons, the Resident Accoucheurs, and the Dressers, are periodically selected, and are provided with rooms and commons in the Hospital, free of expense.

A Hospital Registrar, at an annual salary of £80.

Students of each year are classed according to their respective total merits in the examinations, and all of the First Class receive Certificates of Honour.

MEDICAL OFFICERS.—Dr. Roots, Consulting Physician; Mr. Green, Consulting Surgeon; Dr. Barker, Dr. J. Risdon Bennett, Dr. Gooldeen, Mr. South, Mr. Mackmurdo, Mr. Solly, Mr. Le Gros Clark, Mr. Simon, Dr. Peacock, Dr. Bristowe, Dr. Waller, Mr. Whitfield.

Clinical Instruction is given at stated times by the Medical and Surgical Officers; and a systematic Course of Medical Clinical Lectures, by Dr. Barker. Ophthalmic Surgery, Mr. Mackmurdo; Midwifery, Dr. Waller and Mr. H. Gervis; Dental Surgery, Mr. Patient; Medical Tutor, E. Clapton, M.D.

Lecturers on Clinical Medicine—Dr. Barker. Medicine—Dr. J. Risdon Bennett. Surgery—Mr. South. Physiology—Mr. Grainger and Dr. Brinton.

Descriptive and Surgical Anatomy—Mr. Le Gros Clark and Mr. S. Jones.

Chemistry and Practical Chemistry—Dr. R. Dundas Thomson. Midwifery—Dr. Waller. Practical Midwifery—Mr. H. Gervis. General Pathology—Mr. Simon. Botany—Dr. Bristowe. Comparative Anatomy—Mr. W. M. Ord. Materia Medica—Dr. Peacock. Forensic Medicine—Dr. Brinton. Public Health—Dr. Headlam Greenhow. Anatomical Demonstrations—Mr. Rainey and Mr. W. M. Ord. Demonstrations Morbid Anatomy—Dr. Bristowe and Mr. S. Jones. Microscopical Anatomy—Mr. Rainey.

Students can reside with some of the Officers close to the Hospital.

The Patients are admitted daily at Half-past Nine a.m., and the Out-Patients seen at the same time.

To enter, or to obtain Prospectuses and further information, apply to Mr. Whitfield, Medical Secretary, resident at the Hospital.

Anderson's University, Glasgow.—

LECTURES on the following Branches of Medical Science will be delivered during the WINTER SESSION, commencing on TUESDAY, November 1st.

Chemistry	10 a.m.	} Dr. Penny.
Practical Chemistry	11 a.m.	
Midwifery	11 a.m.	} Dr. Paterson.
Institutes of Medicine	12 Noon	
Anatomy, Demonstrative & Surgical	1 p.m.	} Dr. Eben Watson.
Anatomy, Descriptive & Physiological	5 p.m.	
†Practical Anatomy	Daily.	} Dr. George Buchanan.
Surgery	2 p.m.	
Practice of Medicine	3 p.m.	} Dr. Hunter.
Materia Medica, Pharmacy & Dietetics	4 p.m.	
Military Surgery	5 p.m.	} Dr. Andrew Anderson.
Botany	In Summer.	
Medical Jurisprudence	In Summer.	} Dr. Morton.
		} Dr. McLeod.
		} Dr. Bell.
		} Dr. Cowan.

Royal Infirmary, Visit at 8½ a.m. Clinical Lecture at 9 a.m.
Fee, for each Class, £2 2s.—Perpetual, £3 3s. Both Classes of Anatomy, £4 4s.—Perpetual, in advance, £8 8s. The Fees, admitting to all Classes required for Diploma, amount to £30.

Courses of Botany, Anatomy, Practical Chemistry, Medical Jurisprudence, and Midwifery, are delivered in Summer.

Certificates of Attendance on the above Courses are received by the Universities of Oxford, Cambridge, London, Aberdeen, and St. Andrews; by all the Royal Colleges of Surgeons in Great Britain and Ireland; by the Faculty of Physicians and Surgeons of Glasgow, and by the Army, Navy, and East India Boards, and the Apothecaries' Company.

THE UNIVERSITY MUSEUM, a splendid Collection of Specimens of Natural History, including more particularly those of Zoology, Geology, Mineralogy, and Antiquities, is open to all Students attending the University. A valuable Medical Library is also attached to the Medical School.

†The Dissecting Room is free to those attending both Courses of Anatomy during the first and second Sessions, and attached to it there is a Reading Room and Museum for the use of the Anatomical Students. To those who join only one Class of Anatomy, the Dissecting Room Fee is £1 1s.

The extensive Laboratory of the Institution, fitted up expressly for Gentlemen desirous of pursuing Practical and Analytical Chemistry, is open daily from 11 till 3 o'clock. No charge for Apparatus and Materials in the Class for Practical Medical Chemistry.

The Materia Medica Museum contains a valuable Collection of Plates and Specimens, to which additions are constantly being made.

Hospitals. Lying-in Hospital, £1 1s. for Six Months; Eye Infirmary, £2 2s. for Six Months; Royal Infirmary, £10 10s. perpetual, including Medical and Surgical Clinical Lectures, which are delivered four times weekly. The Patients admitted to the Eye Infirmary average 900 annually; those admitted to the Royal Infirmary, 4,000, besides 10,000 out-patients treated at the Dispensary. Average number of Surgical Operations, 200 annually.

Gentlemen attending the Botany Class have Free Admission to the Botanic Garden.

A syllabus of the Lectures and other particulars may be obtained from the Secretary, ANDREW ANDERSON, M.D., 2, Woodside Crescent.

Liverpool Royal Infirmary School of

MEDICINE.

SESSION OF 1859-60.

The INTRODUCTORY ADDRESS will be delivered by Dr. COLLINGWOOD, on October 1, at Two, p.m., after which the PRIZES awarded during the last Session will be distributed.

LECTURES—WINTER SESSION.

Principles and Practice of Surgery—Mr. Long.
Principles and Practice of Medicine—Dr. Inman.
Anatomy and Physiology } Mr. Fletcher and
Pathology, Descriptive and Surgical Anatomy } Mr. Waters.
Chemistry and Pharmacy—Dr. Edwards.

The Dissecting Room is Open Daily, from Eight, a.m. to Six, p.m.

SUMMER SESSION.

Midwifery and Diseases of Women—Mr. Batty.
Diseases of Children—Mr. Grimsdale.
Materia Medica and Therapeutics—Dr. Nevins.
Medical Jurisprudence—Dr. Cameron.
Toxicology—Dr. Edwards.
Botany—Dr. Collingwood.
Ophthalmic Medicine and Surgery—Dr. H. Taylor.
Practical Chemistry—Dr. Edwards.
Pathological Anatomy—Dr. Broadbent.

In addition to the Prizes in each Class, the following EXHIBITIONS are offered for competition annually:—

ROYAL INFIRMARY MEDICAL SCHOLARSHIP, value £42, consisting of a Gold Medal and Six Months' free Board and Residence, with Dressership and Clerkship, in the Royal Infirmary. Should the Scholarship be gained by a Resident Pupil of the Infirmary, Six Months' Payment (£31 10s.) will be returned to him.

FOUR EXHIBITIONS, value £31 10s. each, consisting of free Board and Residence in the Royal Infirmary for Six Months, with Dressership on award of the Medical Board.

For further particulars apply to Mr. Fletcher, 13, Mornington-terrace, Liverpool.

Mr. Power and Dr. Power continue their

LECTURES and EXAMINATIONS daily for the College, Hall, Universities, Army, Navy, and India Board.

The Special Class for the October Examination for M.D. at St. Andrews, is now going on.

The Special Class for the January Examination, at the India Board will commence on Thursday September 22.

Mr. Power prepares Practitioners for the M.D. by correspondence.

Dr. Power receives two House Pupils.

Lecture-room, Exeter-hall, Strand.

September 15, 1859.

Grosvenor Place School of Medicine.

No. 1, GROSVENOR PLACE (Adjoining St. George's Hospital).

WINTER SESSION, 1859-60.

LECTURES.

The INTRODUCTORY LECTURE will be delivered on MONDAY, OCTOBER 3rd, at Three o'clock, p.m., by Dr. COCKLE.

General Anatomy and Physiology—Dr. Richardson.

Descriptive and Surgical Anatomy—Dr. Halford and Mr. Lawson.

Practical Anatomy—Mr. Pittard.

Chemistry—Dr. Thudichum.

Principles and Practice of Medicine—Drs. Cockle and Leared.

Principles and Practice of Surgery—Mr. Spencer Wells & Mr. Adams.

FEES.—General Fee to all the Lectures required by the Universities of London and St. Andrews, the Royal College of Surgeons of England, and the Society of Apothecaries, 35 Guineas.

Special arrangements may be made for any one of the Examining Boards.

Prizes and Honorary Certificates will be awarded for general proficiency at the termination of the Session.

The Microscope is used to illustrate the Lectures and Demonstrations.

The Dissecting Room and Museum of Anatomy are open to the Students during day-light, where their Studies are superintended by the Lecturers on Anatomy and Mr. Pittard.

The Lecturer on Chemistry has a Private Laboratory, where Students are instructed in Analytical and Physiological Chemistry.

Instruction in Pathological Anatomy is given by the Lecturer on Physiology.

Further information may be obtained at the School, 1, Grosvenor-place; of Dr. Richardson, 12, Hinde-street, Manchester-square, W.; or at the Residences of the different Lecturers.

London Hospital Medical and Surgical

COLLEGE, Mile-end.—1859-60.—The next WINTER SESSION will commence on MONDAY, October 3, 1859, when the INTRODUCTORY LECTURE will be delivered by Mr. CRITCHETT, at Three p.m.

Nicholas Parker, M.D.—Medicine.

Thos. Blizard Curling, F.R.S., George Critchett—Surgery.

John Adams—Descriptive and Surgical Anatomy.

Andrew Clark, M.D.—Physiology and General and Morbid Anatomy.

Practical Histology.

John Sharman, John Couper—Practical Anatomy.

Henry Letheby, M.B. Lond.—Chemistry; Practical Chemistry.

H. J. Barrett—Anatomy and Pathology of the Teeth and Dental Surgery.

F. H. Ramsbotham, M.D.—Midwifery and Diseases of Women and Children.

F. H. Ramsbotham, M.D., Henry Letheby, M.B. Lond.—Forensic Medicine.

Herbert Davies, M.D.—Materia Medica and General Therapeutics.

George Critchett—Ophthalmic Surgery.

Robert Bentley, F.L.S.—Botany.

J. Langdon H. Down, M.B.—Comparative Anatomy.

General Fee for attendance on the Medical and Surgical Practice, qualifying for the examinations at the London University, Royal College of Surgeons, and Apothecaries' Hall, and for perpetual attendance on all the Lectures—84 guineas, payable in two instalments of 42 guineas each, at the commencement of the two first Winter Sessions of attendance.

Perpetual Fee to the Lectures alone, £50.

Students can make special entries to Lectures or Hospital Practice.

Further particulars and prospectuses can be had on application to Dr. Parker, Hon. Secretary, 22, Finsbury-square, E.C.; or at the College.

Westminster Hospital School of

MEDICINE.

The INTRODUCTORY ADDRESS of the Session 1859-60 will be delivered by Dr. RUSSELL REYNOLDS, on MONDAY, the 3rd of October, at 8 p.m.; and after the Address a CONVERSATION will be held, and the PRIZES of the past Session distributed.

The Westminster Hospital was Instituted A.D. 1719, and Incorporated by Act of Parliament A.D. 1836. It contains 175 Beds, and affords relief to about 20,000 Out-patients annually.

HOSPITAL PRACTICE.

Physicians—Dr. Basham, Dr. Fincham, Dr. Radcliffe.

Assistant-Physicians—Dr. Marcet, Dr. Reynolds.

Surgeons—Mr. Barnard Holt, Mr. Brooke, Mr. Holthouse.

Assistant-Surgeons—Mr. Hillman, Mr. Power.

Surgeon-Dentist—Mr. Clendon.

LECTURES.

Descriptive and Surgical Anatomy—Mr. Holthouse.

Practical Anatomy—Mr. Heath and Mr. Gray.

Dental Surgery—Mr. Clendon.

Chemistry—Dr. Marcet, F.R.S.

Surgery—Mr. Barnard Holt, and Mr. Brooke, M.A. F.R.S.

Physiology and Physiological Anatomy—Mr. Power.

Medicine—Dr. Basham.

Botany—Mr. Syme, F.L.S.

Comparative Anatomy and Zoology—Mr. Power.

Natural Philosophy—Mr. Brooke, M.A. F.R.S.

Materia Medica and Therapeutics—Dr. Radcliffe.

Forensic Medicine—Dr. Fincham and Dr. Reynolds.

Practical Chemistry—Dr. Marcet, F.R.S.

Midwifery—Dr. Frederic Bird.

Clinical Lectures.—In addition to the instruction given by all the Medical Officers during their visits, Courses of Lectures on Clinical Medicine and Surgery, in accordance with the new regulations of the Examining Boards, will be delivered during the Winter and Summer Terms by the Physicians and Surgeons.

Clinical Assistants, Physicians' Clerks, and Surgeons' Dressers, are selected from the most qualified Students, without additional Fee.

The Entire Course of Study (including Hospital Practice and Lectures) required by the College of Surgeons and the Society of Apothecaries, may be attended on payment of Seventy Guineas.

Further information may be obtained on application to

F. J. WILSON, Secretary to the Hospital.

Leeds School of Medicine.—Twenty-

NINTH SESSION, 1859-60.—The WINTER SESSION will commence on MONDAY, OCTOBER 3, 1859, when W. N. PRICE, Esq., President, will deliver the INTRODUCTORY LECTURE, at Twelve o'clock.

Physiology, General Anatomy, and Pathology, by Mr. Ikin, and Mr. C. G. Wheelhouse.

Anatomy, by Mr. Wm. Nicholson Price, and Mr. T. Pridgin Teale, jun.

Principles and Practice of Surgery, by Mr. Nunneley and Mr. S. Hey.

Chemistry, by Mr. Morley and Mr. Scattergood.

Principles and Practice of Physic, by Dr. Chadwick and Dr. Heaton.

Demonstrators, Mr. T. P. Teale, jun., and Mr. Hall.

SUMMER SESSION, 1860, Commencing May 1.

Materia Medica and Therapeutics, by Mr. Bishop.

Midwifery and Diseases of Women and Children, by Mr. Smith and Mr. Braithwaite.

Forensic Medicine and Toxicology, by Dr. Pyemont Smith.

Botany, by Mr. Wm. Hall.

Practical Chemistry, by Mr. Scattergood.

Operative Surgery, by Mr. Nunneley and Mr. Samuel Hey.

Fee to all the Courses required by the Examining Bodies, except Practical Chemistry, £42; ditto, ditto, for Library and Reading-room, £1.

Application for Tickets may be made to the Treasurer, Mr. Samuel Hey, Albion-place.

REGISTRAR—DR. PYEMONT SMITH.

Clinical Instruction, in conformity with the regulations of the College and Hall, will be given at the General Infirmary; in Medical Cases by Dr. Chadwick and Dr. Heaton; and in Surgical Cases by Mr. Smith, Mr. T. P. Teale, and Mr. Samuel Hey.

CLINICAL CLERKSHIPS AND DRESSERSHIPS.—Three Clinical Clerkships and Dresserships are at the disposal of the Physicians and Surgeons to the General Infirmary, and are gratuitous.

Clinical Lectures are also given on Ophthalmic and Aural Practice, at the Eye and Ear Infirmary, by Mr. Nunneley.

University of Durham.—College of

MEDICINE, NEWCASTLE-UPON-TYNE.—SESSION, 1859-60.

Licentiates and Graduates of the University of Durham are entitled under "The Medical Act," to register as Duly Qualified Practitioners in Medicine.

The WINTER SESSION will commence on MONDAY, October 3, at Two p.m., when the Warden of the University will preside, and present the University Exhibitions and the Prizes to the successful candidates.

The INAUGURAL ADDRESS will be delivered by Dr. GIBSON.

WINTER SESSION.—Commencing October 3, 1859.

Structural Anatomy and Physiology—Dr. Embleton and Dr. Wilson.

Descriptive Anatomy and Demonstrations—Dr. McNay.

Principles and Practice of Physic—Dr. Charlton and Dr. G. Robinson.

Mental Diseases—Dr. G. Robinson.

Principles and Practice of Surgery—Dr. Heath.

Principles of Chemistry—Dr. Richardson and Mr. Browell.

SUMMER SESSION.—Commencing May 1, 1860.

Midwifery and the Diseases of Women and Children—Dr. Frost, Dr. Dawson, and Dr. Gibson.

Botany and Vegetable Physiology—Mr. Sanderson and Mr. Thornhill.

Medical Jurisprudence—Dr. W. Robinson and Mr. Chater.

Materia Medica and Therapeutics—Dr. Humble.

Practical Chemistry—Dr. Richardson and Mr. Browell.

Operative Surgery—Dr. Heath.

Military Surgery—Sir John Fife.

Pathological Anatomy—Dr. Fenwick and Dr. Gibb.

Medical Ethics—Dr. Greenhow.

Perpetual Fee to all the Lectures, Forty-four Guineas.

The Newcastle Infirmary contains 230 beds, and is duly recognised.

D. EMBLETON, M.D., Registrar.
T. F. McNAY, M.D., Secretary.

Liverpool Southern Hospital.

Physician—Dr. Cameron.

Consulting Surgeons—Mr. Churton, Mr. Petrie, and Mr. Minshall.

Surgeons—Mr. Nottingham, Mr. Hamilton, and Mr. Higginson.

House-Surgeon—Mr. John M. Bateson.

Junior House-Surgeon—Mr. Clarence Pemberton.

Terms for Hospital Attendance—Six months, £9 9s.; one year, £12 12s.; unlimited, £31 10s.

The Hospital contains 120 beds, and is chiefly devoted to the reception of acute diseases and severe accidents.

Clinical Lectures delivered by the Physician and Surgeons.

City of London Hospital for Diseases

OF THE CHEST, VICTORIA-PARK.

CONSULTING PHYSICIANS.

B. G. Babington, Esq., M.D., F.R.S. 31, George-street, Hanover-square.

Henry Jeaffreson, Esq., M.D., 2, Finsbury-square.

CONSULTING SURGEON.

John Hilton, Esq., F.R.S., 10, New Broad-street.

PHYSICIANS.

Thomas B. Peacock, Esq., M.D., 20, Finsbury-circus.

James Risdon Bennett, Esq., M.D., 15, Finsbury-square.

Edmund Lloyd Birkett, Esq., M.D., 48, Russell-square.

ASSISTANT PHYSICIAN.

George Nelson Edwards, Esq., M.D., 1, Finsbury-square.

RESIDENT MEDICAL OFFICER.

J. Ward Cousins, Esq., M.B.

The Hospital contains 72 Beds, which are occupied by patients as applications occur. During last year 314 patients were under treatment in the wards, and 6925 persons were relieved as Out-patients.

In-patients admitted since the wards were opened in July, 1855, 1110.

Out-patients admitted since the establishment of the Institution in 1845, 52,650. Information respecting Medical instruction at the Hospital, may be obtained on application to the Physicians.

Offices, 6, Liverpool-street, E.C.

St. George's Hospital Medical School.

SESSION 1859-60.—The WINTER COURSE of INSTRUCTION will commence on SATURDAY, October 1st, with an INTRODUCTORY ADDRESS by Mr. H. C. JOHNSON, at 2 p.m., at the Hospital.

Physicians—Dr. Page, Dr. Bence Jones, F.R.S., Dr. Pitman, and Dr. Fuller.

Assistant-Physicians—Dr. Barclay and Dr. John W. Ogle.

Obstetric Physician—Dr. Robert Lee, F.R.S.

Surgeons—Mr. Caesar Hawkins, F.R.S., Mr. Cutler, Mr. Tatum, and Mr. H. C. Johnson.

Assistant-Surgeons—Mr. Prescott Hewett and Mr. George D. Pollock.

Dentist—Mr. Vasey.

Lecturers—Medicine—Dr. Pitman.

" Surgery—Mr. Tatum.

" Anatomy—Mr. Pollock and Mr. Gray.

" Physiology—Mr. A. Johnson.

" Chymistry—Dr. H. M. Noad.

The Hospital contains 350 beds.

Clinical Lectures are given by the Physicians and Surgeons of the Hospital during the Winter and Summer Sessions, and Clinical Instruction is given in the Wards by the Physicians and Surgeons, and on the Diseases peculiar to Women by the Obstetric Physician.

A Maternity Department, for the delivery of married lying-in women at their own homes, is established at the Hospital, under the superintendence of the Obstetric Physician.

The Surgeons' Perpetual Pupils are eligible to be Assistant House-Surgeon for Six Months, and House-Surgeon for Twelve Months (without additional Fee), when properly qualified for the office. Pupils of the Hospital are eligible to the office of Obstetric-Assistant, when duly qualified, at a salary of £100 per annum.

Pupils entering to St. George's Hospital Medical School are free to all Lectures and Hospital Practice necessary for the Examination of the College of Surgeons and Society of Apothecaries, by the payment of FORTY GUINEAS the first year, FORTY GUINEAS the second year, and TWELVE GUINEAS the third year. But Pupils have the option of entering to the different courses of Lectures and Hospital Practice by separate payments.

EXHIBITIONS AND PRIZES.

"The William Brown Exhibition," of Forty Pounds per Annum, tenable for Three Years, may be held by any Pupil, perpetual to the Medical or Surgical Practice, who has commenced his third, but not completed his fourth Winter Session. Pupils entering to the Hospital Medical School in the Session 1859-60 will be entitled to compete for this Exhibition.

A Prize of Twenty Guineas, for general proficiency in Medical Studies, will be offered to Students who enter to the Hospital Medical School for the Session 1859-60. The Examination will take place in July.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Also, for the encouragement of Clinical Study—

University of Durham.—College of

MEDICINE, NEWCASTLE-UPON-TYNE.—SESSION 1859-60.

The Lectures are open to all Students, whether they intend to Matriculate at the University of Durham, or the University of London, or pass the Examinations of the Royal College of Surgeons, or the Society of Apothecaries.

Students of this College who Matriculate at the University of Durham are enabled to proceed in the first place to a Licence in Medicine, and then to the Degrees of Bachelor and Doctor of Medicine.

The Course required is as follows:—They must reside for one Academical year in the University of Durham, attend to Lectures similar those given to Students in Arts in their first year, and at the end of the year pass an Examination in the Rudiments of Religion, Literature, and Science.

Students in Medicine who have thus passed their first Examination at Durham, pursue their studies for three years in the College of Medicine at Newcastle, and then, preparatory to obtaining a Licence in Medicine, pass at Durham and at Newcastle the final Examinations, which will be directed to the Medical Sciences.

Licentiate in Medicine may proceed to the Degrees of Bachelor and Doctor of Medicine, by writing an Essay, and passing an Examination, upon some proposed Medical subject. Such Licentiate being of the standing of twenty-one Terms from the date of Matriculation for the degree of Bachelor, and of thirty-three terms for the Degree of Doctor of Medicine.

WINTER SESSION.—Commencing October 3, 1859.

Structural Anatomy and Physiology—D. Embleton, M.D., Reader in Medicine in the University of Durham, Physician to the Newcastle Infirmary, and R. H. Wilson, M.D., M.R.C.S.

Descriptive Anatomy—T. F. McNay, M.D., M.R.C.S.

Dissections—T. F. McNay, M.D., M.R.C.S.

Principles and Practice of Physic—Edward Charlton, M.D., Physician to the Newcastle Infirmary, and G. Robinson, M.D., F.R.C.P., Physician to the Newcastle Dispensary.

Mental Diseases—G. Robinson, M.D., Bensham Lunatic Asylum.

Principles and Practice of Surgery—G. Y. Heath, M.D., M.R.C.S., Surgeon to the Newcastle Infirmary, and Eye Infirmary.

Principles of Chemistry—T. Richardson, M.A., Ph.D., and E. J. J. Browell.

SUMMER SESSION.—Commencing May 1, 1860.

Midwifery and the Diseases of Women and Children—S. M. Frost, M.D., M.R.C.S., Senior Accoucheur to the Lying-in Hospital; W. Dawson, M.D.; and C. Gibson, M.D., Physician to the Newcastle Infirmary.

Botany and Vegetable Physiology—R. B. Sanderson, Jun., and J. Thornhill.

Medical Jurisprudence—W. Robinson, M.D., M.R.C.S., and W. Chater, Solicitor.

Materia Medica and Therapeutics—Thomas Humble, M.D., Physician to the Newcastle Infirmary, &c.

Practical Chemistry—T. Richardson, M.A., Ph.D., and E. J. J. Browell.

Operative Surgery—G. Y. Heath, M.D., M.R.C.S., Surgeon to the Newcastle Infirmary and Eye Infirmary.

Military Surgery—Sir John Fife, M.A., Senior Surgeon to the Newcastle Infirmary.

Pathological Anatomy—S. Fenwick, M.D., and C. J. Gibb, M.D., M.R.C.S. Surgeon to the Newcastle Infirmary.

Medical Ethics—T. M. Greenhow, M.D., F.R.C.S., Consulting Surgeon to the Infirmary and Eye Infirmary.

HOSPITAL PRACTICE.

This can be attended at the Newcastle Infirmary, which contains 230 beds, and in which the required Clinical Lectures are delivered.

According to the last Annual Report the number of In-patients was 1573, of Out-patients, 1635, of Casual Patients, 8593—total, 11,301.

Fees.—Twelve Months, Seven Guineas; Six Months, Five Guineas; Three Months, Four Guineas; Perpetual Fee, Seventeen Guineas.

There are two resident and two non-resident Clinical Clerks, to hold office for six months, and to be re-eligible at the expiration of that time. The resident Clerks pay £10 10s. for their board.

Four gratuitous Dresserships are at the disposal of the Surgeons of the Infirmary.

Perpetual Fee to all the Lectures, Forty-four Guineas.

The Laboratories are open daily from Ten a.m. to Five p.m. The Students have every facility for the preparation of all important compounds in Inorganic and Organic Chemistry, and for prosecuting Analyses. They also have an opportunity of gaining a knowledge of the Assaying of Ores, and of the methods of valuing Commercial Products.

Extensive Libraries in the College and Infirmary, and the Museums of Anatomy, Pathology, and Materia Medica, are open daily.

Medical Scholarships in the University of Durham.—The following grace was passed in Convocation of the University, June 17th, 1856:—"Four scholarships of £25 a-year each shall be founded, tenable each for four years by students pursuing their Medical Studies in the University or at Newcastle, and not of sufficient standing to proceed to a Licence in Medicine." A Scholarship will be awarded in October next at Durham.

Students who are members of the University of Durham are eligible to other Scholarships in the University.

D. EMBLETON, M.D., Registrar.

T. F. McNAY, M.D., Secretary.

Newcastle-upon-Tyne, Aug. 22, 1859.

Royal Veterinary College, Great

College-Street, Camden Town, London. Patrons, Her Majesty the Queen, H.R.H. the Prince Consort. President, H.R.H. the Duke of Cambridge, K.G. The Lectures for the ensuing Sessions will commence at the above Institution on MONDAY, October 3rd, 1859. The INTRODUCTORY ADDRESS will be delivered by Professor Simonds, at 12 o'clock. Anatomy, Physiology, and Pathology of the Horse, Professor Spooner. Anatomy, Physiology, and Pathology of other domesticated Animals, Professor Simonds. Chemistry and Materia Medica, Professor Morton. Descriptive Anatomy and Physiology, Assistant Professor Varnall. Anatomical Demonstrations, Mr. Good. Perpetual Fee to all the Lectures, with Infirmary Practice, Clinical Instructions and Anatomical Demonstrations, Twenty-five Guineas.

Sept. 8th, 1859.

CHARLES SPOONER, Principal.

N.B. A Prospectus of the Course of Study necessary to qualify a Pupil for examination for the Diploma of the Royal College of Veterinary Surgeons will be forwarded on application.

Surgeons' Hall, Edinburgh.—Winter

SESSION, 1859-60. The following COURSES of LECTURES on MEDICAL and SURGICAL SCIENCE, and also those delivered in the University, qualify for Examination for the Diploma of the Royal College of Surgeons. All the Courses are for Six Months, if not otherwise specified.

CLASSES OPEN ON THURSDAY, NOVEMBER 3.

Materia Medica and Dietetics 9 a.m. Dr. Douglas MacLagan.
Surgery 10 a.m. Mr. Spence.
Surgery (4, High School-yards) 10 a.m. Mr. Lister.
Surgery (8, Infirmary-street) 10 a.m. Dr. P. H. Watson.
Surgery (5, High School-yards) 10 a.m. Mr. A. M. Edwards.
Chemistry 10 a.m. Dr. Stevenson Macadam.
Analytical Chemistry }
Practical Chemistry } 9 a.m. till 4 p.m. Dr. Stevenson Macadam.
(Three Months' Course)
Physiology 11 a.m. Dr. Sanders.
Medical Jurisprudence (Course 2 p.m. Dr. Littlejohn.
commences on December 1).....

Clinical Medicine (Royal Infirmary) 1 p.m. { Drs. Keiller (Diseases of Women); W. T. Gairdner, and Warburton Begbie.

Clinical Surgery (Royal Infirmary) .. 12 noon Mr. Spence.
Anatomy 2 p.m.
Anatomical Demonstrations 4 p.m. Dr. John Struthers.
Practical Anatomy 9 a.m. till 4 p.m.
General Pathology 4 p.m. Dr. Rutherford Haldane.
Pathological Anatomy (Saturdays) .. 11 a.m. Dr. Rutherford Haldane.
Practice of Physic 3 p.m. Dr. W. T. Gairdner.
Practice of Physic (4, High School-yards) 3 p.m. Dr. Warburton Begbie.

By Order of the Royal College, JOHN SCOTT, Secretary.

The INTRODUCTORY ADDRESS will be delivered by Dr. SKAE, on WEDNESDAY, November 2, at two o'clock.

Diseases of Children Dr. Keiller.
Natural Philosophy 12 noon W. Lees, A.M.
Dental Surgery Royal Public Dispensary Dr. John Smith.

PRACTICAL INSTRUCTION.—Royal Infirmary; 12 till 2 p.m.; Perpetual Ticket, at one payment, £10; Annual, £5 5s.; Half-yearly, £3 3s.; Separate payments for two years and a-half entitle the Student to a Perpetual Ticket. Dispensary Visit—Royal Public Dispensary, and New Town Dispensary, each, Six Months, £3 3s. Practical Midwifery—Royal Maternity Hospital, Royal Public Dispensary, New Town Dispensary, Ticket, £1 8s. Practical Pharmacy—Royal Public Dispensary, New Town Dispensary, Six Months, £3 3s.

FEES.—For the First of each of the above Courses, £3 5s.; For the Second, £2 4s.; Perpetual, £5 5s. To those who have already attended a First Course in Edinburgh, the Perpetual Fee for that Class is £2 4s. The Fees for the following Courses are,—Natural Philosophy, £2 2s.; Practical Chemistry and Practical Anatomy, £3 3s.; Anatomical Demonstrations, £2 2s.; Practical Anatomy with Demonstrations, £4 4s.; Analytical Chemistry, £2 a Month, or £10 for the Winter Session; Dental Surgery, Six Months, £2 2s. When qualifying for the University of Edinburgh, the Fee, to be paid when the Ticket is taken out, for any of the above Classes, is the same as that for the corresponding Class in the University.

During the SUMMER SESSION, 1860, the following Three Month's Courses will be delivered:—

Midwifery—Dr. Keiller.
Midwifery (4, High School-yards)—Dr. J. Matthews Duncan.
Medical Jurisprudence—Dr. Littlejohn.
Clinical Surgery—Mr. Spence
Clinical Medicine—{ Drs. Keiller,
 { W. T. Gairdner, and
 { Warburton Begbie.
Practical and Analytical Chemistry—Dr. Stevenson Macadam.
Practical and Comparative Anatomy—{ Dr. John Struthers.
Diseases of the Eye—
Pathological Anatomy—Dr. Rutherford Haldane.
Natural Philosophy—W. Lees, A.M.
Histology—Dr. Sanders.
Insanity—Dr. Skae.
History of Medicine—Dr. Warburton Begbie.
Diseases of the Eye—Mr. Walker.
Dental Surgery—Dr. John Smith.
Venereal Diseases—Dr. P. H. Watson.
Surgical Pathology and Operative Surgery—Mr. Lister.

JOHN STRUTHERS,

Secretary to the Medical and Surgical School.

The Middlesex Hospital.—Session

1859-60.—The Session opens on MONDAY, October 3rd, with an Introductory Address by Mr. HENRY, at Eight o'clock, p.m.

The Hospital contains upwards of 300 beds, of which 185 are for Surgical, and 120 for Medical cases. 2109 In-patients were admitted during the past year; the number of Out-patients during the same period amounted to 16,469.

General Fee for attendance on the Hospital Practice and Lectures required by the College of Surgeons and Apothecaries' Company, £81. This sum may be paid by instalments of £35 at the beginning of the first session, £35 at the beginning of the second session, and £11 at the beginning of the third session. For every additional session, £10.

This fee admits the Students to the Practical Chemistry course, and to all other Lectures delivered in the College except Comparative Anatomy.

All Students on entering will be required to sign an undertaking to conform to the laws relating to the discipline of the Hospital and College.

T. W. NUNN, Dean.

Mr. Edwards will commence his

Lectures on the PRINCIPLES AND PRACTICE OF SURGERY, at No. 5, High School-yards, on FRIDAY, November 4, at 10 o'clock a.m. Edinburgh, September, 1859.

Queen's University in Ireland.—

QUEEN'S COLLEGE, GALWAY.—SESSION 1859-60.

FACULTY OF MEDICINE.

Dean of the Faculty—CHARLES CROKER KING, M.D., F.R.C.S.I., M.R.I.A.

PROFESSORS.

Anatomy and Physiology—Charles C. King, M.D., F.R.C.S.I., M.R.I.A.

Practice of Medicine—Nicholas Colahan, M.D.

Practice of Surgery—James V. Browne, M.D., L.R.C.S.I.

Materia Medica—Simon M'Coy, F.R.C.S.I.

Midwifery and Diseases of Women and Children—Richard Doherty, M.D., V.P. Dublin Obstetrical Society.

Medical Jurisprudence—Simon M'Coy, F.R.C.S.I.

Modern Languages—Augustus Bensbach, M.D.

Natural Philosophy—Arthur H. Curtis, A.M.

Chemistry—Thomas H. Rowney, Ph.D.

Natural History—Alexander G. Meville, M.D. Edinburgh, M.R.C.S. England, M.R.I.A.

Logic and Metaphysics—Thomas W. Moffett, LL.D.

Demonstrator of Anatomy—Robert Reid, B.A. M.R.C.S.E.

The Matriculation Examinations in the Faculty of Medicine will commence on Tuesday, October 18.

Additional Matriculation Examinations will be held on Thursday, November 24.

Matriculation is necessary for those students only who intend to proceed for the degree of M.D. in the Queen's University, or to become Candidates for Scholarships, Exhibitions, or Prizes in the College.

SCHOLARSHIPS AND EXHIBITIONS.

In the Faculty of Medicine Six Junior Scholarships, of the value of £20 each, and Six Exhibitions of the value of £10 each, are appropriated as follows:—Two Scholarships and two Exhibitions to Students of the first, second, and third years respectively. Also, two Senior Scholarships of the value of £40 each, and two Exhibitions of the value of £18 each, are appropriated to Students of the fourth year.

The Examinations for Scholarships and Exhibitions will commence on Thursday, October 20, and be proceeded with as laid down in the Prospectus.

In addition to the Scholarships and Exhibitions above mentioned, Prizes will be awarded by each Professor at the close of the Session.

Scholars of the first, second, and third years, are exempted from a moiety of the Class Fees.

The Medical School of Queen's College, Galway, affords ample means for the acquisition of Medical and Surgical knowledge.

Museums.—An extensive Museum, illustrative of Anatomy and General Pathology, Materia Medica and Toxicology, has been provided; and to facilitate the study of the Obstetric branch of Medical Science, the College has purchased the Montgomery Museum.

Hospitals.—The Hospitals, to which Students are admitted, contain two hundred beds, and are visited every morning by the Medical Professors, who deliver Clinical Lectures.

In order to induce Medical Students to attend the practice of the Hospitals during the entire course of their education, the fee for Hospital Attendance and Clinical Lectures conjointly, has been reduced to £2 for each Session.

Collateral Sciences.—Laboratories and every requisite appliance exist for the cultivation of Chemistry and Natural Philosophy. The College is furnished with a Museum of Natural History and a Botanical Garden. Botanical excursions are conducted by the Professor in the proper season.

Further information may be had on application to the Registrar, from whom copies of the Prospectus may be obtained.

By Order of the President,

September 1, 1859. WM. LUPTON, M.A., Registrar.

Charing Cross Hospital Medical

COLLEGE, WEST STRAND, LONDON.

WINTER SESSION, October 1st, 1859, to end of March, 1860.

Anatomy—E. Canton, Esq., F.R.C.S.

Chemistry—R. V. Tuson, F.R.C.S.

Demonstrations and Dissections—T. W. J. Goldsbro, M.D.

Physiology and Pathology—Hyde Salter, M.D., F.R.S.

Medicine—W. D. Chowne, M.D., and W. H. Willshire, M.D.

Surgery—H. Hancock, Esq., F.R.C.S.

SUMMER SESSION, May, 1860, to end of July, 1860,

Materia Medica—J. Staggall, M.D.

Botany—J. Symes, Esq.

Comparative Anatomy—R. Barwell, Esq., F.R.C.S.

Midwifery, &c.—W. D. Chowne, M.D.

Forensic Medicine—G. Birkett, M.D., and F. Hird, Esq., F.R.C.S.

Practical Chemistry in the Laboratory—R. V. Tuson, F.R.C.S.

Fee to Matriculated Students for all the Lectures required by the College of Surgeons and Society of Apothecaries (except Practical Chemistry), £42 2s.

HENRY HANCOCK, Dean of the College.

HOSPITAL PRACTICE.

Consulting Physician—Wm. Shearman, M.D.

Physicians—Dr. Golding and Dr. Chowne.

Assistant-Physicians—Dr. Willshire and Dr. Salter.

Surgeons—Mr. Hancock and Mr. Canton.

Assistant-Surgeons—Mr. Hird and Mr. Barwell.

Medical Practice—Full period required, £18 18s. Surgical, £18 18s.

Both Medical and Surgical practice, full period, £31 10s.

JOHN ROBERTSON, Hon. Sec.

Evening Demonstrations of Anatomy.

—Mr. CHRISTOPHER HEATH, Demonstrator of Anatomy at the Westminster Hospital, will resume his Evening Course of DEMONSTRATIONS and EXAMINATIONS upon the DISSECTED SUBJECT on Wednesday, the 5th of October. The Demonstrations take place on Monday, Wednesday, and Friday evenings, during the Winter Session, from Seven to Nine o'clock, at the Westminster Hospital. Entrance Fee perpetual) Five Guineas.

Metropolitan School of Dental Science,

5, CAVENTISH-SQUARE.

This School will open on Wednesday, the 5th day of October, 1859.

The Introductory Lecture will be delivered at Four P.M. by Dr. RICHARDSON.

The Courses will be arranged so as to prepare candidates for the Examination for Membership now enforced by the College of Dentists, as well as for any other examination in Dentistry which may be hereafter instituted.

Dr. B. W. Richardson, L.R.C.P.—Elements of Anatomy, Physiology, and Pathology.

R. T. Hulme, Esq., M.R.C.S. F.L.S.—Dental Surgery.

W. Perkins, Esq.—Dental Mechanics.

T. Spencer Wells, Esq., F.R.C.S.—Principles of Surgery.

Dr. A. J. Bernays—Elements of Chemistry and Metallurgy.

Dr. T. Spencer Cobbold, F.L.S.—Comparative Anatomy.

FEES.

	TO SINGLE COURSES.	£	s.	d.
Anatomy and Physiology, with Demonstrations from the Subject	4	4	0	
Dental Surgery	3	3	0	
Dental Mechanics	3	3	0	
Principles of Surgery	1	11	6	
Chemistry and Metallurgy	1	11	6	
Comparative Anatomy	1	11	6	
Fee to one Complete Course	£10	10	0	
Perpetual Fee	16	16	0	

The above Courses of Lectures are open to the Members of the College of Dentists at half fees.

The College of Dentists of England have granted the following Prizes, to be awarded at the close of the Session 1859-60:—

A Gold Medal for General Proficiency.

A Silver Medal for Proficiency in Operative Dentistry.

A Silver Medal for Proficiency in Mechanical Dentistry.

The Lectures given at this School will be demonstrative and practical, and, with the difference of being adapted to the special wants of the student in Dentistry, will be conducted on the same plan as at the Medical Schools and Universities.

The Course on "Dental Mechanics" will be taught by demonstration.

Practical Anatomy.—Gentlemen who may desire to study Practical Anatomy will be provided, for a small extra fee, with the means for dissection under the superintendence of a Demonstrator, who will be appointed by the Lecturer on Anatomy.

The Microscope will be used to illustrate the Lectures and Demonstrations.

Opportunities will be afforded for Demonstrations in Operative Dentistry and in Dental Pathology.

The hours of lecture will be arranged for the evening.

Prospectuses of the School, and all information, may be obtained on application to the undersigned.

HENRY T. KEMPTON, Honorary Secretary.

S, Princes-street, Hanover-square, W.

University College, London.—Faculty

OF MEDICINE.—The SESSION 1859-60 will open on MONDAY the 3rd October, at 3 o'clock, p.m. A Meeting will be held for the Presentation to Students of the Faculty, of the Medals and Certificates of Honour awarded at the Class Examinations for the Winter and Summer Terms of the last Session. At 8 o'clock p.m. the Professors of the Faculty will receive the Students and their friends at a Conversation, in the General Library and New Museum of the College. Gentlemen who may be disposed to favour the Professors with their company, are requested, if they have not received invitations, to leave their names and addresses in the office of the College, under cover to the Dean, in order that cards may be sent to them.

The Lectures to the Classes of the Winter Term will commence as follows:—

On TUESDAY, October 4.

Anatomy—Professor Ellis, at 9 o'clock, a.m.

Anatomy and Physiology—Professor Sharpey, M.D., at 10 a.m.

Chemistry—Professor Williamson, at 11 a.m.

Comparative Anatomy—Professor Grant, M.D., at 3 p.m.

Surgery—Professor Erichsen, at 4 p.m.

The Principles and Practice of Medicine—Professor Walshe, M.D., at 5 p.m.

On MONDAY, October 17.

Practical Physiology and Histology—Dr. Harley, F.R.C.S., at p.m.

In January—Dental Surgery—Mr. G. A. Ibbetson, at 6 p.m.

Hospital Practice daily throughout the year with Clinical Lectures by the Physicians and Surgeons, also Lectures on Ophthalmic cases. Prospectuses may be obtained at the Office of the College.

A. W. WILLIAMSON, Dean of the Faculty.

CHAS. C. ATKINSON, Secretary to the Council.

September 20, 1859.

University College, London.—

PRACTICAL PHYSIOLOGY and HISTOLOGY. By GEORGE HARLEY, M.D., F.R.C.S. This Course will consist of a Series of Microscopic Demonstrations of the Textures and Fluids of the Body, and of Demonstrations in Experimental Physiology. The Student will be practically instructed in the various methods employed in Microscopical and Physiological Investigation. Demonstrations, Monday and Wednesday, from Four to Five, and every alternate Saturday from Ten to Eleven, a.m., commencing on the 17th October. Fee, £3.

ALEX. WILLIAMSON, F.R.S., Dean of the Faculty of Medicine.

CHARLES C. ATKINSON, Secretary to the Council.

Sept. 10, 1859.

British Lying-in Hospital, Endell- STREET, LONG-ACRE.

RESIDENT PUPILS are received at this Hospital for PRACTICAL INSTRUCTION in MIDWIFERY. Terms, &c. may be known on application to the Secretary at the Hospital.

By Order of the Board,
EDWIN PHILLIPS, Secretary.

Royal College of Surgeons in Ireland.

President—CHRISTOPHER FLEMING.
Vice-President—ROBERT ADAMS.
Secretary of the College—EDWARD HUTTON.

COUNCIL.

Arthur Jacob.	Robert Pentland.
Thomas E. Beatty.	Samuel G. Wilmot.
William Hargrave.	Augustus E. Tabuteau.
Andrew Ellis.	Thomas L. Mackesy.
Robert C. Williams.	Auley P. Banon.
James Barker.	Peter Shannon.
William Colles.	Rawdon Macnamara.
John H. Power.	Hamilton Labatt.
Hans Irvine.	George H. Porter.
Edward Hutton.	

COURT OF EXAMINERS.—Josiah Smyly, R. G. H. Butcher, Richard Tuohill, Thomas Byrne, M. H. Stapleton, B. W. Richardson, Edward A. Stoker.

EXAMINERS IN MIDWIFERY.—William Jameson, Robert Johns, Jerome Morgan.

PROFESSORS.

Anatomy and Physiology—Dr. Arthur Jacob.
Descriptive Anatomy—Dr. J. H. Power and Dr. Bevan.
Surgery—W. H. Porter and W. Hargrave.
Medicine—Dr. C. Benson.
Chemistry—Dr. W. Barker.
Materia Medica—Dr. R. C. Williams.
Midwifery—Dr. Sawyer.
Medical Jurisprudence—Dr. T. G. Geoghegan.
Botany—Dr. A. Mitchell.
Practical Chemistry—Dr. Barker.
Comparative Anatomy—Dr. Jacob.
Military Surgery—Mr. Tufnell.
Logical Science—John Murray, LL.D.

Fellows of the College are members of the Corporation, and are admitted by examination; Letters Testimonial are granted to Licentiates, and a Diploma in Midwifery to Fellows and Licentiates educated and examined in that branch of Surgery.

Candidates for the Fellowship must be twenty-five years of age, and must give proof of liberal preliminary education, and good conduct during professional education. They are required to produce certificates of surgical studies for six years (three of which must be for exercises in Dublin), and also of practice as House-Surgeon or dresser in any Hospital; as well as certificates of attendance on Hospitals, Lectures, and Dissections, as required from Licentiates; with the addition of Botany, Comparative Anatomy, and Natural Philosophy. Fee, £26 5s.; if the Candidate be a Licentiate, £10 10s.

Candidates for Letters Testimonial are required to produce certificates of preliminary classical education, of four years' professional study (three of them in metropolitan schools) also three years' attendance on Hospital Lectures and Dissections. Fee, £21.

Candidates for the Midwifery Diploma must be Fellows or Licentiates of the College, are required to produce certificates of attendance on Midwifery Lectures and practice, with proof of having attended thirty cases of parturition.

Candidates for the Fellowship and Letters Testimonial are publicly examined on two separate days, in Anatomy, Physiology, Surgery, Practice of Medicine, and Pharmacy. The Examiners are elected by a sworn jury of the Council appointed by lot, teachers being ineligible. Fellows and Licentiates of the College are qualified to practise as Surgeons in any part of the British dominions, and to be appointed Medical officers to the Army and Navy, Public Hospitals, Infirmarys, Dispensaries, and Workhouses.

Royal College of Surgeons in Ireland.—

SCHOOL OF SURGERY.—SESSION 1859-60. The DISSECTING ROOMS will be opened on the 3rd of OCTOBER, and the LECTURES will commence on MONDAY, the 31st.

Anatomy and Physiology—Dr. Jacob.
Descriptive Anatomy—Dr. Power and Dr. Bevan.
Surgery—Mr. Porter and Mr. Hargrave.
Practice of Medicine—Dr. Benson.
Chemistry—Dr. Barker.
Materia Medica—Dr. Williams.
Midwifery—Dr. Sawyer.
Medical Jurisprudence—Dr. Geoghegan.
Practical Chemistry—Dr. Barker.
Comparative Anatomy—Dr. Jacob.
Botany—Dr. Mitchell.
Military Surgery—Mr. Tufnell.
Logical Science—John Murray, LL.D.

The Fee for each of the above Courses is Two Guineas, except Comparative Anatomy, which is free, and Military Surgery, which is Three Guineas. Dissections under the direction of the Professors of Anatomy, assisted by the Demonstrators, Messrs. Morgan, Mapother, and Egan.

The SUMMER SESSION will commence in May, and terminate in August.

For further information, application to be made to any of the Professors, or to the Registrar.

By Order, JOHN BRENNEN, Registrar.

City of Dublin Hospital.—The Course

of Practical, Medical, and Surgical Instruction in this Hospital will commence in OCTOBER.

The Clinical Lectures will be delivered on three days in each week during the Session, by Dr. Jacob, Dr. Benson, Mr. Hargrave, Mr. Williams, Dr. Geoghegan, and Mr. Tufnell; and on Diseases peculiar to Women and Children, by Dr. Beatty. Dr. Jacob's Clinical Lectures on Diseases of the Eye, illustrated by the Cases in the Hospital, are open to the Pupils in attendance.

Sir Henry Marsh, Mr. Cusack, Dr. Anjohn, and Mr. Porter, give their assistance in cases requiring consultation.

The Certificates of Attendance are received as Qualification by all the Colleges, Halls, and Boards.

University and King's College,

ABERDEEN.—MEDICAL SCHOOL.

The WINTER SESSION commences on the First Monday of November, and terminates on the Third Friday of April. INTRODUCTORY LECTURES on the First Monday of November, at Two o'clock, p.m.

Subjects.	Lecturers.	Hours.	Fees.
Institutes of Medicine } (Physiology)	Dr. Christie	8 to 9 a.m.	£3 3 0
Anatomical Demonstrations.	Dr. Redfern	12 to 1 p.m.	2 2 0
Chemistry	Dr. Fyfe	10½ to 11½ a.m.	3 5 6
Materia Medica	Dr. Rattra	9 to 10 a.m.	3 3 0
Practice of Medicine	Dr. Williamson	1 to 2 p.m.	3 3 0
Anatomy and Physiology	Dr. Redfern	2 to 3 p.m.	3 3 0
Surgery	Dr. Kerr	3 to 4 p.m.	3 3 0
Midwifery	Dr. Reiny	4 to 5 p.m.	3 3 0

SUMMER SESSION. First Monday in May.

Botany	Rev. Dr. J. C. Brown	8 to 9 a.m.	2 2 0
Practical Chemistry	Dr. Fyfe	12 to 1 p.m.	3 5 6
Anatomical Demonstrations.	Dr. Redfern	2 to 3 p.m.	2 2 0
Medical Jurisprudence	Dr. Reid	3 to 4 p.m.	2 2 0
Histology	Dr. Redfern		
Natural Philosophy	Professor Thomson.		2 2 0
Natural History	Rev. Dr. J. Longmuir		2 2 0

The Rooms for Practical Anatomy are personally superintended by Dr. Redfern.

Students are required to matriculate within the first month of the Winter Session, and within the first fortnight of the Summer Session, and no certificate of attendance will be given without such matriculation. The Matriculation Fee for all the Classes is one sum of 5s. for the Winter, and one of 2s. 6d. for the Summer Session.

Chemistry will be taught, as formerly, in King's College; and the other Classes in the Medical School, St. Paul-street.

ROYAL INFIRMARY.—The Hospital is open daily at 10 o'clock a.m., and contains upwards of 300 beds. Separate Courses on Clinical Medicine and Clinical Surgery are delivered in the Hospital twice a week.

Physicians.—Dr. Dyce, Dr. Kilgour, Dr. W. Williamson, Dr. Nicol.

Surgeons.—Wm. Keith, Esq., Wm. Pirrie, Esq., David Kerr, Esq., Peter Redfern, Esq.

Ophthalmic Surgeon.—John Cadenhead, Esq.

Lecturers on Clinical Medicine and Surgery.—Dr. Kilgour, Wm. Keith, Esq.

Fee for the Medical and Surgical Practice of the Hospital, 1st year, £3 10s.; 2nd year, making perpetual, £3; or one sum of £6.

CLINICAL MEDICINE.—For the First Course, £2 2s.; subsequent Courses, £1 1s. each; perpetual, £4 4s.

CLINICAL SURGERY.—For the First Course, £2 2s.; subsequent Courses, £1 1s. each; perpetual, £4 4s.

DISPENSARY.—The Aberdeen General Dispensary, Vaccine, and Lying-in Institution, is open to the Student on application to the Medical Officers. There are annually about 5000 patients, either prescribed for at the Institution, or visited at their own houses.

LUNATIC ASYLUM.—The Asylum contains about 240 patients. A limited number of Students are admitted to see the Practice. Fee, for a Course of Three Months, £2 2s.

Consulting Physician.—Dr. Macrobain.

Resident Physician and Superintendent.—Dr. Robert Jamieson.

The Library of the University contains about 60,000 volumes, and is free to all the Students of King's College.

The Medico-Chirurgical Society possesses a valuable Medical Library of nearly 4000 volumes, and a Reading Room, to both of which, and to all the privileges of Junior Members, Students are admitted on payment of £1 1s. per year, becoming free members after three payments.

DAVID THOMSON, Secretary.
King's College, Aberdeen, September, 1859.

Government School of Mines and of

SCIENCE APPLIED to the ARTS.

Director—Sir RODERICK IMPEY MURCHISON, D.C.L. M.A. F.R.S. &c.
During the Session 1859-60, which will commence on the 3rd October, the following COURSES OF LECTURES and PRACTICAL DEMONSTRATIONS will be given:—

1. Chemistry—By A. W. Hofmann, LL.D. F.R.S. &c.
2. Metallurgy—By John Percy, M.D. F.R.S.
3. Natural History—By T. H. Huxley, F.R.S.
4. Mineralogy.
5. Mining. } By Warrington W. Smyth, M.A. F.R.S.
6. Geology—By A. C. Ramsay, F.R.S.
7. Applied Mechanics—By Robert Willis, M.A. F.R.S.
8. Physics—By G. G. Stokes, M.A. F.R.S.

Instruction in Mechanical Drawing, by Mr. Binns.

The Fee for matriculated Students (exclusive of the laboratories) is £30, in one sum, on entrance, or two annual payments of £20.

Pupils are received in the Royal College of Chemistry (the laboratory of the School), under the direction of Dr. Hofmann, at a Fee of £10, for the Term of Three Months. The same Fee is charged in the Metallurgical Laboratory, under the direction of Dr. Percy. Tickets to separate Courses of Lectures are issued at £1, £1 10s., and £2 each. Officers in the Queen's Service, Her Majesty's Consuls, acting Mining Agents and Managers, may obtain Tickets at reduced charges.

Certificated Schoolmasters, Pupil-Teachers, and others engaged in Education, are also admitted to the Lectures at Reduced Fees.

His Royal Highness the Prince of Wales has granted two Exhibitions, and others have also been established.

For a Prospectus and Information, apply at the Museum of Practical Geology, Jermyn-street, London.

TRENHAM REEKS, Registrar.

Diseases of the Eye.—Dr. Jacob will

deliver a full Course of Lectures on the ANATOMY, PHYSIOLOGY, and OPTICAL MECHANISM of the EYE, during the ensuing Session, in the COLLEGE of SURGEONS; and also a separate Course on its PATHOLOGY and DISEASES, with the Operations required in their Treatment, in the CITY of DUBLIN HOSPITAL.

Royal Infirmary, Edinburgh.—In this

Hospital a portion of the beds is set apart for Clinical Instruction by the Professors of the University of Edinburgh. Courses of Clinical Medicine and Surgery are also given by the Ordinary Physicians and Surgeons. Special instruction is given in the Medical Department on Diseases of Women, Physical Diagnosis, &c., and in the Surgical Department on Diseases of the Eye. Separate Wards are devoted to Fever, Small-pox, Venereal Diseases, Diseases of Women, Diseases of the Eye; also to cases of incidental Delirium or Insanity. Post-mortem Examinations are conducted in the Anatomical Theatre by the Pathologist, who also gives practical instruction in Pathological Anatomy and Histology.

MEDICAL DEPARTMENT.

Professors of Clinical Medicine—Dr. Bennet and Dr. Laycock.
Extra Physician and Lecturer on Diseases Peculiar to Women—Dr. Simpson.

Extra Physician attached to Dr. Simpson's Ward—Dr. T. G. Weir.
Ordinary Physicians, and Lecturers on Clinical Medicine—Dr. Keiller, (Diseases of Women), Dr. W. T. Gairdner, and Dr. Warburton Begbie.

Special Assistant Physician—Dr. Rutherford Haldane.
Pathologist—Dr. Rutherford Haldane.

SURGICAL DEPARTMENT.

Professor of Clinical Surgery—Mr. Syme.

Consulting Surgeon—Dr. Dunsmuir.

Ordinary Acting Surgeons—Mr. Spence (Lecturer on Clinical Surgery) and Dr. J. D. Gillespie.

Extra Acting Surgeon—Professor Miller.

Ophthalmic Surgeon—Mr. Walker.

Assistant Surgeons—Dr. John Struthers and Mr. Lister.

Hospital Tickets.—Perpetual, in one Payment, £10; Annual, £5 5s.; Half-yearly, £3 3s. Separate Payments for Two years and a Half entitle the Student to a Perpetual Ticket. A Half-yearly Ticket can be obtained only by those Students who have previously had an Annual Ticket of this Hospital.

N.B.—In future no charge will be made for Certificates.

APPOINTMENTS.

No Fees are payable for any Medical or Surgical Appointment in this Hospital. The Subordinate Appointments are made by the Physicians and Surgeons, or, on their recommendation, by the Managers; and they are open to all Students and Junior Practitioners holding the Hospital Ticket during the period over which the Appointment extends. These Appointments are as follows:—

1. Four Resident Physicians and Three Resident Surgeons are from time to time appointed by the Managers, on the recommendation of the Physicians and Surgeons. The holders of these offices live in the House free of charge. Candidates must be legally qualified to practise. The appointment is for six months, but may be renewed at the end of that period by special recommendation.

2. Non-resident Clinical Clerks are appointed by the Physicians and Surgeons, for such periods and under such conditions as they deem expedient.

3. Dresserships. Each Surgeon appoints from Four to Nine Dressers, the appointment being for Six Months.

4. Assistants in the Pathological Department are appointed by the Pathologist.

By Order of the Managers,

PETER BELL, Clerk to the Incorporation.

Edinburgh, September, 1859.

Sheffield Medical Institution.—Session

1859-60.—The INTRODUCTORY LECTURE will be delivered on MONDAY EVENING, October 3rd, at Eight o'Clock, by Dr. BINGLEY.

LECTURES:

WINTER SESSION, commencing October 3rd, 1859.

General Anatomy and Physiology—Mr. Skinner, Mr. Allanson, Dr. Eastwood.

Practical Anatomical, and Demonstration—Mr. H. Walker, Mr. Benson.

Chemistry—Dr. Bingley.

Medicine—Dr. Bartolome, Dr. Charles Smith.

Surgery—Mr. Barber, Mr. W. F. Favell.

SUMMER SESSION, commencing May 1st, 1860.

Midwifery and Diseases of Women and Children—Mr. W. Jackson (Pupils of this Class will be provided with Cases when qualified to attend them).

Materia Medica and Therapeutics—Dr. I. C. Shearman, Dr. Jackson.

Medical Jurisprudence.

Botany—Mr. H. Walker, Mr. Birks.

Practical Chemistry—Dr. Bingley.

CLINICAL LECTURES are given by Dr. BARTOLOME, on his practice at the Infirmary.

CLINICAL LECTURES on SURGERY are given by the Surgeons of the Infirmary.

The Fees for all the Lectures required by the College of Surgeons, and the Society of Apothecaries, will not exceed £42. This, however, is exclusive of the Fee for Practical Chemistry, which must be subject to special arrangement with the Lecturer.

A prospectus and every information may be obtained by addressing to the Honorary Secretary, Mr. Barber, 2, Eyre-street, Sheffield.

The Terms of attendance on the Practice of the Sheffield General Infirmary, and the Sheffield Public Dispensary, may be known on Application to the Officers of those Institutions.

The next Competitive Examination

for ASSISTANT-SURGEONCIES in the ARMY, will take place at No 6, WHITEHALL YARD, on MONDAY, the 3rd October next.

T. ALEXANDER, Director-General.

Army Medical Department, 6, Whitehall Yard, September 21, 1859.

Wines from the Cape of Good Hope.

W. and A. GILBEY'S SOUTH AFRICAN PORT, SHERRY, &c. &c., 20s. per Dozen. First growths only. Two samples for 12 stamps.

Wine Importers and Distillers, 357, Oxford-street, London (W.); 31, Upper Sackville-street, Dublin; and 12, St. Andrew-square, Edinburgh. Medical Reports, Price Lists, &c. sent post free.

The Adelaide Hospital, Peter-street,

DUBLIN.

PHYSICIANS:

James F. Duncan, M.D., F.C.P., Physician to Sir Patrick Dun's Hospital, 19, Gardiner's-place.

Alfred Hudson, M.D., F.C.P., 2, Merrion-square, North.

SURGEONS:

Albert J. Walsh, M.D., F.R.C.S.I., 89, Harcourt-street.

John Morgan, F.R.C.S.I., Senior Demonstrator of Anatomy, Royal College of Surgeons, 19, Ely-place.

John K. Barton, M.B., L.R.C.S.I., Senior Demonstrator of Anatomy, Trinity College, 16, Upper Pembroke-street.

Benjamin Willis Richardson, F.R.C.S.I., Member of the Court of Examiners in the Royal College of Surgeons, and one of the Hon. Secretaries to the Surgical Society of Ireland, 2, North Frederick-street.

This Hospital is now open for Clinical Instruction; and having been recently enlarged by the addition of an extensive Wing, contains 100 beds, of which 30 are devoted to the Special Diseases of Infants and Children.

Clinical Instruction.—Two Medical and Two Surgical Lectures, including Lectures on the Diseases of the Eyes, will be delivered in each week; Beside Instruction being given daily by both the Physicians and Surgeons. Practical Demonstrations in the use of the Stethoscope and Microscope, as applied to the diagnosis of disease, will be given during the Session.

Hours of Attendance.—The Physicians will visit the Hospital daily at Half-past Eight, a.m., the Surgeons at Half-past Nine, a.m., punctually. Operations which admit of delay will be performed on Wednesdays and Saturdays; so far as practicable, notice of all operations taking place at other times will be given to the Students.

Order of Business.—Monday, Lecture (Surgical), at Half-past Nine. Tuesday, Lecture (Medical) at Half-past Eight. Wednesday, Operations. Thursday, Lecture (Surgical) at Half-past Nine. Friday, Lecture (Medical) at Half-past 8. Saturday, Operations.

Dispensary.—There is a numerously-frequented Dispensary attached to the Hospital, which is attended daily by the Physicians and Surgeons, who will instruct the Students in the diagnosis and treatment of the various forms of diseases brought before them. Every facility will be given to the Students for the performance of the minor operations in Surgery.

Fees.—For Nine Months' Hospital Attendance, £8 8s.; For Six Months' Hospital Attendance, £6 6s.; For Summer Three Months' Hospital Attendance, £3 3s.; Perpetual Pupils (paid at entrance), £21.

Prizes.—One Medical and one Surgical Prize will be given at the close of the Session.

Hospital Residence.—A House next door to, and communicating with, the Hospital has been fitted up for the reception of a limited number of Students, who will thus have the combined advantages of a Private and Hospital Residence.

Certificates of Attendance upon this Hospital are fully recognised by the King and Queen's College of Physicians in Ireland; the University of Dublin; the Queen's University in Ireland; the Royal Colleges of Surgeons, England and Ireland; the Army, Navy, and East India Boards, &c.

The central position of the Hospital, and its close proximity to the Schools of the Royal College of Surgeons and the Ledwich School, renders it peculiarly convenient to Students attending those Institutions.

Further particulars can be obtained from Mr. Richardson, Secretary to the Medical Board, 2, North Frederick-street; or any of the other Physicians or Surgeons.

Examinations for the Double

QUALIFICATION OF LICENTATE in MEDICINE and LICENTATE in SURGERY, to be conferred by the ROYAL COLLEGE of PHYSICIANS of EDINBURGH, and the ROYAL COLLEGE of SURGEONS of EDINBURGH, conjointly.

The ROYAL COLLEGES of PHYSICIANS and SURGEONS of EDINBURGH, while they still continue to give their DIPLOMAS SEPARATELY, under separate Regulations, have made arrangements (in terms of the Medical Act), which have been submitted to, and have received the sanction of, the General Medical Council, whereby, after one Series of Examinations, the Student may obtain Two Licences, one in Medicine and one in Surgery.

The object of the joint Examinations is to give to Students facilities for obtaining from two separate Bodies, and at less expense, a Double Qualification in Medicine and in Surgery, and thus to enable them to hold various important public appointments, for which, if they only possessed a single qualification, they would be ineligible. Students passing these Examinations successfully will be enabled to enter their names in the Register as L.R.C.P. Ed. and L.R.C.S. Ed.

The Colleges have prepared a Code of Regulations to be observed by Candidates for the Double Qualification, both as regards General and Professional Education and Examination, which may be had on application at the Hall of the Royal College of Physicians, or at the Hall of the Royal College of Surgeons.

The First Examination in General Education under the Code will take place on Tuesday the 1st of November, 1859.

The First Professional Examination will take place on Wednesday, the 9th November, 1859.

ALEXANDER WOOD, M.D.

President, Royal College of Physicians.

ROBERT OMOND, M.D.

President, Royal College of Surgeons.

Edinburgh, 1st September, 1859.

H. Silverlock's Medical Label Ware-

HOUSE, Letter-Press, Copper-plate, and Lithographic Printing Offices, Wardrobe-terrace, Doctors'-commons, London, E.C.

H. SILVERLOCK'S stock of Labels for Dispensing purposes having been recently revised and enlarged, now consists of upwards of 800 different kinds. Yellow and Green Labels for Drug Bottles, Drawers, &c., at per book or dozen: a Book, containing a selection in general use in Surgeon or Dispensaries, 10s. 6d. Priced Catalogues of the above may be had, post free, on application. Printing of every Description at Moderate Prices. st

ANATOMICAL

APPLIANCES.

HER MAJESTY THE QUEEN, having specially honoured Mr. HEATHER BIGG, of 29, LEICESTER-SQUARE, (Author of "Artificial Limbs, their Construction and Application," "Deformities; and the Mechanical Appliances required for their Treatment,") with a command to construct Mechanical Appliances for those wounded Soldiers recommended to her gracious consideration, has led him to bestow considerable attention upon the scientific arrangement of such appliances; he, therefore, begs to invite Officers and others who are labouring under loss of limb, &c., to examine the Artificial Legs, Artificial Arms and Hands, Spinal Apparatus, &c., he possesses.

Mr. HEATHER BIGG having also recently visited the principal Orthopædic Establishments of Paris, Vienna, Munich, Stutgard, Berlin, Dresden, Frankfort, Cronstadt, &c., for the purpose of ascertaining what new appliances existed for the treatment of deformities, gladly places at the disposal of the Medical Profession the experience so obtained.

Mr. HEATHER BIGG having been for several years Anatomical, Surgical, and Orthopædic Mechanist to the Royal Hospitals of Chelsea and Greenwich, the Admiralty, the Hon. Board of Ordnance, the Hon. East India Company, St. George's, Middlesex, University College, King's College, Royal Free, Guy's, and St. Thomas's Hospitals, has devoted considerable time and experience to the invention, construction, and adaptation of every variety of Anatomical Appliance, and takes this opportunity of inviting the attention of the Medical Profession to the New and valuable Inventions he possesses for affording mechanical aid in cases of Talipes Varus, Valgus, Equinus, and Calcaneus; Lateral, Posterior, Rotative, and Anterior Curvature of the Spine; Inguinal, Femoral, Umbilical, and Ventral Hernia; Prolapsus Uteri and Ani; as well as every variety of Anatomical Deformity.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

CAUTION.

Serious and repeated complaints having been made of a discreditable system pursued by many Chemists and Druggists of intrusively recommending or surreptitiously substituting a pale, yellow, or coarse brown preparation, when Dr. DE JONGH'S Oil is prescribed, the Medical Profession are respectfully and earnestly solicited to afford their assistance in counteracting and repressing a practice alike injurious to their patients and to the fair repute of a remedy now held in such high and general estimation. In all cases where this Oil cannot be procured from a respectable Chemist, application should be made to Dr. DE JONGH'S Agents,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

By whom any quantity will be immediately forwarded.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. Mr. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

The London and Provincial Medical

PROTECTION SOCIETY, 43, Lincoln's-inn-fields, London. Conducted by a responsible Committee of Medical Men.

TREASURER—Robert Dunn, Esq.

BANKERS—Messrs. Gosling and Sharpe, 19, Fleet-street.

SECRETARY—John Capes, Esq.

The objects of the Society are—

1st. To provide a safe and efficient medium by which the Medical Profession may secure more certain and regular payment for their services, with every consideration for the convenience of those who are willing, but unable directly to discharge their liabilities; with rigour from those who are able, but have not the disposition, to remunerate medical men.

These ends to be accomplished without interfering with the valuable time of the Members of the Profession, or exposing them to the unpleasantness which necessarily attends applications for money, or to the uncertainty and risk of employing private collectors.

2nd. To assist members with information and advice in the purchase and sale of practices.

3rd. To raise a Benevolent Fund by devoting to that object the profits arising from the general operations of the Society.

The Society consists of qualified Medical Practitioners only. Annual Subscription, One Guinea; a Firm, consisting of Two Partners, a Guinea and a-half; a Firm of three Partners, Two Guineas. Fixed rates of Commission are also charged on Business transacted.

The general business is carried on by a staff of officers at the Central Office, 43, Lincoln's-inn-fields, together with trustworthy employees appointed in town and country, the whole of whom, are under the direction and superintendence of the Committee.

The Metropolitan Members of the Committee, with the Trustees, are responsible for all moneys received by the Staff.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.

Important Saving, by Prepayment,

in the PURCHASE of

NEW WHITE ROUND MOULDED VIALS OF THE BEST QUALITY.

To Surgeons, Dentists, &c. — The

Best House in London for SECOND-HAND INSTRUMENTS is Mr. WM. LAWLEY'S, Lombard-house, 78, Faringdon-street, City. Established upwards of a Century. A large stock of New Instruments always on sale, all warranted. Instruments bought, sold, or exchanged.

N.B.—The largest stock of Second-hand Dissecting Cases in London.

Blancard's Pills of Unchangeable

IODIDE OF IRON,

Recommended by the Academy of Medicine of Paris, And authorised by the Medical Council of St. Petersburg, Extensively tried in the Hospitals of France, Belgium, Ireland, Turkey, &c. Favourably noticed at the Universal Exhibition of New York, 1853, and Paris, 1855.

"Of all the modes hitherto proposed of administering iodide of iron in the pure state, I think Mr. Blancard's the best."—Chemistry applied to Therapeutics, by M. Mialhe, Deputy-Professor to the Faculty of Medicine of Paris, Pharmacien to the Emperor, 1856, p. 319.

These Pills stand now very high in the therapeutics of every country, as may be seen by the above quotations, and also by the numerous scientific articles in medical periodicals and works (a).

Being enveloped in a very thin resino-balsamic coating, they present the great advantage of not being liable to any deterioration, of having no taste, of being small, and not distressing the stomach. As they possess the properties both of iodine and iron, they are especially beneficial in chlorotic, scrofulous, tubercular, or cancerous affections, as also in leucorrhœa, amenorrhœa, anæmia, &c. &c., and they furnish the medical man with an excellent means of modifying lymphatic, feeble, and debilitated constitutions. Dose, 2 to 4 pills a day.

N.B.—Impure or altered Iodide of Iron is an unsafe remedy, and may even prove dangerous. Only such bottles as bear an electro-plated seal fixed to the lower part of the cork, and the signature of the inventor placed on a green label, are to be considered as prepared by Mr. Blancard. The public should beware of spurious imitations.

To be had at M. BLANCARD'S, Pharmacien, Rue Bonaparte, No. 40, Paris. General dépôt in England at M. Gabriel Jozeau's, French chemist, 49, Haymarket, London. In Ireland, at Mr. Vitties, Stevens's Hospital, Dublin. In the United States, at E. and S. Fougere, Chemists, 30, North William-street, New York. To be obtained retail from the principal Chemists.

(a) Bulletin de l'Académie de Med 1850, page 1015; Gazette Médicale, Aug. 17, 1850; Union Médicale, Aug. 15 and 22, 1850; Gazette des Hôpitaux, March 15, 1853, and June 10, 1854; Gazette Hebdomadaire de Médecine et de Chirurgie, Aug. 31, 1855; Revue de Thérapeutique Médico-Chirurgicale, Feb. 15, 1855; Abeille Médicale, Revue Clinique; Répertoire de Chimie et de Pharmacie; Annuaire de Thérapeutique pour 1851, page 199; Orfila, Elements of Chemistry; Mialhe, Chemistry applied to Therapeutics, 1856, p. 319; Quevenne, Essay on the Physiological and Therapeutical Action of Preparations of Steel, page 97, 1854; Bicheteau, Treatise on Chronic Diseases seated in the Respiratory Organs; Soubeiran, Treatise on Pharmacy; Dorvault, Officine, &c. &c.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 28s. per lb.

The Medicinal value of this Scammony was fully explained at a meeting of the Pharmaceutical Society, and reported at length in their journal of March last, from which the following are extracts:—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with.

"A. B. GARROD, M.D., F.R.S., F.R.C.P.

"Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens.

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs M'Andrew's scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power.

"GEORGE JOHNSON, M.D., F.R.C.P.

"Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

Williams and Son's Pure Glycerine

SOAP. Analysed by Dr. Hofmann, F.R.S., and Professor Redwood, Ph.D., strongly recommended by many eminent members of the Medical Profession, and favourably noticed by the following Medical Journals:—

THE LANCET.
THE MEDICAL TIMES AND GAZETTE.
THE BRITISH MEDICAL JOURNAL.
THE MEDICAL CIRCULAR.
EDINBURGH MEDICAL JOURNAL.
THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate skin (whether arising from disease or otherwise), and is admirably adapted for nursery use. May be had of all respectable Chemists, Perfumers, &c.

SOAP-WORKS, CLERKENWELL, LONDON, E.C.

WATER BEDS.—EDMISTON and SON, 5, Charing-Cross, beg to call

the particular attention of the Managers of Hospitals and Dispensaries, and the Medical Profession generally, to the prices and quality of their Hot or Cold Water Beds. The prices hitherto charged being so high as to limit the sale of such articles to the affluent, they are induced to offer them at such prices as will enable the public generally to realise the advantage and comfort to be derived from their use.

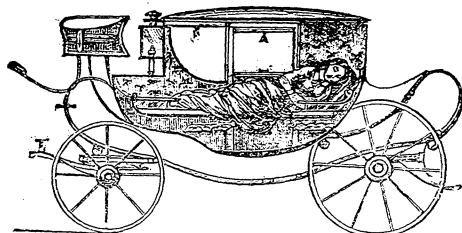

WATER BEDS, £3 13s. 6d., £5 5s., and £6 16s. 6d.

Water Pillows and Cushions, 7s. 6d. to 21s. Urinals, from 3s. 6d. to 12s. 6d. Cotton Elastic Stockings, 4s. 3d. Silk, 5s. 3d. Knee Caps, Leggings, Anklets, &c.

BED SHEETS, ACCOUCHMENT BELTS, &c.
India-Rubber Chamber Utensils for Lunatic Asylums, 7s. 6d. each, or 75s. per dozen.

7s. 6d. PER WEEK.

LONDON: EDMISTON AND SON, 5, CHARING-CROSS, LATE 69, STRAND.

IMPROVED INVALID COT CARRIAGES,

THE GREATEST LUXURY AND COMFORT EVER INTRODUCED FOR REMOVING INVALIDS, BEING FITTED UP WITH THE

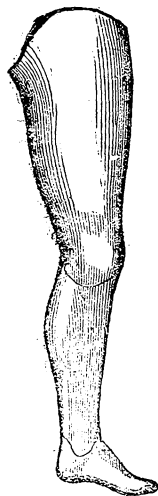

PATENT NOISELESS WHEELS.

These Carriages may be engaged, on moderate terms, for any journey, on application to

H. & J. READING,

COACHBUILDERS, 14, RIDING-HOUSE-STREET, CAVENTISH-SQUARE.

Also a good assortment of New and Second-hand Broughams and other Carriages for Sale or Hire.

ARTIFICIAL LEGS AND HANDS.

PARIS PRIZE MEDAL, 1855.

GROSSMITH'S NEW ARTIFICIAL LEG,

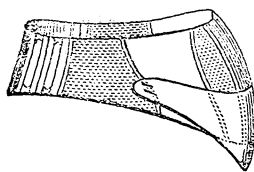

WITH PATENT ACTION, KNEE AND ANKLE JOINTS,

Enables the patient to walk, sit, or ride with ease and comfort, wherever amputated. It is much lighter and less expensive than the old style of cork leg, will last a lifetime, and is the only leg yet invented that Ladies and Children can wear with safety. It was awarded the highest Medal at the recent Paris Exposition, although more than twenty other makers from different nations exhibited. Can be obtained only at Grossmith's Manufactory, 175, Fleet-street, London (Established 1760); of Fannin and Co., Dublin, or at Charrieres, Paris.

** Artificial Hands and Arms, Fingers, Eyes, Noses, &c., with all the most recent patent improvements.

J. & E. BRADSHAW, late

Shoolbred and Bradshaw, 34, Jermyn-STREET, begs to call attention to the various improvements in

PATENT ELASTIC STOCKINGS, BELTS, KNEE-CAPS, SOCKS, and Ladies' and Gentlemen's SPINE-SUPPORTERS. A new description of **BELT** invaluable for prevention of Cholera, and the cure of Rheumatism, Lumbago, &c. —N.B. Every description of **INDIA-RUBBER BANDAGE**, vulcanized on the newest principle.

Directions for measurement sent by post. N.B. A liberal Discount to the Profession.

A female to attend on Ladies.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

"Somerset,

June 20th, 1858.

"DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT IN WEIGHT, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly,
J. W.

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street."

Human Osteology from France.

RAGINEL, 38, Ludgate-hill, City, E.C., London. Patronised by the Royal College of Surgeons of England. Illustrated Osteology on the bones themselves. Very large Stock on the lowest possible terms. Disarticulated Skulls, in twenty-two pieces, in box. All the bones of the disarticulated skulls will be fitted in right order in the presence of the purchaser so as to shew that every bone of each set belongs to the same Skull; it will be the same for all other disarticulated pieces. Skulls with Sections. Hands and Feet on catgut. Disarticulated Skeletons, quite complete, with the Skull same body. Articulated Male Skeletons, the bones very well marked.

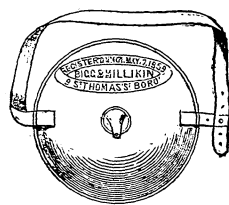

STUDENT'S CASE OF OSTEOLOGY, COMPLETE.
Splendid Pieces for Lecturers and Museum.

Professors of Anatomy and STUDENTS

are invited to inspect the Stock of Skeletons, Skulls, separated and entire—Vertebrae, Hands and Feet on catgut, and various loose bones, which are well prepared, perfectly white, and free from grease or smell. The selection of this stock having been made by a good Anatomist, W. M. can confidently recommend them as being well marked, perfect bones, at low prices.

W. MATTHEWS, 8, Portugal-street, Lincoln's-inn-fields, London.

Registered No. 4171,

May 7th, 1859, by BIGG & MILLIKIN, 9, St. Thomas'-street, Borough, MADAME HARRIOTE'S MAMMARY FEEDING BOTTLE, or Artificial Breast, by which an infant can receive its food in the most natural position, and be deceived by its pliable and soft texture. It has many advantages that none but a mother can appreciate.—To be had only at BIGG & MILLIKIN'S, Instrument Makers to Guy's and St. Thomas's Hospitals, 9, St. Thomas'-street, Borough.

"PULVIS JACOBI VER., NEWBERRY'S."

As the importance of

this Medicine is receiving increased acknowledgment Messrs. NEWBERRY, to confirm its efficacy and specific character, beg to direct attention to the Paper by the late Dr. Cheyne in the first vol. of the "Dublin Hospital Reports," p. 315; likewise to the "British Medical Journal," No. 88, p. 737; also to the "Lancet," No. 5, vol. ii., 1859 (Dr. Grant, of Poona): all of which illustrate its importance as an invaluable remedy. Messrs. Newberry, as partners and co-patentees with the late Dr. James, continue to prepare the original article, reported on as above.

45, St. Paul's Churchyard, London.

Established A.D. 1746.

Price, for dispensing, 9s. per oz.; ½ oz., 3s. 4d.

Microscopic Glass.—Thin Glass for

Mounting Objects, in squares or circles. Slides 3 in. by 1 in., and Cells of every kind, supplied Wholesale and Retail, by CLAUDET and HOUGHTON, 89, High Holborn, London.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

Hospital for Sick Children, 49, Great

ORMOND-STREET.—A SERIES of LECTURES on the DISEASES OF CHILDREN will be given every SATURDAY during the months of NOVEMBER, DECEMBER, and JANUARY, by Dr. WEST, Dr. JENNER, and Mr. ATHOL JOHNSON, the Physicians and Surgeon of the Hospital. The First Lecture will be given on SATURDAY, NOVEMBER 12, at 3 p.m., by Dr. WEST.

By order of the Committee of Management,
H. A. BATHURST, Hon. Secretary.

Brighton Orthopædic Hospital, Farm-

ROAD, WESTERN-ROAD.
For affording Professional Treatment, together with the benefit of Sea-air, to the poor from all parts of the Kingdom, afflicted with deformity, &c.; in part self-supporting, in part aided by Voluntary Contributions.

Consulting Surgeon—Joseph Amesbury, Esq.
Surgeon—Richard Hughes, Esq.

Treasurers—Messrs. Hall and Co., Bankers, North-street, Brighton.

Clinical Midwifery. — The Medical

OFFICERS of the BRITISH LYING-IN HOSPITAL will deliver CLINICAL LECTURES on MIDWIFERY during the WINTER SESSION of 1859-60. The Lectures will be delivered at the Hospital once in each week. Resident Pupils are admitted to this Course of Lectures without Fee. Fee to non-Resident Pupils, Four Guineas. Pupils attending these Lectures will have the privilege of attending Cases, under direction of the Medical Officers.
EDWIN PHILLIPS, Secretary.

British Lying-in Hospital, Endell-street, Long-acre.

Medical Pupil.—A Lecturer in a

Provincial School of Medicine, who has taken high honours in his Profession, wishes to receive into his house from the 1st of October next, a gentlemanly youth as ARTICLED PUPIL. Terms, 100 Guineas per annum. Address, A.B., 25, Paternoster-row, London.

An old-established General Practice in

a small Market Town in one of the Midland Counties to be disposed of for One Year's purchase of the gross cash receipts, viz. about £500. No public appointments, and only one opponent. No midwifery under £1 ls. A good introduction will be given. Apply to Mr. Nathaniel Smith, 373, High-street, Cheltenham.

Gainsborough Dispensary.—A House-

SURGEON is required for this Institution. He must be registered under the new Medical Registration Act. His duty will be found in the rules, an abstract of which may be had on application, post-paid, to W. H. Caldicott, Gainsborough. Salary, £90 per annum. A furnished house is provided, rent and taxes free, with an allowance of £5 for coals. Certificates of ability, &c. to be sent to Mr. Caldicott before the day of Election, which will take place at the Town-hall, Gainsborough, on Friday, the 21st day of October at eleven o'clock in the forenoon.

Gainsborough, September 20, 1859.

Private Establishment for the Insane,

CHURCH STRETTON, near SHREWSBURY. This Establishment is conducted by the Resident Proprietor, Dr. S. G. BAKEWELL, Son of the late Mr. Bakewell, of Spring Vale, Staffordshire.

The Ladies occupy a separate residence, and are under the immediate care of Mrs. Bakewell.

The neighbourhood of Church Stretton is very picturesque and healthy. Its similarity to Malvern is often noticed.

A Carriage is kept for the use of the Inmates.

References can be given to Medical Gentlemen and others in Shrewsbury, Birmingham, Hereford, and throughout Staffordshire.

The Reports of the Commissioners in Lunacy, and of the Visiting Magistrates, will be shown on personal application.

Church Stretton is a first-class Station on the Shrewsbury and Hereford Railway, twelve miles from Shrewsbury.

Eligible Opportunity. — An open

SURGERY to be disposed of, in a most fashionable and rising neighbourhood. The opportunity is unusual. No open Surgery to compete with. Rent moderate. Stock of the best description, suitable for a Surgeon and Chemist. Fittings quite new. No Agent will be treated with. Price £180. For further particulars, apply by letter to M.B., care of Mr. Kingston, Chemist, 6, Devonshire-terrace, Notting-hill, W.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honorable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Obstetrical Society of London.—The

next ORDINARY MEETING will be held on WEDNESDAY, Oct. 5, at 8 p.m.; the President, Dr. RIGBY, in the Chair.

The First Session of the Society will terminate in December, up to which time no Entrance Fee will be demanded. The Council beg to intimate their intention of recommending the Society to require the payment of an Entrance Fee of One Guinea, in addition to the Annual Subscription, by Fellows elected subsequently to this date.

Gentlemen desirous of becoming Fellows are requested to apply to one of the Honorary Secretaries.

By Order of the Council, GRAILY HEWITT, } Hon. Secs.
53, Berners-street. THOS. H. TANNER, }

Lock Hospital.—The Offices of House-

SURGEON and **APOTHECARY** are now VACANT. Applications to be made to the Secretary, at the Hospital, Preference will be given to qualified Candidates

By Order,

G. T. FRED. ABRAHAM, Secretary.

Lock Hospital, Westbourne-green, Harrow-road, W.

A General Practitioner in one of the

Western Counties is in immediate want of an ASSISTANT to dispense and visit occasionally, and competent to attend midwifery. The duties are light, with great opportunity for improvement. Any gentleman wishing for a comfortable home and kind and gentlemanly treatment with moderate salary, may address M.R.C.S.E., "Medical Times and Gazette" Office, New Burlington-street, London, giving references and salary required.

Dr. Watson, F.R.C.S., Surgeon to the

Edinburgh Eye Infirmary, and New Town Dispensary, Assistant-Surgeon Edinburgh Volunteer Rifles, late Assistant-Surgeon Royal Artillery, will commence his Course of Lectures upon the PRINCIPLES AND PRACTICE OF SURGERY, at the Surgical Theatre, No. 3, Infirmary-street, on THURSDAY, November 3, 1859, at 10 o'clock a.m.

This Course qualifies for all the Public Boards.

10, Charlotte-square, Edinburgh, September 14, 1859.

Royal College of Physicians of

EDINBURGH.

At an EXTRAORDINARY MEETING of the ROYAL COLLEGE of PHYSICIANS of EDINBURGH, held on Friday, the 19th of August, the following Resolution was unanimously agreed to:—

"That, in accordance with the opinion expressed by the General Council of Medical Education and Registration, on the 8th August, the Royal College of Physicians of Edinburgh do institute an Examination in Practical Medicine, to be undergone by Candidates, other than University Graduates claiming exemption under the Charter of the College; and that the College agree to alter Law 8 of the Regulations for the admission to the Licence, in accordance with the preceding Resolution."

The opinion of the General Medical Council, as expressed on the 8th August, is all follows:—

"That the General Medical Council is of opinion, that for the future no Licence or Degree should be given by any of the bodies in Schedule (A) to the Medical Act, without Examination."

The eighth Regulation, regarding the conferring of the Licence of the College, ran thus:—

"For one year after the passing of these Regulations (20th April, 1859), Licentiates of any of the existing Licensing Boards may be admitted Licentiates of the College without Examination, provided that they do not derive any profit from the sale of Drugs or Medicine, and that they produce certificates of character and professional qualification satisfactory to the College."

In conformity with the above Resolution, all Applicants under Regulation 8, for the Licence of the Royal College of Physicians of Edinburgh, with the exception of Graduates of British Universities, will in future be required to appear before the Examiners of the College, and to pass an Examination in the Practice of Medicine.

The Stamp duty on the Diploma having been remitted, the Fee payable by Licentiates is now Ten Pounds.

In name and by authority,

Edinburgh, August 19, 1859. D. R. HALDANE, M.D., Hon. Sec.

London: Printed by CHARLES REED and BENJAMIN PARDON of 1, 2, and 3, Lovell's-court, Paternoster-row, in the City of London, and published by JOHN CHURCHILL, at the Publishing Office, No. 11, New Burlington-street, in the Parish of St. James, in the City of Westminster.—September 24, 1859.

Practical Pharmaceutical Chemistry:

An Explanation of Chemical and Pharmaceutical Processes, with the Methods of Testing the Purity of the Preparations, deduced from original experiments. Translated from the second German Edition of Dr. G. C. WITTSTEIN, by STEPHEN DARBY.

This is an eminently practical and useful book, and only requires to be examined by the Pharmacist to ensure its being at once adopted as his guide and text-book. It gives, not only the best processes for the preparation of every chemical substance used in medicine, but such clear instructions for the manipulations and explanations of the chemical actions, that a student by its aid alone could prepare them with certainty and understand them fully. In fact, it would so far make him an accomplished chemist. But to those engaged in manufacturing medicine chemicals it must be extremely valuable, economising time and materials, and ensuring results as accurate and certain as if the object were merely scientific. This is of great importance, because the process recommended in treatises on purely scientific chemistry are not always applicable in working commercially, or in quantities, and therefore are not so useful to the Pharmacist. It is no less valuable in the shop than in the laboratory; the nature and composition of every chemical substance, including those derived from vegetables, the alkaloids, &c., are given in the most correct manner, together with the easiest and surest methods of testing their purity, and detecting admixtures or impurities, whether arising from defective manufacture or fraudulent additions.

The translator has performed his task very creditably. He has adhered to the use of the German nomenclature, which some may object to; but as the synonyms in use here are always appended, it seems to us to be judicious, as the free intercourse of their terms of art and science itself a people renders a knowledge of their terms of art and science itself a useful acquirement. We think the high encomiums bestowed on the work by that eminent Pharmacist Buchner, in a preface, are fully justified; and should it become, as it ought, the companion and handbook of English Pharmacists, it will tend to elevate the profession by giving it a firm scientific basis, which will soon become manifest in improvements and discoveries in their science and art, where a wide field still exists to reward the diligent and skilful explorer.

John Churchill, New Burlington-street.

Just published, Second Edition, revised, with considerable Additions,
post 8vo, cloth, 9s.

A Guide to the Practical Study of DISEASES of the EYE.

By JAMES DIXON, Surgeon to the Royal London Ophthalmic Hospital.
"This second edition is both enlarged and improved, and we can recommend the work to be really what it professes—A Guide—and a very useful and trustworthy guide—to the Practical Study of Diseases of the Eye."

John Churchill, New Burlington-street.

For Infants.—The British Feeding

BOTTLE (registered) may be placed in any position without the Food running out. The supply can be regulated by a stop-cock; being electroplated, it may be instantaneously cleaned. Unlike wood, ivory, or bone, it is impervious to moisture, cannot crack or become sour; there is no possibility of the infant drawing air with the food.

By W. T. COOPER, Pharmaceutical Chemist, 26, Oxford-street, London.
Price 7s. 6d., or free to any Railway Station, 8s. 6d.

"PULVIS JACOBI VER., NEWBERRY'S."

Diphtheria, Fevers, Hooping Cough,

&c.—We beg to caution the Profession against imitations of this invaluable Medicine, for so many years prescribed as "Pulvis Jacobi Ver." but to which it is now necessary to add the name "NEWBERRY'S," to secure prescribers against the SUBSTITUTION of articles advertised as James' Powder, BUT WHICH HAVE NOTHING IN CHARACTER, DOSE, OR EFFECT, with the original article, which has been sold by the Newbery Family continuously since its introduction in 1746.

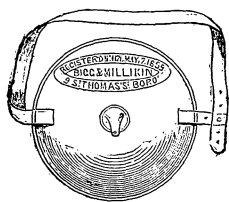

Price, for dispensing: 1 oz. bottles, 9s.; ½ oz. do. 3s. 4d.

45, St. Paul's-churchyard, London. (Signed) F. NEWBERRY & SON.

Pepsine.—M. Boudault begs to state

that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr. PETER SQUIRE, her Majesty's Chemist, 277, Oxford-street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on "Pepsine," with Remarks by English Physicians. Edited by W. S. SQUIRE, Ph. D., published by J. Churchill, London, may be also had of the Author, 277, Oxford-street, price Sixpence.

Registered No. 4171,

May 7th, 1859, by BIGG & MILLIKIN,
9, St. Thomas'-street, Borough, MADAME
HARRIOT'S MAMMARY FEEDING
BOTTLE, or Artificial Breast, by which an
infant can receive its food in the most natural
position, and be deceived by its pliable and
soft texture. It has many advantages that
none but a mother can appreciate.—To be
had only at BIGG & MILLIKIN'S, Instrument
Makers to Guy's and St. Thomas's
Hospitals, 9, St. Thomas'-street, Borough.

J. & E. BRADSHAW, late

Shoolbred and Bradshaw,

34, JERMYN-STREET,

begs to call attention to the various improvements in
Patent ELASTIC STOCKINGS, BELTS, KNEE-CAPS,
SOCKS, and Ladies' and Gentlemen's SPINE SUP-
PORTERS. A new description of BELT, invaluable for
prevention of Cholera and the cure of Rheumatism,
Lumbago, &c.

N.B. Every description of INDIA-RUBBER BAN-
DAGE, vulcanised on the newest principle.

Directions for measurement sent by post.

N.B. A Liberal Discount to the Profession.

A Female to attend on Ladies.

Carriages, New and Second-hand, of

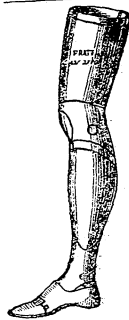

superior style, sterling quality, and finest finish at reasonable rates,
for cash, credit, job, or exchange. Circular of prices on application.
Credit given when required. Buyers should take carriages on trial, with
power to purchase by yearly payments, and thus prove them.

OFFORD'S PATENT MEDICAL MAN'S BROUGHAM MANUFAC-
TORY, 79, WELLS-STREET, OXFORD-STREET.

Or SACCHARATED CAPSULES.—Copaiba and Cubeba are, doubtless,
the best remedies, but these drugs are of a repulsive taste and odour,
and occasion colicky pains, nausea, and gastric disturbance. M. Jozeau has
succeeded in rendering these valuable therapeutic agents perfectly inno-
cuous, by increasing, in his Copahine, all the curative properties. This
preparation has been adopted by the Paris Academy of Medicine, after
more than a thousand trials in Paris, and the different London Hospitals,
viz., St. Thomas's, Guy's, and St. Bartholomew's, under the care of Messrs.
Lloyd, Poland, and Le Gros Clark. "Lancet," Nov. 6, and Dec. 10, 1852.
The Copahine, which is in form of a pretty pink sugar-plum, effects a cure
in about six days, either in recent or chronic diseases. 100 Capsules, 4s. 6d.,
at G. JOZEAU'S, French Chemist, 49, Haymarket, London; 22, Rue St.
Quentin, Paris; and all the most important Chemists.

S. Bowles, late Windsor & Co., Phial
and BOTTLE MERCHANTS, Dealers in Druggists' Sundries, &c.,
6, James-street, Covent-garden, W.C. The cheapest house in London
for every description of Medical Glass of the best quality.
Samples and Prices forwarded free on application.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession
to the following Testimonial, just received:—

"Somerset,

June 20th, 1858.

"DEAR SIR,—It affords me much pleasure in being able
to state that the Artificial Leg which you supplied me
with is far beyond my best anticipations. From its
being so LIGHT IN WEIGHT, and its action in the foot so
natural, I can walk, or ride on horseback, with ease
and comfort; and few indeed would detect it as being
other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly,
J. W.

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street."

Human Osteology from France,

RAGINEL, 38, Ludgate-hill, City, E.C., London. Patron-
ised by the Royal College of Surgeons of England. Illustrated
Osteology on the bones themselves. Very large Stock on the
lowest possible terms. Disarticulated Skulls, in twenty-two
pieces, in box. All the bones of the disarticulated skulls will
be fitted in right order in the presence of the purchaser so as
to show that every bone of each set belongs to the same
Skull; it will be the same for all other disarticulated pieces.
Skulls with Sections. Hands and Feet on catgut. Disartic-
ulated Skeletons, quite complete, with the Skull same body.
Articulated Male Skeletons, the bones very well marked.
STUDENTS CASE OF OSTEOLOGY, COMPLETE.
Splendid Pieces for Lecturers and Museum.

Professors of Anatomy and

STUDENTS

are invited to inspect the Stock of Skeletons, Skulls,
separated and entire—Vertebrae, Hands and Feet on
catgut, and various loose bones, which are well pre-
pared, perfectly white, and free from grease or smell.
The selection of this stock having been made by a
good Anatomist, W. M. can confidently recommend
them as being well marked, perfect bones, at low
prices.

W. MATTHEWS, 8, Portugal-street, Lincoln's-inn-fields,
London.

TRADE MARK.

Brown & Polson's Patent Corn Flour,

preferred to the best Arrowroot. DELICIOUS in PUDDINGS, CUSTARDS
BLANCMANGE, CAKE, &c., and especially suited to the delicacy of
CHILDREN and INVALIDS.

The Lancet states—"This is superior to anything of the kind known."

Trade Mark and Recipes, on each Packet, 4, 8, and 16 oz.

Obtain it from Family Grocers, Chemists, &c.

77A, Market-street, Manchester; and 23, Ironmonger-lane, London.

Williams and Son's Pure Glycerine

SOAP. Analysed by Dr. Hofmann, F.R.S., and Professor Red-
wood, Ph.D., strongly recommended by many eminent members of the
Medical Profession, and favourably noticed by the following Medical
Journals:—

THE LANCET.

THE MEDICAL TIMES AND GAZETTE.

THE BRITISH MEDICAL JOURNAL.

THE MEDICAL CIRCULAR.

EDINBURGH MEDICAL JOURNAL.

THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate skin (whether arising from disease
or otherwise), and is admirably adapted for nursery use. May be had of
all respectable Chemists, Perfumers, &c.

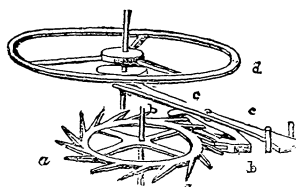

SOAP-WORKS, CLERKENWELL, LONDON, E.C.

Health, Fresh Air, and Pure Water.

—By Her Majesty's Letters Patent.—CONDY'S FLUID contains
NASCENT OXYGEN, nature's true and only purifying agent; instantly
removes all offensive smells; renders impure water fresh, and the air
pure; when diluted for use, is of a beautiful colour, not soiling the
finest linen; is harmless, and particularly adapted for toilet use, being
both refreshing and exhilarating. The Medical Profession have expressed
their unqualified approbation of its merits. One gallon makes 200 gallons
adapted for use. The cooling, healing, gently stimulating and invigorating
properties of this Fluid render it, when diluted, a lotion possessing pecu-
liar and valuable characteristics, whether for bathing the bodies of invalids,
incorporating in poultices, or washing and healing wounds. Patronised
by the Board of Health, and most public departments, hospitals, schools,
and adopted by the India Council in preference to all other disinfectants.
In bottles, 6d. 1s. and 2s.; stronger and purer, 1s. 2s. and 4s.

CONDY'S PATENT HEALTH POWDER also contains NASCENT
OXYGEN, is odourless, and destroys all smells; in bottles, 1s. 6d. and 3s.,
and in casks of 1 cwt. 36s.—Wholesale agents, John Bell and Co. chemists,
No. 338, Oxford-st. W.; Butler and Crisp, 5, Cheapside, St. Paul's; Ferris
and Co., Bristol.—Chemical Works, Batterssea, S.W.

LEVER ESCAPEMENT.

Benson's
WATCHES.
"Perfection of mechanism."—
Morning Post.

Send two stamps for Benson's
Illustrated Watch Pamphlet.
Watches sent free to any part
of the Kingdom on receipt of a
remittance.

33 & 34, LUDGATE-HILL, LONDON, E.C. ESTABLISHED 1749.

To the Medical Profession, Lecturers and

OTHERS.—Mr. J. C. STEVENS is instructed to sell by AUCTION on Wednesday, 19th October, at Twelve o'clock, on the premises, No. 27, Alfred-place, Bedford-square, A most RARE and VALUABLE MUSEUM of WAX MODELS and DRY PREPARATIONS, Collected at Florence, Rome, &c. containing many hundred Models of the Human Frame in Health and Disease, also a Medical Venus, and a splendid full-length figure with fetus and other valuable models "en suite." On view the day before the Sale, and Catalogues had on the Premises, and at Mr. J. C. Stevens' Auction Rooms and Offices, 38, King-street, Covent-garden.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, previous, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

Great Saving in the Purchase of New

MEDICAL GLASS BOTTLES and PHIALS at the NORTH LONDON GLASS BOTTLE WORKS, ISAACS and SON (Proprietors).—London Warehouses, 24 and 25, Francis-st., Tottenham-court-road, W. C. 6 and 8 oz., any shape, plain, or graduated } clear { 8s. per gross.

BRANCHES AT CALCUTTA, MADRAS, AND BOMBAY.
Empowered by Special Act of Parliament, 6 William IV. c. 54.
For the Assurance of Lives, at Home and Abroad, in the Civil, Military, and Naval Services.
The Funds Invested and the Subscribed Capital exceed £1,180,000.

DIRECTORS.

John Stewart, Esq., Chairman.
Charles Dashwood Bruce, Esq., Deputy-Chairman.
Augustus Bosanquet, Esq.
Ellis Watkin Cunliffe, Esq.
Herbert George Jones, Serjeant-at-Law.
William Kilburn, Esq.
John Farley Leith, Esq.
Francis Macnaghten, Esq.
Major John Arthur Moore.
William Norris Nicholson, Esq.
William Rothery, Esq.
Brodie M'Ghie Wilcox, Esq. M.P.

AUDITORS—Rt. Gardner, Esq.; Rt. Hichens, Esq.; H. W. Ripley, Esq.
BANKERS—The Bank of England, and Messrs. Currie and Co.
SOLICITORS—Messrs. Cotterill and Sons, and Messrs. Parke and Pollock.
PHYSICIAN—Geo. Burrows, M.D., F.R.S., 18, Cavendish-square.
SECRETARY—Michael Elijah Impey, Esq.

After the operations of a Quarter of a Century, the Directors invite, with great confidence, the attention of the Public to the marked success which has attended this Society, and to the strong claims it possesses to the confidence and support of all classes desirous of effecting Assurances on Lives. Combining the advantages of a Mutual and a Proprietary Company, and without attempting a rash competition with other Offices, it has pursued a steady, progressive course, affording all the benefits which, consistently with security to Assurers and Assured, can possibly be given.

The amount of the Society's Funds actually Invested exceeds £730,000. Upwards of £997,380 have been already paid in Claims and Bonuses, and the existing Policies amount to £2,214,928.

The Tables of Rates for Residents in Europe have been prepared upon the most approved principles to ensure moderation and security.

Assurances can be effected with or without a Participation of Profits; on ascending or descending scales; and for a limited number of payments.

The Society advance money on Mortgage; purchase Reversions and Life Interests; and grant Loans on such Securities and on Policies.

An Annual Division of One-fifth of the Profits is made, 75 per cent. of which is appropriated to Policy-holders, and 25 per cent. to the Shareholders; the remaining four-fifths are set apart towards the average of succeeding years. The Assurers can apply their Profits to the immediate Reduction of their Premiums, or as a Bonus to the sum assured.

All Medical Fees and Stamps are paid by the Society.

INDIAN BRANCH.

The Universal was the first Assurance Society that secured to Residents in India fixed rates and the advantages enjoyed by those in Great Britain.

Separate Tables for the Civil and Military Services were originally framed with the utmost care from the Records of the India House, and valuable statistical returns accessible to this Society alone. To test their adaptation to the present time, and to ascertain whether any reduction could be safely made, they have recently undergone a minute and laborious investigation by two eminent London Actuaries, whose Report has established their soundness and accuracy.

Notwithstanding the extraordinary mortality occasioned by the late Mutiny, the Directors were enabled at the last Annual Division of Profits to announce a Reduction of Premiums on all Policies dated prior to 11th May, 1854, of £36 per cent.—a result attributable, in a great measure, to the correctness of the Rates and the judicious management of the Local Committees in India.

The attention of persons proceeding to India, and of residents there, is requested to a peculiar and most important advantage offered by this Society,—that on the return of Assurers to Europe the premiums on their Policies will be reduced to the English scale corresponding with the age when the Assurance was effected, without reference to the state of their health on their return.

Tables of Rates and all further information will be afforded at the Office in London, or by the Agents in India:—

Messrs. BRADDON and Co., Calcutta.
Messrs. BAINBRIDGE, BYARD, GAIR, and Co., Madras.
Messrs. LECKIE and Co., Bombay.
MICHAEL ELIJAH IMPEY, Secretary.

King William-street, E.C., June, 1, 1859.

Crosse and Blackwell, Purveyors in

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloaters Pastes, Strasbourg and other Potted Meats, and Calf's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of
CROSSE and BLACKWELL, 21, Soho-square.

Superphosphate of Iron and Super-

PHOSPHATE of IRON and LIME. New Remedial Agents introduced to the notice of the Profession at the Meetings of the Medical Society of London, and now extensively employed by the most eminent members of the Medical Profession. The Syrup is the most eligible mode of administering these valuable Remedial Agents. Mr. GREENISH will be happy to forward a variety of cases which have been furnished to him, where its success has been most marked, and which will serve to indicate where it may be most advantageously employed.—20, New-street, Dorset-square.

ORIGINAL LECTURES.

LECTURES ON THE
DEVELOPMENT OF THE GRAVID UTERUS.

(Concluded.)

DELIVERED AT THE

Grosvenor-Place School of Medicine,

By WILLIAM O. PRIESTLEY, M.D.

Fellow of the Royal College of Physicians, Edinburgh; one of the
Lecturers on Midwifery at the School; Physician to the Samaritan
Hospital; Physician-Accoucheur to the Marylebone
Infirmary, etc. etc.

LECTURE VIII.

BEFORE terminating this section of the course, I wish to direct your attention to the condition of the uterus after delivery, and the changes which it undergoes after being emptied of its contents at the end of gestation. The investigation of these matters has latterly occupied many able Physicians and pathologists, and it is now generally believed that an accurate knowledge of the physiological changes which take place in the womb and its appendages during puerperal convalescence, is essential to a proper elucidation of pathological phenomena connected with this period.

Immediately after the act of parturition, the womb contracts in its entire dimensions, and may be felt hard and resisting, like a cricket-ball, through the abdominal parietes in the hypogastric region. At this period it is many times larger than the unimpregnated uterus, and presents, indeed, very different characters; but examine it two or three months after birth has taken place, and, although it may remain permanently enlarged in slight degree over the virgin womb, yet it will be found in most particulars to have returned to its pristine form and structure, weighing from one and a-half to two ounces, having a cavity little more than two and a-half inches long, and being lined with as smooth and perfect a mucous membrane as before pregnancy existed.

Let us inquire, first, into the condition of the inner surface of the uterus after delivery.

You are already aware that the decidua uteri, or outer envelope of the fetus *in utero*, is a membrane of uterine origin, and really consists of the altered and hypertrophied mucous lamina which lines the interior of the womb. You are also aware that this decidua or altered mucous lamina is a caducous membrane, and is expelled as part of the secundines at the termination of labour. The questions, therefore, naturally present themselves,—What is the state of the inner surface of the uterus, after delivery? and by what reparative process does it regain the condition of the unimpregnated organ?

In reviewing the opinions of various authorities on these points, one is particularly struck by the amount of discrepancy existing among them, and the entirely opposite conclusions arrived at. William Hunter's opinion was, that at the time of delivery only a portion of the mucous lamina (that is, decidua) is thrown off with the secundines, a deeper stratum always remaining attached to the muscular coat as a protection to the interior of the organ; and this deeper stratum ultimately dissolving and coming away with the lochia. On the other hand, M. Cruveilhier, in his beautiful work on Pathological Anatomy, enunciates the doctrine that the larger portion of the uterus is entirely denuded of its inner covering. As he expresses it, "except just at the inner surface of the cervix uteri, there is no mucous membrane at all, but the muscular tissue of the uterus is everywhere exposed. This, therefore, like the stump, is to be covered by a new membrane." Proceeding further with the analogy between the condition of the uterus after delivery, and a stump after surgical amputation, M. Cruveilhier teaches that the gaping veins at the placental spot are like the open-mouthed vessels of an amputated limb, and that the reparative process is associated with local inflammation of the organ,—a false membrane being thrown over the surface previous to the formation of a new mucous membrane.

Several writers on puerperal fever, relying on M. Cruveilhier's statement, have drawn a parallel between the puerperal and surgical patient, both presenting a large open wound, with bare muscular substance exposed to

external agencies, and both, therefore, being liable to the attendant dangers of such a condition. Dr. Ferguson (from whose learned Essay on Puerperal Fever I have transcribed the preceding passage from M. Cruveilhier), concurs generally in M. Cruveilhier's description, but is inclined to think it somewhat exaggerated, and points out that the analogy drawn between the uterus and a stump so far fails, as that there is no solution of muscular continuity; and in one instance he personally examined, only the placental spot was denuded of mucous membrane, the remainder being covered by it, but much modified and changed. Dr. Rigby and others quote Cruveilhier's statement with approval, and Professor Simpson, in showing the analogy between puerperal and surgical fever, has taken its correctness for granted. In an essay of great practical value, he has shown that not only is there analogy between the anatomical conditions, the morbid lesions and symptoms of puerperal and surgical fever, but that, under certain conditions, the one may produce the other.

Quite recently Dr. Heschl, of Bonn, has published a paper "on the conduct of the uterus after delivery," which has attracted much attention, and which has been translated by Dr. Robert McDonnell, of Dublin. Like M. Cruveilhier, Dr. Heschl expressly asserts that, except at the cervix, the mucous membrane is entirely thrown off at delivery, and the muscular substance is everywhere bare and exposed. Dr. Matthews Duncan, again, entirely dissents from the assertions of M. Cruveilhier and Dr. Heschl, as to the muscular substance being exposed. In several excellent contributions on this subject, he states his conviction, based on personal observation, that the mucous coat is never after a normal labour so far removed as to lay bare the muscular fibres. He further states, what is not quite in unison with my own observation, that "the residuary decidua forms the mucous lining of the uterus," fulfils all the functions of a mucous membrane, and is not shed off, as William Hunter supposed, except "in the regular insensible exfoliation of such structures." Dr. Chisholm, of Dumfries, in contributions to the *Edinburgh Medical Journal*, describes dissections undertaken by himself, both on the uteri of lower animals, and in the human subject. He also arrives at the conclusion that in none is the muscular coat exposed after delivery, and asserts that in all he was able to demonstrate the follicular apertures of the mucous lamina which remained on the interior of the womb. It very naturally occurs, in the first place, to inquire, how is it, if the doctrine propounded by M. Cruveilhier and Dr. Heschl be correct, that in the ordinary course of things, when no epidemic influence prevails, the proportion of deaths after delivery is so small, compared with the mortality after amputations under like circumstances? And, secondly, if so large a wound is made in the interior of the uterus by the entire removal of its mucous membrane, how is it reproduced so perfectly and speedily, and without any remaining appearance of cicatrization? In reference to the last point, Heschl indeed asserts that a day or two after delivery the process of reconstruction commences from the mucous membrane remaining on the cervix; or, if this does not exist, then from the exterior of the os by the extension of a firm net-work, which gradually spreads over the whole uterus. This explanation, however, seems by no means sufficient, and is not borne out by the results of other observers.

I have repeatedly had opportunities of examining the uterus after delivery, and the following description taken at the post-mortem examination of a primiparous woman who died the day after a very severe labour, applies pretty closely to the majority of instances I have examined under similar circumstances:—

The uterus was contracted to about the size of a man's fist; its cavity was nearly 7 inches long; its walls were thicker than in the unimpregnated condition of the organ, and looser and softer in texture; the veins were very large and numerous but generally empty; the os uteri was irregularly ecchymosed, and its mucous membrane fissured; the internal surface of the uterus was covered everywhere with dark coagulated blood, but on carefully removing this and passing over the preparation a gentle stream of water, the uterine parietes were exposed. The interior of the uterus might then be described as consisting of three portions, each presenting different appearances. One portion near the fundus, equal to about a third of the whole, was recognised as the placental spot. It was more or less circular in form, slightly elevated above the

rest, and darker in colour; its surface was lacerated and uneven, and shreds of tissue floated loosely out from it when placed in water. The orifices of the vessels which conveyed maternal blood to and from the placenta, and which were torn across in its separation were readily distinguishable; dark clots plugging them and projecting into the uterine cavity.

The second portion comprehended the remainder of the inner plane of the uterus as far downwards as a line corresponding to the os uteri internum; and the third lay between this and the os uteri externum. The former of these divisions had a reddish colour, was everywhere irregular as though torn, and when the organ was immersed in water exhibited innumerable flocculent processes or shreds attached to it, similar to those on the placental spot, indicating the recent tearing off of a superimposed layer. Here and there could be seen bundles of muscular fibres, not unlike the columnæ carneæ of the heart, elevated above the surface, and sometimes quite smooth in outline as though bereft of all covering. No vascular apertures were visible here as over the placental spot, nor was it possible to detect any of the pits or depressions indicating the follicular apertures. The flocculent processes from both the above-described divisions were found under the microscope to consist of fibro-cellular structures, largely mixed with fat granules, identical in form with those composing the deep layers of the decidua uteri in the later months of pregnancy. None of the floating shreds consisted of lacerated bundles of muscular fibres, and even where muscular columns projected above the surface and were apparently denuded, a delicate investing layer of nucleated particles was invariably present. That portion of the interior corresponding to the cervix uteri and bounded by the os uteri externum and os uteri internum respectively, presented very different characters to either of the portions yet described. Here was a mucous membrane as distinct as before pregnancy commenced; its rugæ were, however, unfolded, only slight traces of the arbor vitæ being discoverable, and lacerations appeared here and there, but in other respects it was unchanged and uninjured. A copious viscid secretion covered the surface, and the mucous follicles were detected even with the naked eye. The epithelium forming the membrane was traced as a continuous layer to the commencement of the body of the uterus, where it encountered the flocculent remains of the decidua and seemed to terminate.

I have little hesitation, therefore, in affirming that after an ordinary labour the muscular substance is not laid bare, as erroneously asserted by some of the authors quoted; and that the shreds or flocculent processes observed hanging from the inner surface of the uterus are not muscular bundles, but really the remains of the decidua uteri, a stratum of which is left to protect the interior of the cavity until the mucous membrane is reproduced, when it breaks up and passes away in particles with the lochial discharge. So far as my observation goes, the stratum of decidua left on the uterine surface is essentially different in structure from the mucous membrane out of which it was formed originally, being composed of fibres and irregular cells mixed with fat globules, instead of the regular epithelium particles of a mucous lamina. Schroeder Van der Kolk has traced the gradual shedding off of this layer of the decidua in the days subsequent to delivery, and he found that the large fibres which entered largely into its composition and which he was able to distinguish from the uterine muscular fibres by their softer outline, undergo fatty degeneration, and by this process are resolved in small fragments, and thus mingle with the discharges. The large admixture of blood globules gives the sanæous appearance to the lochiæ in the early days of convalescence; but later, when the blood globules are less in number, an almost purulent appearance is produced by the cellular and fatty debris, resulting from the disintegration of the residuary decidua, and these constitute the chief part of the discharge. The mucous membrane of the cervix uteri contributing nothing to the formation of the decidua, is found almost unchanged at the end of gestation.

It remains to enquire by what process is the mucous membrane reproduced and the cavity of the womb restored to the condition of the unimpregnated organ? In 1848 M. Robin published some researches, in the *Archives Gen. de Médecine* on the mucous membrane of the uterus, which have thrown much light on the subject. M. Robin in the first place draws attention to a thesis written by M.

Collin, the object of which was to point out that the muscular substance is not denuded after separation of the membranes, and that the layer described by some authorities as pseudo-membranous or inflammatory in origin, found lining the interior of the uterus after delivery, is really a normal product, and consists of the deeper lamina of the original mucous membrane. Admitting the accuracy of this description, M. Robin proceeds to show that M. Collin has not understood the physiological significance of the layer thus described as lining the uterus after parturition. According to M. Robin, indeed, this lamina is not a portion of the original mucous membrane, which took part in the formation of the decidua,—this is thrown off at the time of labour,—but it consists of an entirely new-formed mucous membrane, the first traces of which may be observed about the fourth month of pregnancy, and it continues to increase little by little to the end of gestation, when it takes the place and assumes the function of the pre-existing layer. Kilian has confirmed M. Robin's statement by observing the same peculiarity of development in the pregnant uteri of dogs and rabbits; and personal researches in the human subject have convinced me of the accuracy of M. Robin's investigations concerning the formation of a new mucous membrane in the latter half of gestation, although I cannot concede that the decidua is entirely removed at the time of labour. In the uterus of a woman who died a few hours after abortion, at the end of the fifth month, I found under the remains of the decidua minute cell particles, like irregular nuclei, everywhere spread over the muscular substance, and these nuclei had the same characters as embryonic epithelium beneath the more mature layers of mucous membranes generally. But more distinct evidence on this point is afforded by the following observation:—A woman in the last month of pregnancy died suddenly in the Edinburgh Maternity Hospital; and my friend Dr. Keiller, who had charge of the case, gave me an opportunity of examining the uterus, the membranes being yet adherent to the uterine walls. I made thin sections with a sharp pair of scissors continuously through both membranes and uterine walls, and then carefully spread out the section for the microscope. The facility with which separation occurred showed at once the line of demarcation between the membranes and uterine walls, and in most sections thus prepared I was able to demonstrate a layer of nucleated particles, subtended by delicate fibrous tissue, lying between the muscular fibres and the decidua, and remaining adherent to the uterine wall when the membranes were

FIG. 24.

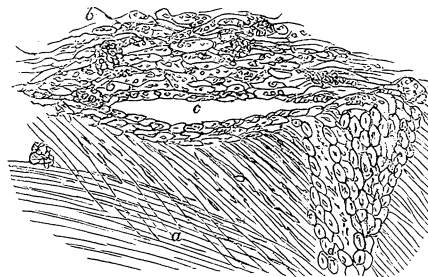

FIG. 24.—A section through the membranes into the uterine parietes in the last month of pregnancy; *a*, Uterine tissue with a layer of nucleated particles on its surface, and glandular follicles penetrating its substance; *b*, The decidua, its tissues loaded with fat granules; *c*, A space showing the line of separation of the decidua from the uterine walls, leaving the layer of nucleated particles attached to the latter.

removed. This nucleated layer did not seem to me to be continuous over the surface, but was interrupted here and there by projections of fibrous tissue from beneath, which perforated it, and mingled with the decidua structure, thus forming points of attachment to retain the membranes *in situ*. Its component particles were clear and transparent, and formed a contrast to those of the decidua lying immediately upon it, which were loaded with fat granules. In several preparations appeared sections of gland follicles of great length, which penetrated deeply into the uterine substance. Two or three canals of this kind were sometimes grouped together, and their cell particles were entirely unaffected by atheromatous change. It is thus to be observed, that not only is a layer of young mucous membrane formed between the decidua and muscular coat of the uterus, but there are present also tubular follicles deeply planted in the uterine substance, which do not separate with

the membranes, but remain as centres of reproduction to assist in spreading a thick secretion of epithelium over the surface of the uterus, when occasion requires.

The mode in which the uterine mucous membrane is further developed after parturition, is illustrated by the following description taken at the post-mortem examination of a patient who died on the seventh day after delivery from disease unconnected with her confinement:—The internal surface of the uterus was somewhat less irregular than that observed in the woman who died the day after her confinement, but fragmentary portions of the decidua mixed with blood corpuscles and fat globules were everywhere present, and the placental spot, though somewhat more contracted, was prominent and well-marked. It was especially remarked, however, that the shreds of the decidua were less firmly attached than at the earlier period, and so loose that they were readily brushed from the surface. Immediately beneath was now spread a pulpy layer, about the consistence of a jelly, which consisted of epithelial nucleated cells more or less spheroidal in form, and sparingly mixed with fat granules. The remains of the decidua were somewhat more firmly united to the placental spot, but even here the pulpy membrane was developing itself in meshes between the still noticeable but now contracted vascular orifices. The summary of conclusions may be stated as follows:—

1. After an ordinary labour, terminating in separation and expulsion of the secundines, the muscular substance of the uterus is nowhere laid bare, as some authors have supposed, nor is there any inflammatory false membrane spread over the surface. As Dr. Duncan has correctly pointed out, the interior of the uterus after parturition only bears analogy with the stump after amputation, inasmuch as both have large open vessels liable to be inflamed and to absorb noxious materials.

2. When the membranes are thrown off in the third stage of labour, a portion of the decidua remains attached to the uterine surface as a protection against external agencies. It is not, however, strictly correct to assert that original mucous membrane may be found everywhere lining the interior of the uterus after delivery; this is true only with regard to the cervix. The mucous membrane of the body, and fundus of the womb, were transformed into decidual structures at the commencement of pregnancy, and the lamina of decidua found covering the interior of the uterus after delivery, has not the texture, nor can it fulfil the functions of a mucous membrane, but consists of an arrangement of cells, fibres, and fat granules, identical with that recognised in the decidua in the later period of pregnancy.

3. The new mucous membrane begins to be formed in the later months of pregnancy between the decidua and muscular coat. It undergoes a rapid development after the uterus is emptied of its contents; and as it is gradually perfected, it assumes the function of the original mucous coat. The remains of the decidua undergo further fatty change, and are slowly shed off to mingle with the lochial discharge.

In cases where dysmenorrhœal casts and early ova are expelled from the uterus, the conversion of the mucous membrane into decidual structures is probably less complete, and the deep stratum remains behind to prevent the denudation of the muscular coat.

The diminution in the size and weight of the uterus after parturition is due mainly to atrophy of the muscular coat, or uterine tissue proper. The physiological process by which this is effected is peculiarly interesting, not only in its direct relation to the involution of the uterus itself, but also because it seems to be strictly analogous to a process of atrophy occurring in other organs as a pathological condition. Exactly as we have fatty degeneration occurring in the heart and voluntary muscles as a disease attended with wasting of substance and serious impairment of function, so in the uterus after delivery have we fatty degeneration set up in its muscular fibres, and their subsequent absorption as a normal process. It is doubtful whether the fatty change, as it occurs, for instance, in the voluntary muscles of the body, is to be regarded in itself as a form of disease leading to atrophy and impairment of function; or, on the other hand, looked upon simply as a degeneration subsequent to the loss of function—nature adopting this mode of removing what is effete and useless. But in the uterus, after delivery, we can trace the order of the phenomena, and satisfy ourselves that normally the cessation of function comes first. It is not until the muscular fibres have

ceased to fulfil their purpose, that the fatty transformation ensues; but the end being accomplished for which they were developed, molecular disintegration reduces them to the form in which they can be absorbed by the vessels, and thus carried into the general circulation. Professor Retzius has remarked that the blood contains a larger quantity of molecular fat in the puerperal patient than in the non-puerperal one, and it deserves to be remarked that this increase corresponds with the new demands on the circulatory fluid, for the ingredients of the mammary secretion,—fat being among the most important. So complete is the solution and absorption of the colossal muscular fibres which form the pregnant uterus, that in three weeks after confinement, they are no longer to be found in any part of the organ—the middle coat now consisting of embryonic elements, similar to those which composed the uterus before pregnancy began. Some authors have not hesitated to assert that the uterus undergoes so complete a transformation into molecular fat, and is thus so entirely disintegrated and absorbed, that not a single fibre of the uterus existing previous to childbirth remains behind. The fetus of each succeeding pregnancy may thus be said to be furnished with a new uterus to sustain and protect it, which in its turn is disintegrated and absorbed. We are indebted to Professor Retzius, Drs. West, Kilian, Kölliker, and Heschl for careful details of the mode in which involution takes place. The last-mentioned author states that the transformation of the fibres does not commence before the fourth or sixth day, and not after the eighth. "In the single muscular fibres this process of decay begins at many points at once; at first the slight

FIG. 25.

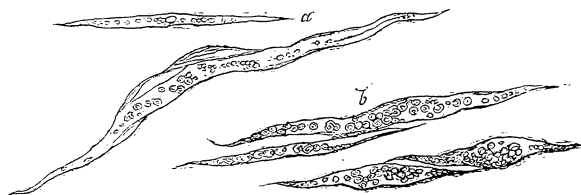

FIG. 25.—*a*. Muscular fibres of the uterus eight days after delivery. *b*. The same fourteen days to four weeks after delivery. (After Heschl.)

serpentine appearance (Fig. 25 *a*) disappears; the outline becomes pale, and there appear (often arranged in rows) yellow granules, which, where the ends of the fibre cells are thin, lead to their early dissolution. The cell (or fibre) itself (Fig. 25 *b*) is pale, but well defined, until the increasing quantity of fat granules obscures it." Speedy absorption now goes on, and rapid diminution in the weight of the organ is the result. "With the advance of the fatty transformation the uterus becomes in a corresponding degree friable, and continues so, until it has completely returned to its usual condition." The alteration produced by these changes, gives a dirty yellow colour to the uterine tissue, and is readily recognised with the naked eye. By the fourth week the uterus has nearly regained its normal volume, and Heschl found at this time the first appearance of the new uterine tissue in the body of the organ—the reconstruction being complete at the end of the second month. The new tissue is probably formed out of the nuclei of the previous muscular fibres, as well as from other stored up-germs, which were not affected by the general absorption. The substance of the cervix has seemed to me more sparingly affected by the fatty transformation than the rest of the organ, which may be accounted for by the less amount of muscular tissue and the large proportion of white fibres present. The capacity of the vessels is diminished by the same process, and probably, also, the extent of the external or peritoneal coat. The enlarged and tortuous arteries and the immensely dilated veins suffer a molecular change in the histological elements of their coats, and thus become atrophied and contracted to their original calibre.

Deviations from the usual mode in which the uterus is lessened after parturition sometimes take place, and give rise to morbid conditions. Abnormal variations of this kind occur, I believe, most frequently after abortion and miscarriage, or where the general health has become enfeebled by hæmorrhage or disease. Thus the involution may be either deficient or in excess. Drs. Montgomery and Simpson have described cases in which an arrest of involution had occurred, the womb being found, even months after delivery, much

larger than natural, and its tissue much relaxed. In such instances, the cavity may measure four to six inches long, copious menorrhagia and leucorrhœa attending, and the affection may readily be mistaken for a tumour of the uterus, or for an hypertrophied condition of that organ. I have occasionally seen at the post-mortem examination of women who had previously borne children, the uterine tissue affected by fatty degeneration, and so soft and friable that a sound passed into the uterine cavity during life, as a means of diagnosis, might readily have been pushed quite through the uterine walls, unless the greatest care were exercised in its manipulation. These are probably cases where the uterus has not been properly reconstructed after parturition—an atheromatous condition of its walls still persisting. Whether fatty degeneration in the uterine parietes ever occurs before delivery as a morbid process, has not yet been determined; but it deserves inquiry whether some cases of rupture of the uterus have not been preceded by this condition coming on prematurely, and predisposing to the accident. Lastly, the progress of uterine involution may proceed beyond the normal limits, and what has been called by Dr. Simpson "super-involution," produced. Thus the uterus is diminished below the usual proportions of the unimpregnated organ, and amenorrhœa and sterility are the result. Super-involution is met with more rarely than the so-called sub-involution of the uterus.

ORIGINAL COMMUNICATIONS.

CLINICAL MIDWIFERY.

By ROBERT LEE, M.D. F.R.S.

Obstetric Physician to St. George's Hospital.

Case 575.—On the 20th of April, 1849, I was requested by a Medical Practitioner to see a lady who was seven months pregnant, and whose abdomen was greatly enlarged. There was distinct fluctuation. On the 29th, the distension had very much increased, I passed the stiletted catheter and drew off sixteen pints of liquor amnii. On the 30th twins were still-born. "One placenta with two cords. Both fœtus had been contained in one great sac composed of decidua, chorion, and amnion, which had contained the two fœtus, and the two gallons of liquor amnii."

Case 576.—On the 27th April, 1849, I attended a lady in her first labour, who had been in a state of insanity during the latter months of pregnancy. A near relation had destroyed himself in a fit of mania. When the labour commenced the patient became altogether ungovernable, and threw herself about the bed during the pains and screamed violently. The uterine contractions were feeble and irregular, the pulse was rapid and feeble, and before the os uteri had been half dilated, it had become obvious that she would never be delivered by the natural efforts. A portion of the funis without pulsation hung through the os uteri. It was feared if the labour had been allowed to go on, that convulsions would ensue, and the operation of craniotomy was had recourse to after a consultation. The head was perforated and extracted with great difficulty, and the whole operation required unusual care, as it was impossible to preserve the patient long in the proper position. The operation of turning would not have been employed in this case even, if it had not been positively ascertained that the child was dead. The insanity gradually disappeared, and she was restored to perfect health and has since been pregnant and been safely delivered without any return of the insanity.

Case 576.—In the autumn of 1853, I was requested to visit a lady in a private Lunatic Asylum, who some time before had been seized with mania in the puerperal state, and who had remained maniacal. She had occasionally been seen by her husband, and the object of my visit was to determine whether pregnancy existed. There could be no doubt of the fact, and the patient was safely delivered without any unusual assistance at the full period in November, 1853. I was afterwards informed by her Medical attendant that "her mental condition is not at all improved at present. Some degree of interest attaches to the case (he said) from the fact of her having been insane at the time of conception, and during the whole

period of gestation, for she has been in this house 284 days and she was stated to have been insane three months before her admission." My impression now is, that this patient was ultimately restored to perfect health.

Case 577.—On September 23, 1853, I was requested to see a lady in consultation, who had disease of the lungs and insanity near the full period of her first pregnancy. Her husband and she had set out for Australia, and met with sad disasters at sea. The ship returned to Plymouth, and they were so sick, and in such a wretched condition, that they resolved to return home. The patient had been for a short time in an incoherent state, with a rapid, feeble pulse. Her condition was such that I thought it justifiable, if no improvement speedily took place, to recommend the induction of premature labour. On September 29, an unsuccessful attempt was made by her Medical attendant to rupture the membranes with the finger. He then went home for the stiletted catheter, and succeeded. A living child was born next morning, ten hours after this was done. "Good uterine contractions followed the evacuation of the liquor amnii, and the placenta was expelled, and nothing went wrong."

Case 578.—On Friday, June 13, 1856, I saw, at Sydenham, a case of violent mania in the sixth month of pregnancy. This patient had suffered from puerperal mania for some weeks after her first confinement. The question in this case was whether premature labour should be induced. The patient was in such a violent condition that it would not have been possible to have safely passed up the instrument into the uterus, and perforated the membranes, if it had been considered necessary to do this. I recommended proper restraint, shaving the head, cold lotions, leeches to the temples, and giving cathartic medicine. The symptoms gradually diminished in intensity, and I believe the patient was safely delivered, and ultimately recovered perfectly.

Case 579.—On May 8, 1849, I was called by Mr. — to see a patient in the eighth month of pregnancy, who without any apparent cause had suddenly been seized a short time before with an alarming uterine hæmorrhage; there were no labour pains, and the os uteri was little dilated, and the placenta could not be felt; it did not present. There was great faintness, and the pulse was so weak that it could not be counted. It seemed probable the case would soon terminate fatally whatever course was pursued. The membranes were immediately ruptured, and the os uteri gently dilated with the finger. While this was being done a great gush of blood took place. Turning was out of the question, from the undilated state of the os uteri, and the certainty that the child was dead by the extensive detachment of the placenta, which must have taken place to give rise to such a flooding. I opened the head, and extracted the child without loss of time; the placenta immediately followed, with an immense quantity of coagulated blood. She died some hours after, though no further loss of blood took place.

Case 580.—On May 9, 1849, I was called to a case of labour at Edward-terrace, in which the arm of the child presented and the funis without pulsation. The patient had been long in labour. The head being felt at the brim of the pelvis, it was opened and extracted with the crotchet. No attempt was made to turn the dead child. The placenta soon came away, and the patient recovered in the most favourable manner.

Case 581.—On Wednesday night, May 30, 1849, I was requested to see a lady, far advanced in pregnancy, who on the Sunday before had been seized with pain in the situation of the right kidney, and on the Monday blood had escaped with the urine. On Wednesday the catheter was passed by her Medical attendant, and the urine was largely mixed with blood. Tenderness continued in the situation of the right kidney. Pulse quiet; not much fever; no symptom of labour. Eighteen leeches were applied. Two or three days' labour supervened, and the affection gradually declined after the delivery.

Case 582.—On June 25, 1849, I was called to see a patient in George-street, Portman-square, whose first child had been delivered with the forceps. The child was dead, and she had a bad recovery. The second labour came on before the full period, and the child was expelled without any artificial assistance. She had been twenty-four hours in her third labour, when I was called to determine whether it was safe to allow the labour to continue longer. The meconium was

passing, and there was every reason to believe that the child was not alive, the head was jammed in the brim of the pelvis. The operation of craniotomy was performed, and the patient recovered without an unfavourable symptom. In the next pregnancy at the seven and a-half month, I recommended her Medical attendant to induce premature labour.

Case 583.—On July 5, 1849, I was requested to see a lady who had been long in labour, upwards of thirty hours, with her first child. The child had been dead some time, and she was completely exhausted; she was safely delivered with the perforator and crotchet. The cuticle of the child was peeling off. The placenta being retained beyond the usual period, the hand was introduced, and it was removed, but with difficulty, and hæmorrhage, to some extent, followed.

(To be continued.)

OFFICIAL REPORT OF THE LAST ILLNESS OF HIS MAJESTY KING OSCAR THE FIRST, OF SWEDEN, AND OF THE POST-MORTEM EXAMINATION OF THE BODY.

Translated from the Original

By WILLIAM DANIEL MOORE, M.B.

Of Trinity College, Dublin; Honorary Member of the Swedish and
Norwegian Medical Societies.

THE examination of the body of the late King of Sweden took place, by command of his present Majesty, Charles the Fifteenth, at the Palace of Stockholm, on the 12th of July, 1859, at ten o'clock in the forenoon. A large number of the great Officers of State, and of members of the Medical Profession, having assembled, in accordance with summonses issued by His Excellency Count Lewenhaupt, Marshal of the Kingdom, and the latter high functionary having given permission for the commencement of the business of the day, P. O. Liljewalch, First Physician in Ordinary, read the following

"Report of the last Illness of His late Majesty King Oscar the First."

"The late King was, with the exception of the chest, not strongly built; nevertheless, during the greater part of his life, he enjoyed tolerably good health. Having, as a youth, passed through a severe typhus fever, he was, in full manhood, attacked by rheumatic fever; both diseases, however, went through their ordinary course without leaving behind them any injurious consequences. His Majesty was therefore able, on ascending the throne, to devote himself, with indefatigable industry and undisturbed health, to the functions of his high calling, and this he did with a zeal indicative of the keenest sense of duty. In the commencement of each spring, however, a troublesome irregularity in the heart's action not unfrequently occurred. Still the morbid symptom was generally not of long duration, but yielded in a short time to gentle measures; and as His Majesty almost every year, during the milder season, made excursions to remote parts of the country, or to the kingdom of Norway, and most frequently did not return to the capital until late in the autumn, his system regained, through country air and the increased exercise attendant on his excursions, what it lost during the winter by hard work, often continued to a late hour of the night, combined with a more sedentary life. But in the course of the year 1851, his health became seriously implicated; the heart's action was constantly irregular, digestion was impaired, and the liver increased in size. The most important central organ of the nervous system, too, showed unmistakable traces of exhaustion, and absolutely required rest. In consequence of this, His Majesty repaired, in the summer of 1852, to the Baths of Kissingen, and at the end of his stay at that watering-place made a tour in Switzerland, returning to Sweden in the autumn, cured of his liver complaint, and with his health in other respects also improved. But now his paternal heart was smitten with the sad loss of a beloved son, and in a short time the Royal parent lay on the sick-bed, suffering from the same disease which had opened the grave for his bitterly-lamented child. A particularly tedious typhoid fever now for many weeks threatened his Majesty's life, but finally termi-

nated in convalescence, which, although slow, gave hopes of a future complete restoration to health. These expectations were, to a certain extent, fulfilled, and would, no doubt, have been completely so, had not the political circumstances of the time laid too strong a claim upon his Majesty's exertions, and determined him to neglect the care of his own person, in order to devote himself wholly to the protection of the interests of the two nations, whose welfare constituted the highest object of his sense of duty. The over-exertion of the mind to which his Majesty consequently subjected himself, the omission or curtailment of his summer tours, and the neglect of a necessary visit to the baths, at last told upon him, and in the beginning of 1857 his health again began to give way in a manner calculated to cause great uneasiness, with evident congestion of blood to the head. The lower extremities, the muscles of which were always weak, began to totter under the weight of the body, and at the same time that the power of combination for the motions of these parts was impaired, his Majesty was troubled with vertigo, particularly accompanying the movements of the head, and with vomiting, which symptoms, in combination with diminution of strength and the occurrence of involuntary muscular spasms, indicated the existence of a more deeply-seated affection, probably a softening in the central nervous system. Incapacity to discharge his Royal functions now brought on a deep melancholy, and his Majesty even in the commencement of his illness expressed his conviction of its incurability. Although this conviction could not, unfortunately, but be participated in by those who were privileged to be his Majesty's Physicians, we did not at that time consider it our duty publicly to express it. The means employed to combat the disease were, moreover, without any essential efficacy; the paralysis, which commenced in the lower extremities, gradually increased, and after the King, feeling his inability any longer to fill the high position to which Providence had called him, transferred into the hands of his then Royal Highness the Crown Prince the Government of the United Kingdom, his deep melancholy gave way to a progressive indifference, even for those things which in his health he had regarded with the most lively interest. The disease henceforward progressed slowly towards its end, and the paralysis began so steadily to extend to the other voluntary muscles, that towards the end of last June both lower and upper extremities, and the sphincters of the excretory passages were almost entirely paralysed, while involuntary spasms from time to time agitated the right leg. The appetite, too, had now disappeared, and, although digestion continued undisturbed, the body had greatly emaciated, while the hitherto superficial bed-sores, which had often been nearly healed, and had already existed more than six months without causing any great pain, began to extend and to assume a gangrenous appearance. Under all this the patient's strength gradually sank; the power of speech, previously very limited, latterly was altogether lost; the lungs filled with mucous, which, in consequence of incipient paralysis of the muscles of respiration, could only with increased difficulty be expectorated; and on the 8th of July, at eight o'clock in the morning, his Majesty quietly expired, supported in the arms of his Royal Consort, who during his more than two years' illness never left his side, and surrounded by all the other members of the Royal Family, kneeling with her and weeping bitterly around the death-bed of the never-to-be-forgotten and long-tried head of their illustrious House.

"The first trace of the nervous disease, the development of which I have now described, and which brought the late King to the grave, manifested itself long since, although it was not until within the last six or eight years of his Majesty's life, that, as we have seen, it occurred with more definite, and at last with such threatening symptoms. No one who had the good fortune to approach his Majesty's person, and who had an opportunity of observing him during a long period in his daily intercourse, could avoid being amazed at the very extraordinary power his Majesty always exhibited of retaining in his memory the most varied details, or could cease admiring the rapid apprehension, the unerring judgment, and the singular clearness of statement which were exhibited whenever he spoke. But at the same time he would not fail to recollect how his Majesty sometimes in the middle of a conversation to which he was directing all his attention, would of a sudden appear to be abstracted, and would really transfer his thoughts to some other subject on which, unless he might be disturbed, he would allow them to rest, usually

only for a few moments, but sometimes for many minutes; after which the conversation would be resumed, as if it had not been interrupted. The peculiar expression of his Majesty's features, particularly his look assumed on such occasions, and the spasmodic state, or the involuntary movements which at the same time took place in one or other part of the muscular system, render it probable that this distraction, which at times was of frequent recurrence, was due to an incipient affection of the central organ of thought. This symptom, referrible to the most important organ of the nervous system, was of late years accompanied, as has already been mentioned, with increasing weakness in the muscles of the lower extremities, and with uncertainty in the combination of movement, probably depending on a commencing organic change, either in the organ alone, on which the power of motion depends, or also in that by which the harmonisation of movements is effected. The anatomical investigation which is now about to be made will show, whether any discoverable change of structure exists in the central parts of the nervous system, or whether the disturbance of function has taken place, without the naked eye being able to detect the seat or nature of the change, which must be supposed to be present, when the function of the organ is deranged. This examination ought also to demonstrate what morbid change has taken place in the structure of the heart, as a cause of the irregular movements to which this organ was occasionally subject.

"Before I close this brief report of the late King's last illness, I ought to observe that Professors Huss and Malmsten took part in the treatment from the commencement of the disease, and that Professors Conradi and Heiberg were called into consultation from the kingdom of Norway, as Professor Faye, the Norwegian Physician in Ordinary of his late Majesty, was at the time on an extended foreign tour. It should likewise be mentioned, that the treatment of his Majesty's disease was, during two months of last year, intrusted to Dr. Kuylenstjerna, to ascertain whether animal magnetism [!] might not have some beneficial influence, after the attendant Physicians had stated that the restoration of his Majesty's health lay beyond the power of art.

"P. O. LILJEWALCH,

"First Physician in Ordinary to his late Majesty King Oscar.

"Stockholm, July 12, 1859."

As a preparatory step, the Royal remains were, with a view to prevent decomposition, on the 9th of July, at one o'clock in the afternoon, injected with an arsenical solution. The following observations were on that occasion made as to the

"*External Appearance of the Body.*"

"The Royal corpse, which was at once recognised by all present, and the features of which presented a tranquil expression, was found laid on a table in the late King's bed-chamber.

"Cadaveric rigidity existed only in the joints of the right knee and foot, and in the under jaw.

"The whole body was greatly emaciated. The tuberosities of the long bones and ribs, and the spinous processes of the vertebral column were prominent.

"Over the entire back and the upper part of the posterior surface of the thigh were slightly livid spots.

"On the left side of the nose, about an inch and a-half from its point, and close to its dorsum, was a small abrasion, said to have occurred after death in the removal of a cast of the face.

"On the front of the legs (*antierura*), but chiefly on the left limb, were found some light brown spots, varying from the size of a pin's head to that of a pea. These spots were in some places distinct, in others they were confluent, and were not raised above the surface of the skin.

"On the right side, over the lower edge of the sacrum, towards the anus, was an oval dark brown spot, an inch in length, and above it and continuous with it was a yellowish, somewhat larger, semilunar, similar spot, both together forming the mark of an imperfectly-healed bed-sore.

"On the left side, in a spot corresponding to that just described, was a bed-sore three inches in length by two in breadth, on which the slough still remained.

"Over the right os ilium, about at its junction with the sacrum, was a superficial abrasion, three-quarters of an inch in length, and on the spinous processes of the seven inferior vertebrae (lumbar and dorsal), were similar, but still smaller abrasions.

"After the foregoing inspection, the left carotid artery was opened, and into it was injected, towards the heart, about a pound and a-quarter of finely elutriated arsenic, four pounds of distilled water, and five pounds of rectified spirit of turpentine, impregnated with essential oils. The incision made in the skin was then united, and the Royal corpse was replaced in bed.

"In fidem protocelli,

"DR. A. HILARION WISTRAND."

The foregoing having been read, the post-mortem examination was made on July 12, by Professor Baron von Düben, assisted by Professor Santesson and Prosector Lovén.

With respect to external appearances, the following additional observation was made:—

"The Royal corpse has not during the last few days undergone any other change than the formation on the anterior surface of the right shoulder of some reticulated, greyish brown spots (*vibices*).

"The slough on the bed-sore already referred to, on the left side over the sacrum, is found on incision to extend in the centre to the depth of one and a-half lines, and at the edges to the depth of one line; while the cutis vera, as well as the subjacent adipose tissue is, to a certain extent, infiltrated with blood.

"*Inspection of the Internal Parts.*"

"*Head.*—The scalp is pale and deficient in blood. The cranium is thin, with very little, almost no medullary substance; its inner layer exhibits deep impressions left by the vessels and *glandulae acchioni*, rendering the skull in some places very transparent. Small, fine osseous granulations are found in the course of the vessels on the inside of the cranium (*osteophytes*).

"The dura mater is strongly adherent to the inside of the skull; it is everywhere thickened, particularly towards the falx cerebri, and is adherent to the arachnoid and pia mater in the course of the longitudinal sinus. After the separation of the dura mater, the cerebral mass swells out and exhibits the arachnoid and pia mater tolerably full of blood and healthy, with the exception of a somewhat thicker edge along the longitudinal sulcus, whence on both sides proceed numerous Pacchionian granulations.

"The convolutions of the cerebrum are flattened, so that the sulci between them are almost wholly effaced.

"The colour of the cerebral mass on the surface is pale grey with a slight tinge of red. On pressure over the lateral ventricles, evident fluctuation is felt. On section the cerebral mass appears of a greyish white colour, and is tolerably copiously studded with sanguineous dots.

"The lateral ventricles together contain rather less than three ounces of somewhat turbid serum; they are considerably dilated, particularly the posterior cornua. Their inner investment, with two or three lines of the adjoining cerebral mass, is softened and pale, resembling coagulated milk (*emollitio alba*).

"In the posterior hemispheres of the cerebrum this white softening extends on the right side nearly an inch, on the left side nearly an inch-and-a-half, reckoning from the walls of the ventricles; forming foci of *ramollissement* on the right side of the size of a small walnut, and on the left of that of a hen's egg.

"The septum lucidum is also for the most part softened.

"The corpus callosum is likewise softened.

"The choroid plexuses are pale and compressed.

"The other parts of the cerebrum exhibit no morbid change; the blood-vessels are healthy and open.

"On taking out the cerebellum its right half is found, for the extent of more than an inch, attached to the dura mater by means of old, firm adhesions; in this part the mass of the organ is of a reddish-brown colour, and is somewhat swollen, containing a tumour of the size of a small hen's egg, which is easily distinguishable from the rest of the cerebellar mass, and on section is seen to contain a round cavity, half-an-inch in diameter, imperfectly filled with a shrivelled pale yellow, broken down, fibrinous coagulum; the cavity is surrounded by a fully organised sac of connective tissue. Around this the cerebellar mass is found, to the extent of fully half-an-inch, softened, infiltrated with blood; and on microscopic examination appears broken up and mixed with colouring matter, granular cells and corpuscles. The rest of the substance of the cerebellum is healthy.

"The pons Varolii and the medulla oblongata exhibit no morbid change.

"The inner lamina of the skull is also, at the base, rough with small osseous granulations. In the right receptaculum cerebelli, where the adhesion already mentioned existed, the dura mater is easily separable from the bone, which underneath it is found to be rather cribriform and corroded.

"In the foramen magnum, the odontoid process of the second cervical vertebra is felt to be very prominent.

"*Chest.*—The integuments of the thorax contain a layer of fat about half-an-inch thick.

"All the cartilages of the ribs, especially of the superior, are ossified.

"The thoracic viscera retain their normal relative situations.

"Each pleural sac contains about four ounces of dark red serum. Both lungs are free, distended with air, full and rich in pigment. In the apex of the left lung is a small cicatrix, slightly drawn under the surface. In other respects the lungs are perfectly sound.

"The pericardium is rather abundantly covered with fat, and contains a couple of spoonfuls of dark red serum.

"The right side of the heart is also somewhat loaded with fat, and its walls are thin and have undergone some fatty change. The valves and orifices of the right side are healthy; the papillary muscles are particularly small.

"The left ventricle is somewhat dilated; its walls are of rather less than ordinary thickness; the trabeculae and papillary muscles are thin and flat, the latter at their apices are changed into connective tissue. By this tissue the efferent tendons are partly united to one another. The mitral valves are somewhat attenuated and short, but are otherwise healthy. The semilunar valves of the aorta have undergone morbid change, the right valve being along the whole of its free margin thickened, and as it were doubled, by an excrescence one line in height, comb-like, filamentous at top, and running along the inner surface of the valve. Farthest to the right is a conical calcareous excrescence, adherent at the base, the base of which extends somewhat into the ventricle. The two other semilunar valves are joined to one another, the septum between them having almost disappeared. These valves are, moreover, considerably thickened, contracted, and somewhat convoluted. The free valve is $1\frac{1}{4}$; those which have grown together are exactly two inches in breadth. The greatest width of the left ventricle is eight inches. The aorta immediately above the valves is $4\frac{1}{2}$ inches in circumference.

"The walls of the auricles are particularly thin.

"*Cavity of the Abdomen.*—In the abdominal integuments is a considerable layer of fat, one inch in thickness.

"The peritoneum is healthy, but on each side is an external inguinal rupture, capable of admitting three fingers laid together.

"The omentum, one-sixth of an inch in thickness, covers the abdominal viscera, which occupy their normal positions, and do not exhibit any morbid adhesions.

"The stomach, almost empty, is rather thick anteriorly towards the pylorus; the mucous membrane in that part is slightly hypertrophied; the coats of the stomach are otherwise everywhere sound.

"The intestinal canal contains in its upper part thinner, in the lower part more solid mucus and brownish-green excrementitious matters; the small intestines are healthy; on their mucous membrane at the iliocecal valve, and about three inches upwards, the mouths of the glands are open, and the membrane itself is there particularly thin and clammy.

"The large intestine is throughout healthy.

"The mesentery is rigid, with a layer of fat three-quarters of an inch thick.

"The pancreas is healthy.

"The liver is very small, especially its left lobe; its substance is close and hard, but without any trace of cicatrix or cirrhotic change. The liver is 8 inches broad, 7 high, and $3\frac{1}{2}$ thick.

"The gall bladder contains about a tablespoonful of dark brown grumous bile.

"The spleen is somewhat turgid, but exhibits no morbid change.

"The kidneys are imbedded in a layer of fat a couple of inches in thickness, which extends into their pelvis; their substance is healthy. The ureters are open and healthy. The renal capsules are also healthy.

"The urinary bladder contains a couple of tablespoonfuls

of turbid urine; its walls and mucous membrane are healthy; the third lobe of the prostate gland is somewhat enlarged.

"*Cavity of the Spinal Column.*—The medulla spinalis is surrounded by a great quantity of fat, its membranes and substance are healthy. Nothing else worthy of note was observed.

"Visum, repertum,

"Stockholm, July 12, 1859."

"GUST. VON DUBEN.

The pathological changes above described, compared with the symptoms detailed in the history of the case and in the published bulletins, lead to the following conclusions as to the connexion between them:—

"1. The irregularity in the heart's action, which for many years was sometimes more, sometimes less troublesome, depended on the existence and growth of the morbid products found in the aortic valves, which, arising in the course of the rheumatic fever mentioned in the report, subsequently continued and increased, causing attenuation of the wall of the left ventricle and dilatation of its cavity. These morbid products, although discoverable by means of the stethoscope, were by the efforts of nature in time smoothened and modified, so that the heart was able to discharge its functions, although less regularly and perfectly.

"2. The distraction of mind described in the report, which was observed for many years back and was connected with more serious symptoms, subsequently developed signs of congestion of the head and diminution of strength, finds its explanation in the morbid changes of the dura mater, which, in consequence of an insidious chronic inflammation, extending likewise to the inner table of the skull, was both thickened to an unusual degree, and became adherent on the one side to the skull, and on the other to the arachnoid and pia mater, and through them to the outer surface of the superior convolutions of the brain.

"3. The extravasation of blood found in the right half of the cerebellum, which, from its character, as above described, and its effects on the subjacent bone, appears to have been of long standing, probably took place at the same time, or the commencement of the year 1857, betraying its origin by the increase of the before-mentioned cerebral symptoms, and by the supervention of vertigo and vomiting, and manifesting its continued influence in the derangement observed in the muscular movements, particularly of the lower extremities, and in the want of control over these movements.

"4. Soon after the softening, found on dissection, began to be developed in the cerebrum, the posterior lobes, the walls of lateral ventricles, the septum and corpus callosum, with consequent effusion into the ventricles and dilatation of the latter, which change was characterised in its commencement by the increasing morbid apathy, and afterwards by the progressive paralysis of the voluntary muscles, and finally of the excretory passages and the muscles of speech and respiration.

"5. Lastly, it may probably be inferred that, as no other sign of inflammation was found in the body, the recent inflammatory process, of which the results were observed around the old clot of blood in the right lobe of the cerebellum, was the cause of the feverish symptoms which occurred during the closing period of his Majesty's illness, and which were mentioned in the published bulletins. Consequently these feverish indications and the post-mortem appearances left by the inflammatory process, on which they depended, are to be regarded as the latest symptomatic and anatomical phenomena in the present case.

"Verified, ex officio,

"GUST. VON DUBEN.

"DR. A. HILARION WISTRAND."

DR. WATSON, Surgeon of the "Cormorant," is reported as "Wounded," during the late fighting in China at the mouth of the Peiho.

THE French Academy, at a late sitting, had a field-day of novelties. M. Gavariet, to begin, recommended a new apparatus of Faradisation for Medical purposes. Then M. Malgaigne proposed a novel proceeding in tracheotomy to prevent hæmorrhage. After this the new disinfecting agents were subjected to all sorts of criticisms, and by a variety of learned Academicians. And, lastly, the stethoscope of a Brazilian Doctor was warmly recommended to the attention of the Profession by M. Kergaradec.

THE LONDON
PRACTICE OF MEDICINE AND SURGERY.

THE LONDON HOSPITAL.

ANEURISM OF THE RIGHT POPLITEAL ARTERY.
— COMPRESSION TREATMENT. — SLOUGHING
OVER THE ARTERY.—LIGATURE.—RECOVERY.

(Under the care of Mr. NATHANIEL WARD.)

A COAL-WHIPPER, aged 51, was recommended as an out-patient by Mr. Arnold, of Ratcliffe, in the middle of February. He was admitted into the Hospital, and, on examination, a large pulsating tumour was found in the right ham, having all the characters of aneurism. The measurement round the limb, over the most prominent part of the tumour, an inch above the level of the upper border of the patella, exceeded that of the opposite limb in the corresponding situation by three inches. There was a well-marked "*bruit de soufflet*," and the swelling shrank considerably when pressure was made on the femoral artery. The tumour felt uniform and smooth, and not thinner in one part than another. There was cedema of the leg, the measurement round the prominent part of the right calf exceeding that round the left by one inch. The pulsation in the right posterior tibial artery was weaker than in the left.

The heart occasionally intermitted in its action, but neither aortic nor mitral bruit could be detected. The patient had been in the habit for some years of taking large quantities of beer, his face looked puffy, and there was a lax condition of the subcutaneous connective tissue over the whole of the body. He had somewhat the appearance, in fact, of a man suffering from Bright's disease. The renal secretion, however, was found natural. He had been occasionally the subject of rheumatism, and fancied that the present affection had something to do with it.

He stated that a month before his admission, the right leg was like the other, and that about a week after that he remarked the swelling in the ham, and the beating there, followed by puffiness in the leg, pain in the position of the ham-string tendons, and numbness along the upper and lower surface of the toes. He was not conscious of having received any unusual strain, although he might have done so in his laborious occupation, which he had followed for thirty years. This occupation consisted in walking up four or five steps to a stage or platform five feet from the ground, and then with several companions, jumping down backwards on the ground; this latter part of the proceeding being the means of raising from the hold of a collier, a large basket of coals, connected by a rope through a fixed pulley to other ropes, made taut in the hands of the men prior to jumping down. For ten hours a-day he had been frequently so engaged.

The patient was kept quiet in bed for a week, and during this period was placed on low diet; diuretics, and an occasional purgative being prescribed. At the end of this time the compression-treatment was commenced. He had previously received instruction as to the nature of his complaint, and the object to be effected by the treatment proposed. A meat weight and pad to the groin, and a Bigg's aneurism-compressor were alternately had recourse to; instruments which had proved successful on two previous occasions. All the preliminary measures were carefully attended to, such as shaving the hair from off the upper part of the thigh, and dusting the latter with flour, the careful fixing of the bedding and sheets, and the pad on which the affected limb rested; as also the application of a large cradle over the trunk and limbs, so as to render manipulation on the part of the Surgeon or patient as free from embarrassment as possible. This treatment was kept up for four days, never, however, at any time with pressure sufficient to stop the pulsation in the aneurism. On the fourth day the skin over the artery at the lower fourth of Scarpa's triangle, corresponding in extent to the area of the pad of the compressing instrument, looked livid and dark, and was but of a low temperature. The skin over the artery also below Poupart's ligament, and at one or two other places on which the pad of the compressor had been shifted, had esicated. The compression treatment was laid aside. The cutaneous vesications soon healed, but the integument at the

lower part of Scarpa's triangle became duller and darker; and ultimately an eschar involving the skin and soft tissues down to the sheath of the artery, separated. At the bottom of the wound thus resulting, the vessel to the extent of an inch and a-half could be felt distinctly with the finger, covered over by sloughy connective tissue. Healthy reparative action soon took place in the circumference of the wound, and the resulting granulations gradually encroached on the centre. The artery was tied in two distinct places on the fourteenth day, after the separation of the slough. An incision about an inch long was made in an upward direction from the upper limit of the wound, and a healthy portion of the sheath of the artery having been cut through, a ligature was passed beneath the vessel. A second incision, similar in extent, but directed downwards and inwards, was made from the lower limit of the wound, and the sartorius having been turned a little outwards, and another healthy portion of the sheath exposed, a second ligature was passed beneath the artery. The upper thread was then tied, and then the lower; the portion of the artery intervening between the two ligatures being about two and a-half inches in length. The incisions were brought together in the usual way, and the limb, placed on an inclined plane and slightly flexed, was enveloped in wool. The lower ligature came away on the thirteenth, and the upper on the seventeenth day, when the patient was ordered a chop and some porter daily, having previously been kept on low diet and beef-tea, without any stimulus. The entire wound in the thigh had healed in the ninth week after the operation, without any untoward symptom having supervened; the tumour in the thigh having lost all its aneurismal character, and having consolidated and shrunk to about one-sixth of its original volume. The man left the Hospital shortly afterwards, and has since resumed his laborious work.

THE LONDON AND PROVINCIAL
PRACTICE OF MEDICINE AND SURGERY.

REPORT ON AMPUTATION OF THE
PENIS FOR EPITHELIAL CANCER.

In the following series of cases we have placed together all the instances of Amputation of the Penis for Epithelial Cancer, which have been recorded from time to time in our Statistical Reports. It numbers altogether only thirty-five cases, and as the period comprises more than four years, it is evident that the operation in question is but seldom performed. Being in itself an operation attended by almost no risk, we may, however, fairly infer that it is resorted to in almost all the cases of cancer of the penis which come under care in Hospitals. The disease is one so loathsome and so painful, that patients but seldom refuse to submit to the alternative advised for their relief and probably only those are not treated by amputation of the organ in which the disease has, at the time of the Surgeon's being consulted, already advanced too far. We recollect in the course of our Hospital observation two or three such cases. In one the patient, an elderly man, was in very feeble health, and the cancerous ulcerations had already extended to the skin of the pubes, and laterally almost to the perineum. In two others the operation was declined because the glands in the groin were extensively affected.

Many of the cases in our series are very deficient as to detail; we have, however, availed ourselves of all in our possession, and as the report is statistical, we have not omitted any case, however brief might be the facts to record respecting it. As with the cases of malignant disease of the testis, so here again we have to regret that in very few instances do our notes carry us beyond the date of the patient's discharge from Hospital. If we could state how many of the patients alluded to are at present alive, the information would have a practical value of the highest kind.

GUY'S HOSPITAL.

(Under the care of Messrs. COCK, BIRKETT, and HILTON.)

Case 1.—Mr. Cock.—A man, aged 62, in good health, the subject of congenital phymosis. Cancer of the penis had

existed eighteen months, and was very extensive. Amputation of the greater part of the organ. Recovery.

Case 2.—A man in fair health was admitted, on account of epithelial cancer, complicated with phymosis. Amputation was performed, and the man recovered well.

Case 3.—Mr. Birkett amputated just behind the glans for epithelial cancer of the penis in a man aged 67. Recovered.

Case 4.—Mr. Cock operated on a case of epithelial cancer. He removed the entire prepuce, with part of the integument of the penis. The man left the Hospital with the part soundly healed.

Case 5.—A man, aged 46, in good health, under the care of Mr. Hilton, on account of epithelial cancer, affecting both the prepuce and the glans. The disease was of five months' standing. Mr. Hilton removed the organ. The man did well.

Case 6.—A farming man, under the care of Mr. Cock. He was admitted on account of epithelial cancer of the prepuce and one side of the glans. For fifteen months there had been pricking pains in the part, but the warty growths had been observed only three months. The inguinal glands were not enlarged. Mr. Cock cut away the diseased parts, including the whole prepuce and one side of the glans. The wound healed well.

Case 7.—A patient, aged 27, in good health, under the care of Mr. Hilton. The penis was removed for epithelial cancer. Recovered.

Case 8.—Mr. Cock.—A man, aged 54, admitted on account of epithelial cancer of the prepuce and skin of the penis. The diseased integuments, including the prepuce, were removed, but no part of the glans. The wound healed well.

Case 9.—A man, aged 58, under the care of Mr. Cock, on account of epithelial cancer of the penis, involving both glans and prepuce. The organ was removed.

ST. BARTHOLOMEW'S HOSPITAL.

(Under the care of Messrs. LAWRENCE, STANLEY, LLOYD, and PAGET.)

Case 10.—A man, aged 40, admitted under the care of Mr. Paget. The penis was amputated on account of epithelial cancer. Recovered.

Case 11.—A man in fair health, the subject of congenital phymosis and hypospadias was admitted under the care of Mr. Paget. Epithelial cancer had attacked the glans and foreskin. Amputation. Recovered.

Case 12.—Mr. Lawrence.—A man, aged 40, admitted for cancer. He had been previously operated on elsewhere for epithelial cancer, beginning in the prepuce. The disease had returned. The whole organ was amputated. He recovered.

Case 13.—A man, aged 42, under the care of Mr. Stanley, on account of epithelial cancer of the penis. The organ was amputated in the usual way. The patient recovered.

Case 14.—A man, admitted under the care of Mr. Lloyd for epithelial cancer. The organ was amputated through its middle. The parts healed well.

Case 15.—Mr. Lloyd.—A middle-aged man, admitted for epithelial cancer of the penis. The disease was of eight weeks' duration. A mass the size of a walnut was removed from the prepuce and the side of the glans penis. Recovered.

Case 16.—Under the care of Mr. Paget. A man, aged 39. The disease was of three years' duration, and had formed in the cicatrix of an injury received in boyhood. Amputation of the entire organ.

THE LONDON HOSPITAL.

(Under the care of Messrs. CURLING, ADAMS, and WARD.)

Case 17.—An elderly man, the subject of cancer of the penis of two years' duration, was admitted under the care of Mr. Adams. It was removed. Recovered.

Case 18.—A tall, muscular man, aged 30, was admitted under the care of Mr. Ward, for epithelial cancer, following long-standing venereal disease of the organ. He was also the subject of congenital phymosis. The prepuce was removed, and subsequently the penis. The case did well, and the patient left the Hospital in twenty-three days after the operation. About a month afterwards he was reported as gaining flesh, and in good health.

Case 19.—A man of bad constitution and very irregular life, was admitted under the care of Mr. Curling, having a large part of the penis involved in a growth of epithelial cancer. It was necessary to amputate at the very root of the organ. The incision was made a little obliquely, so as to

leave the urethra rather longer than the rest. Some gland in the groin were a little enlarged, but it was not considered advisable to remove them. The man recovered.

UNIVERSITY COLLEGE.

(Under the care of Mr. ERICHSEN.)

Case 20.—A man, aged 64, the subject of ulcerated cancer of the glans. The whole organ was removed. Recovery.

ST. MARY'S HOSPITAL.

(Under the care of Mr. COULSON.)

Case 21.—A man, aged 44; admitted on account of epithelial cancer of the glans and prepuce of two years' duration, and said to have followed an injury. Mr. Coulson removed the organ. Recovery.

ST. THOMAS'S HOSPITAL.

(Under the care of Messrs. SIMON and LE GROS CLARK.)

Case 22.—A man of middle age was admitted, under the care of Mr. Simon, for epithelial cancer of the penis. It was amputated near the root. The man recovered well as far as the operation was concerned, but died from hæmoptysis, etc., before leaving the Hospital, some months after the operation.

Case 23.—Mr. Le Gros Clark removed the penis from a man, aged 54, for epithelial cancer. The patient recovered.

VARIOUS PROVINCIAL HOSPITALS.

Case 24.—The Durham County Hospital: Mr. Green.—A healthy-looking man was admitted on account of epithelial cancer of the penis. The disease had existed two years, and was progressing. The organ was amputated in the usual manner. Recovered.

Case 25.—Durham County Hospital: Mr. Shaw.—A man, aged 36, was admitted on account of epithelial cancer of the penis. Amputation. Recovery.

Case 26.—The Leeds Infirmary: Mr. Hey.—A man, aged 48, admitted for cancer of the penis. The part affected was removed. The disease re-appeared.

Case 27.—The Leeds Infirmary: Mr. Smith.—An elderly man admitted for epithelial cancer of the penis. The glands in the groin were enlarged at the time of the operation, which was done only at the patient's urgent request. Recovered.

Case 28.—The Leeds Infirmary: Mr. Teale.—A healthy man, aged 77, was admitted for epithelial cancer of the penis. He stated that the disease had commenced twenty years back. The glands in the groin were not affected, but the urethra was obstructed, and he made water with the greatest difficulty. The entire penis was amputated. The parts healed, and the meatus remained freely open.

Case 29.—The Liverpool Royal Infirmary.—A healthy-looking man, aged 35, was admitted on account of epithelial cancer of the penis. Amputation was performed, and he recovered.

Case 30.—The Gloucester Infirmary: Mr. Wilton.—A man, aged 57, admitted for cancer of the penis. The entire organ was removed. He recovered well.

Case 31.—Royal Berkshire Hospital, Reading: Mr. May.—A healthy man, the subject of epithelial cancer of the penis. Half the organ was implicated. The disease was of eighteen months' duration. The wound had nearly healed, when, three weeks after the operation, a low form of pneumonia came on, and proved fatal in six days.

Case 32.—The North Staffordshire Infirmary: Mr. Turner.—A cachectic man, aged 46, admitted for epithelial cancer of the glans, which was removed. The patient recovered.

Case 33.—Norfolk and Norwich Hospital: Mr. Crosse.—A man, aged 67, was admitted on account of epithelial cancer of the penis, of three years' duration. He was the subject of phymosis, and only after an operation for the latter did his more serious disease become manifest. The organ was amputated, and he recovered well.

Case 34.—West Norfolk Hospital: Mr. Sayle.—A man, aged 64, by trade a baker, was admitted on account of a growth of epithelial cancer, involving the whole prepuce, and the integuments of the penis. The penis was amputated close to the pubes. The patient left the Hospital in good health, and able to pass water well.

Case 35.—The Huddersfield Infirmary: Mr. Bradshaw.—A healthy man, aged 40, admitted for epithelial cancer of the penis. The disease was of four years' standing. There was

an indurated gland in the right groin. Amputation. Recovery.

COMMENTS ON THE SERIES OF CASES.

Fatality of the Operation.—Amputation of the penis is not, under ordinary circumstances, an operation attended by any material risk to life. Of the thirty-five cases given above, all, excepting two, resulted in recovery, and in one of the latter the fatal event was in no way connected with the operation, and did not occur until three months after it. In the only one in which death *bonâ fide* resulted from the operation, it was caused by a low form of pneumonia which supervened in the fourth week. The patient had previously been a healthy man. Such results will, of course, occasionally follow all operations, even the most trivial, especially when performed in the wards of Hospitals where erysipelas, pyæmia, etc. are often rife. The risk attending amputations of the penis is probably increased slightly in proportion as the advanced stage of the disease requires that it be performed low down. When, as we have seen in one or two instances, it is required to dissect away the crura of the organ from their attachment to the bone, the danger attending it may even become considerable. In none of the cases in our present series, however, was so extensive a dissection required, and a majority of them were amputations not much below the glans.

Age most liable to Cancer of the Penis.—The age of the patient is stated in only 23 out of our cases. The oldest in the series was 77, the youngest 27. To classify them according to age,—we find one under 30, four between 30 and 40, eight between 40 and 50, four between 50 and 60, five between 60 and 70, and one between 70 and 80. Thus it would appear that middle age is the period of life most liable to this form of cancer, a circumstance to which probably several influences contribute.

Exciting Causes of Cancer of the Penis.—It has long been a matter of observation among Surgeons that congenital phymosis often acts as a localising or exciting cause of cancer of the glans. The disease is exceedingly rare in Jews. In only four of the cases in our series do the notes state that this condition of the prepuce had existed; but it must be borne in mind that no special attention was given to the reporting of the previous history of the case by those who have supplied to us the data we have used. The object alone in view was the result of the operation. Thus it is highly probable that a far larger proportion were really the subjects of phymosis. In one case it is stated that a long-standing venereal sore had preceded the malignant one, and in another, the cancerous ulceration attacked a cicatrix left by a wound in infancy.

PULSATILE TUMOUR.—M. Heyfelder is called to a Pharmacies, who had in the second right intercostal space, immediately to the right of the sternum, a small shining tumour, which appeared after two months of obscure symptoms, and was the seat of pulsations synchronous with the radial pulse. Many doctors thought it an aneurism. There was no bruit audible over it; it fluctuated, and was compressible; the skin over it was thin and ready to break; expiration increased its size, with inspiration it diminished. M. Heyfelder punctured it, and out came eight ounces of pus. He then was satisfied that he had to do with an encysted pleural abscess. In eight weeks the patient recovered. [Surely the wiser and more cautious practice here would have been to let so advanced an abscess open of its own accord. The diagnosis was happily correct in this case; but every one of our readers can doubtless call to mind cases in which the very loftiest Surgical authorities have punctured aneurisms when judging they had abscesses only to deal with.]

GRAPHITE (BLACK LEAD).—Professor B. C. Brodie, of Oxford, in a paper read before the Royal Society, "On the Atomic Weight of Graphite," arrives at the following results:—"That carbon in the form of graphite forms a system of peculiar compounds, different from any compounds of carbon yet known, and capable of being procured only from graphite; that graphite, within certain limits, functions as a distinct element, capable, indeed, of being converted, by a certain process of oxidation, into carbonic acid, and thus identifies itself with the other forms of carbon, but having a distinct atomic weight, namely 33 (hydrogen = 1)."

SATURDAY, OCTOBER 1.

GRATUITOUS MEDICAL SERVICES.

THE "Builders' Strike," as it is called, may possibly bring to the attention of many of our Profession the subject of Gratuitous Medical Relief. The readers of this Journal will recollect that we have, on more than one occasion, touched upon this subject; and we certainly shall not cease to bring it prominently forward, until we see some signs of a practical attempt made to cope with the monster evil. Surely this very Builders' Strike is only another proof of the injustice suffered by the members of our Profession through "gratuitous advice." The wages of the labouring classes have been, and still are, rapidly rising; and at the very time when these classes are more able than ever they were at any previous period to assist themselves, Hospitals and Dispensaries are springing up like mushrooms in all our large centres of commerce, to give them medicine and advice gratis. The time, we are satisfied, is fast approaching, when the Governors of Hospitals must ask themselves what is the meaning of the words, "fit and proper person to be admitted to your Charity?" And we feel bound to say, that those of our brethren who are attached to public Institutions should be the first to endeavour to abate the enormous robbery perpetrated upon the Profession by the Profession.

The system under which our public Medical charities are carried on is not only fraught with injustice to our Profession, but it is also highly demoralising in its effects upon the objects of those charities. We are not speaking chimerically, for we appeal to every Hospital Medical Officer whether he does not witness daily the purposes of the Charity prostituted for the benefit of individuals who are not entitled to them by their position. Such, indeed, is especially the case in the instance of our larger Hospitals. It is notorious that hundreds of persons who are perfectly capable of paying a Doctor apply to and obtain relief gratuitously. Who is to interfere with them? and who is to apply the test? The Physician or Surgeon who attends them knows perfectly well that they are not of a class who will come to him at his private house, and therefore is apt to overlook the fact that they are nevertheless able to pay one who takes a lesser fee. And then again, as is well understood, the authorities of Hospitals never consider themselves bound to criticise too narrowly the pretensions of patients, whether they are legitimate or otherwise. Hence, in the first place, Medical relief is given at our Hospitals gratuitously to individuals who are quite able to pay for it. In the next place, a large class of artisans and other well-to-do labourers make no provision in their days of health (as they now might readily do, with their large earnings), because they know well enough there are always abundant opportunities for them to obtain gratuitous Medical advice. But it will be said that there is a large class of individuals, who are quite incapable, even during health, of making provision against the evil day. This, of course, we readily

admit; but we say of such, that they form a class essentially of paupers, and that it is the business of the community to take charge of them. Paupers have no right to receive relief in our charitable institutions; and yet we know perfectly well that Poor-law officials force their poor by every means to seek relief at Hospitals and Dispensaries, rather than at the hands of the Union Doctor. In this way, again, our public Medical charities act most injuriously upon the interests of the veritable pauper. The harsh and cruel treatment of the pauper, the difficulties thrown in his way when he requires relief, are facts notorious to all Hospital and Dispensary Doctors. This class of patients will put up with a large amount of real misery rather than accept the aid which is given them. Now, as we see the matter, our public Medical institutions are in a great degree responsible for this state of things. If the pauper had no such refuge as the Hospital or Dispensary to fly to, the Poor-law authorities would be compelled to do him justice; but in these institutions they find an excuse for their negligence.

Are we really to suppose that our Profession will continue for ever to perpetuate this act of suicide? Is it possible that no combination for the prosecution of so legitimate a purpose as the obtaining of payment for services rendered, will ever be made by our Hospital officers? Will they consent to go on pursuing a course of manifest injustice to those of their Professional brethren who do not happen to be attached to public Charities? We cannot but think that the rise in wages which is pretty well universal in all classes of artisans, should at least be a stimulus to lead men of our Profession to think upon these things. We firmly believe that the time is arriving when we have a right to cry out in the name of justice and common sense:—Let the utter pauper be sustained by the community at large; let the mechanic, in his hour of sunshine, make provision for his hour of sickness; let Charity step in to assist him who assists himself; and let Medicine be remunerated for her services, whether bestowed upon pauper or charitably-assisted mechanic. Let there be an end of indiscriminate gratuitous Medical services. To commence this immense Reform required by the age, the first step must be an investigation into the abuses of our Public Medical Charities.

THE WEEK.

We are very glad to be able to announce that a public meeting has taken place in Woolwich, and that on this occasion the system of flogging in the army was denounced as totally inconsistent with our modern ideas of civilization.

Dr. Markham, who was on board the *Great Eastern* during her journey from London to Portland, writes to us as follows concerning the nature of the explosion which then occurred:—

"It has been stated by some of the scientific witnesses who have given evidence at the inquest recently closed at Weymouth, that, in their opinion, the explosion was caused by the decomposition of water, and the subsequent reunion of its elements. I am aware that this hypothetical and inexplicable resolution of water, when exposed to high pressure, into oxygen and hydrogen, has often been given as the explanation of steam-boiler explosions; but, I believe, no proof of the fact has ever yet been adduced. In the present instance there is no kind of evidence, or even seeming pretence, to show that any such evolution of gases, and their combination subsequently, took place. All the facts of the case go distinctly to prove, that the explosion was due, simply and solely, to the sudden escape of steam highly heated and subjected to enormous pressure. In the first place, the nature of the injuries suffered by the wretched victims of the explosion very clearly points out that steam was their cause. The men were for the most part injured in those parts of the body only which were exposed and

uncovered, viz., on the breasts, back, and belly, and in one or two instances—where the men had no stockings on, and had tucked up their trowsers—on the legs. There can be no doubt that the men saved their faces to some extent, by putting their hands over them. Mr. Briscoe, one of the head engineers, is said to have saved himself by having thrown himself flat on the floor of the engine-room; but, I believe, that in his case he was saved from injury chiefly by the fact that he had his ordinary clothes on; this I infer from the circumstance, that he was much scalded on his hands with which he guarded his face as he lay on the ground. That the whole of the water in the *steam-jacket* was converted into steam seems pretty clear from the fact that there were nowhere any signs of water having been dashed about, nor as far as I can remember were any of the men's trowsers, etc., wetted by it. The scalding, therefore, of these poor fellows was almost solely caused by the highly-heated steam; in one or two instances, perhaps, the hot air and ashes which were driven down back through the furnaces at the moment of the explosion might have assisted in producing the injuries. Some of the men also suffered greatly from the effects of the sulphurous vapours, etc., to which they were exposed through a similar cause. If the explosion had taken place through the union of oxygen and hydrogen, there must have been at the moment a fearful degree of heat and flame produced, such as could have scarcely failed to have set fire to the immense *débris* of inflammable materials which lay around the scene of the explosion; and the men also could hardly fail to have been severely *scorched*, and the clothes they had on to have been burnt. But nothing of this sort occurred; neither was any violent detonation (such as the union of those gases could necessitate) heard, *nor any flame seen*. Besides, for some short period after the explosion, the ship was from one end to the other filled and covered with steam, showing clearly the enormous quantity of it, which had formed in the super-heating *steam-jacket*, under enormous pressure. The statement, therefore, made (as reported) by the Government agent, about the formation and recombination of hydrogen and oxygen is an ill-founded hypothesis."

The only relic, belonging to any member of our Profession, which has been found by the last Arctic searchers for Sir John Franklin and his crew, was a silver medal obtained by Mr. McDonald as a prize for superior attainments at a Medical examination in Edinburgh, April, 1838. We believe that among the gentlemen who have thus sadly perished, there is numbered a brother of Professor Goodsir, of Edinburgh. He was Assistant-Surgeon and Naturalist to the Expedition; and though young, had already given proofs of his love of Science, and devotion to his Profession.

M. Renault, Director of the School at Alfort, has placed under the eyes, or rather the noses, of the Academicians, specimens of faecal matter, which had been treated with a mixture of clay and coal-tar. The matter, hard and concrete, had lost all special odour, keeping only that of tar. Unfortunately, the matter thus treated, appears useless for agricultural purposes. The great hygienic question of the day, in French mad-houses and prisons, is their *fosses d'aisances*. M. Ferrus says, that all attempts hitherto made in the way of disinfecting, or of removing the faecal matter by streams of water, have been unsatisfactory. He is, therefore, driven to propose a very primitive means of its removal, viz.: moveable receptacles—*des fosses mobiles*—which are at present used in many Parisian houses: the matters being thus daily removed.

If we are to trust to rumours and demi-statements, which from time to time appear in the public journals, we shall be led to suspect, that there is going on amongst us, on something of an extensive scale, what may be termed a "Massacre of the Innocents." Our attention has been particularly called to this subject, in consequence of what transpired at the last

weekly meeting of the Poor-law Guardians of St. Marylebone. Our Profession is closely interested in the matter, and if the facts averred be, indeed, true, and means taken to remedy them, it is clear, that it is through the hands of the Profession that the remedy must come. The Coroner of Middlesex observed a short time ago at an inquest held in St. Prancras:—"That he felt surprised that such a number of still-born children should be sent to the different workhouses in the metropolis, and without any investigation buried in the coffins of adult paupers. When that was done, could there be any wonder at all of the number of child murders reported from time to time? He should attribute it to the carelessness in the want of some proper authority, having a check upon the burial of such children." And this induced one of the Marylebone Guardians to inquire what was done in his own parish. He found that still-born children were received on the certificate of a Medical man, or a midwife; but that these certificates were often of a very doubtful character, as he did not know whether those who signed them really were or not what they represented themselves to be. And it appeared also, that since the 1st of January of the present year, ninety-three still-born children had been thus brought to the workhouse for interment; and that in some cases there was so much doubt about the case, that the assistant overseer had refused to receive the child. The remedy for this disgraceful state of things is clear and simple. No still-born child ought to be buried without the production of a certificate from a duly-qualified person. Our readers may perhaps remember, that we lately called attention to the fact, that a similar increase of the number of still-born had been going on of late years in Paris, and that an enthusiastic Physician had attributed the circumstance to the very common use of ergot of rye in labours. We shall again recur to this subject, and shall closely watch the proceedings of the authorities in reference to it.

The Twenty-ninth Annual Meeting of the British Association was opened on the 14th ult. The hall where the meeting was held was crowded with notabilities and fashionables. The business commenced at 8.30 in the evening. Professor Owen, the President for the past year, made a few remarks and then vacated his office, whereupon His Royal Highness Prince Albert took the Chair, amidst (of course) enthusiastic applause; and delivered an address, which has met with general approbation. To this, and to other proceedings of the learned body, we shall elsewhere refer.

A protest from the Homœopaths of Birmingham has been forwarded to us. These gentlemen are in arms and witty (by the aid of Molière), because the Medical Registration Association of Birmingham has resolved that its body shall not contain irregular Practitioners. The complaint contained in the protest, we need hardly say, is the old tune piped over again. We certainly shall not interfere with its harmonic strains, having so often said all that reason can say upon the subject. Only this we would observe, that we congratulate the Registration Association upon its wise resolution. As we have again and again endeavoured to impress upon the Profession, these unnatural offsprings of legitimate Medicine are parasites who live only on the credit and honour of the Profession which they have forsaken, and, therefore, it is an especial duty to have no Professional communion with men who assert that our black is white, and our white black. Don't interfere with them—let them have free play to sport over that excellent well-stocked preserve of Empirics—human credulity. Let them there display the glories of their system, and reap a golden harvest. But surely we may in turn request

them not to interfere with us; surely we may, legitimately and in all honesty, refuse to admit amongst us a class of men who practise a system (as they call it) of Medicine which we know and believe to be a mockery and a delusion, and a bane to society. It is clearly our duty to ignore the thing in the face of the public. To sit down in Professional intercourse with Homœoquacks is (as regards the public) indirectly to patronise the imposture.

The *Moniteur des Hôpitaux* has, in the eye of law, misbehaved itself towards M. Bouchut, of glottis-tubage notoriety; and in consequence its editors—head and sub—have been subjected to legal penalties. M. Bouchut only desired a proper apology; but the law did not think this enough, and therefore condemns MM. Joulin and Castelnau each to one month in prison, and a fine of 1000 francs, and orders them to insert their judgment in four papers at the discretion of M. Bouchut, and to pay all expenses.

"My warmest thanks," writes Admiral Hope in his despatch from Peiho, "are due to Staff-Surgeon Walter Dickson, Dr. John Little, of the Marine Brigade, and the Medical officers of the force generally, to whose unwearied exertions I have to attribute the present satisfactory state of our wounded; and I avail myself of this opportunity of bringing under your Lordship's special notice the very high terms in which Colonel Lemon speaks of the services of Dr. W. J. Baird, Senior Assistant-Surgeon of the Brigade."

MRS. M. A. WORLEY, late of Stony-Stratford, has left by will £1000 to University College Hospital; a similar sum to King's College; and £500 to the Free Hospital.

BRITISH LYING-IN-HOSPITAL, ENDELL-STREET, LONG ACRE.—The weekly Board of Governors have received intimation of a bequest by the late Mrs. Mary Ann Worley to the amount of £500 in favour of the above Charity.

DYSENTERY IN NORWAY.—We learn by a private letter from Norway, that in the district of Bratsberg, sixteen miles (about forty English miles) south of Christiania, an epidemic of dysentery has raged since the month of July, and up to September 12 had carried off 443 individuals out of 3017 attacked.

RELIGIOUS LUNATICS.—We learn on good authority that two females from the neighbourhood of Auchinblae, where the revival movement is being agitated, were conveyed to the Lunatic Asylum in Montrose the end of last week. Dr. Howdon is of opinion that over-religious excitement in persons predisposed to insanity is very dangerous, and that their attendance upon revival meetings is fraught with much danger to them.—*Arbroath Guide*.

DIMINUTION OF RAIN.—In the quarterly return of the Registrar-General ending with June, it is stated that "the deficiency in the fall of rain from the beginning of the year is $1\frac{1}{2}$ inch. The deficiency in the years 1854, 1855, 1856, 1857, and 1858, amounted to the average fall of one year—viz., 25 inches." In all countries traces of dried-up streams are met with; but within the historical period there are few or no examples of new rivers coming into existence. The Dnieper at Kiev is drying up. The redoubt plains of Troy can with difficulty be recognised or traced, because the rivers mentioned by Homer, whose descriptive topography is not doubted, either cannot be found or they are now such insignificant streams as to fall far below the descriptions of the poet. About the mouths of the Nile the water is becoming shallower; while there is reason to believe that the volume of its waters has been within the period of history sensibly diminished. The Baltic is decreasing. The Adriatic derives its name from a town that is now eighteen miles from the shore, and was once a flourishing seaport. North America is sensibly draining. The rivers are slowly wearing away the rock, and occupying a lower bed. America on the Pacific Ocean is notoriously rising, or the ocean which surrounds it is sinking.

OUR GREAT ONES OF THE PAST.

MEN OF THE BRITISH SCHOOL.—No. IX.

WILLIAM PULTENEY ALISON, M.D., D.C.L. OXON., F.R.S.E., ETC.

We have this week the sorrow to record the death of Dr. William Pulteney Alison, Emeritus Professor of the Practice of Physic in the University of Edinburgh. This event has removed from among us one of the most distinguished ornaments of our Profession, and one of the most excellent of men. Born of a race illustrious in Scottish literature and science, he largely added to the stock of purest family honour by his learning, his virtues, and his ever-active benevolence. Our allusions to him are for the most part based on precious recollections. When not more than thirty years of age, he delivered lectures on the Practice of Physic, in the chair of his honoured uncle, Dr. James Gregory; to which chair he was elected when that great teacher died. Pupils warmly attached to their late revered instructor, whose lessons were like those of some ancient sage, full of impressive wisdom, and not without a kind of grandeur, were relieved from any natural apprehension that after his removal the Edinburgh School of Medicine would decline, when they perceived, as they did at once, the remarkable qualifications of his comparatively youthful successor. Even then, the extent and exactness of Dr. Alison's knowledge, his calm, clear, instructive exposition of what it was most important for the student to know, and the unaffected manner in which it was conveyed, all of which must be well remembered by many living Physicians, as it is by ourselves, gave immediate assurance that the students who had repaired to Edinburgh for Medical instruction had found a great and a truthful preceptor; one, indeed, who combined a sacred love for whatever was philosophically true with the most familiar acquaintance with whatever was important in the common course, and in the highest exigencies of practice. His clinical lectures, and commentaries on cases just seen in the wards of the Hospital, were perhaps the most instructive that Medical pupils ever listened to; and the patience with which he was always ready to answer their questions, and to assist their inquiries, and the pleasure he evidently had in encouraging their desire for improvement, must be well remembered by all of them who survive. He was, in our time, one of the Physicians to the New Town Dispensary, and was ever found willing to assist the advanced students, who divided its duties among them, when they were alarmed by a difficult case; and this by night or by day, and not in his own vicinity only, but in any part of the Old Town, in the West Bow, the Grassmarket, the Canongate, and in all the intricacies of courts and wynds, and up all the painful staircases of that strange aggregation of houses and flats where poverty and sickness chiefly dwell and dwell. No devotion of time, no abnegation of self, seemed to him to be too great where the object was to relieve the sick and suffering, or to investigate the nature and causes of maladies in which art and skill had failed to prevent a fatal result. In the course of these duties, he was still ever sensible of the privations of those who were poor as well as sick; and he had, most truly, a hand "open as day to melting charity." Those who remember these chance interviews with this good Physician, also know that it is no exaggeration to say that the student always felt, that either at the bedside of the poorest patient, or in the homeward walk and talk, he derived from Dr. Alison's simplest observations some increase of knowledge, or some new matter for thought. Yet, at that time, all the more attractive enjoyments of refined life were at Dr. Alison's command. His father was the author of the celebrated "Essays on Taste," and also a most justly admired and venerated preacher; his mother was a Gregory—one of the daughters to whom Dr. John Gregory's Legacy was inscribed; he himself (Dr. John) being the amiable and accomplished Gregory whom Beattie addressed as,

"Friend, pattern, teacher, darling of mankind."

And in the highly-cultivated circle of persons often assembled in the house of the Rev. Mr. Alison, when the society of Edinburgh was especially brilliant, were to be met at that

time the then youthful Alison, the future Historian, and also the enlightened Physician whose loss we have now to deplore. From the time of which we are speaking, and when we ourselves quitted Edinburgh, Dr. Alison seems, for nearly forty studious years, to have devoted his whole mind and heart to the pursuit of truth, and to doing good,—two of the worthiest ends of human existence. His Medical writings are full of wisdom, and composed in language of singular perspicuity and elegance, every sentence bearing the stamp of profound reflection. The student of Medicine cannot read them too carefully or too often. It is difficult to conceive how, with such numerous professional occupations, public and private, as called for Dr. Alison's attention, he found it possible to take the wide and accurate survey which he did of the social relations of different classes constituting the public, and of the various sources of misery and affliction, not only in the populous city around him, but throughout Scotland, and, it may be even said, throughout the great family of man. His writings on the condition of the poor were, we believe, productive of extensive and valuable results in his own country, and their preparation must have demanded great labour and much self-sacrifice. But such was really the character of Dr. Alison, and it should never be forgotten; nor will it, we confidently trust, in an age in which, without prejudice to military merit, civil services begin to be considered legitimate objects of liberal gratitude. To acquire knowledge, and to make that knowledge useful to his fellow-creatures, was the business of his daily life. He affected no superiority; he sought no rewards; he envied no man; he was never involved in vulgar dispute or controversy; and seemed truly to seek for no personal advantage of any kind. He had received from his Maker many and great talents. His intellectual faculties and all the good affections were largely developed in his nature, and his passions had no mastery over him. None of these gifts, entrusted to him during this life's ordeal, were wasted, none neglected by him. But, in the midst of pursuits and exertions which most ennobled man's position in the creation, he was attacked by a severe, and recurrent, and incurable malady; an appreciation of which seems soon to have determined him to resign the Chair of Physic, and all its incidental advantages. Yet, so long as life remained, as soon as he rallied from each cruel accession of disorder, he ever resumed his habitual reflections and his pen; devoting, again and again, unsubdued and undiscouraged, his thoughts to whatever was good, and elevated, and enduring. Under his peculiarly distressing trials, he seems to have refrained from unavailing lamentations, and, with a great trust in God's unfailing Providence, to have made suffering no excuse for indolence, but to have worked even more seriously and strenuously, as one foreseeing that the night was coming in which, humanly speaking, he could work no more.

Many readers of this imperfect sketch of him will remember Dr. Alison as he appeared at the meeting of the British Association in Edinburgh, in July, 1858, as President; his calm, intelligent countenance; his venerable and distinguished figure; his wise and eloquent words; his unmistakeable air of sincerity and truth. We trust his address on that occasion, and his paper on the "Science of Life," then communicated, will eventually be more accessible to students in some form or other than at present. They strikingly exemplify the mental characteristics to which we have alluded. A few months afterwards he contributed to the National Association for the Promotion of Social Science a paper on the "Effect of Poverty and Privation on the Public Health;" one of the last, perhaps, of the productions of his unconquered mind in a long and manly contest with approaching infirmity. And now this great and good man has left us; but has also left us his example, worthy of all attention, but especially worthy of the attention of all engaged in

the study of Medicine. In the minds of his former pupils, and of his numerous friends, he has left an affectionate remembrance which will only cease—if then, indeed, it does cease—when they, like him, pass from this transient scene in which they still act and suffer, and have to render an account of the manner in which they also have employed or disregarded the talents accorded to them for the good of mankind. There is a kind of consolation in reflecting that the last hours of Dr. Alison's long and useful labours and life (for he had nearly attained his seventieth year) were passed in his charming retreat of Woodville, near Edinburgh, every scene of which seemed to be endeared to him, and where he had the solace of affectionate members of his family, who respected him for his high endowments, loved him for his virtues, and had cheered him in many seasons of pain. From all such trials the inextinguishable soul is now liberated and secure; perhaps, as we humbly hope, to find a still higher sphere of exertion, and still ever under the "Great Taskmaster's eye."

REVIEWS.

Notes on the Wounded from the Mutiny in India; with a Description of the Preparations of Gun-shot Injuries contained in the Museum at Fort Pitt. By GEORGE WILLIAMSON, M.D., Staff-Surgeon. Pp. 124. London: 1859.

ALL soldiers of cavalry and infantry of the line who are invalided on account of wounds, pass through the Invalid Depot at Chatham; and Dr. Williamson, who is stationed at that place, has, therefore, ample opportunities for observing the results of injuries received in battle. He has taken advantage of the recent conflicts in India to draw up a statistical account of the injuries received by our soldiers during the mutiny, together with the results of treatment. In illustration of the cases which have recently occurred, he refers to the extensive series of preparations of gun-shot injuries which are preserved in the Fort Pitt Museum; and, in order to render the cases still further instructive, he presents us with a series of well-executed engravings, representing a great variety of morbid appearances resulting from wounds received in action. The collection of cases thus recorded and illustrated affords a most valuable contribution to Military Surgery, and will be studied with advantage by the Medical officers of the Army, who may be guided in their future treatment by the lessons of experience thus offered to their notice. It would appear from the perusal of the statistics and the cases in Dr. Williamson's volume, that the appliances of modern Surgery have been adopted with great success by our Medical brethren serving in the East, and that especially by the operation of resection many limbs have been preserved, which, under the former system, would have been sacrificed. We learn also, that the success attending the Surgical operations performed during the Indian mutiny has been greater than that which followed the operations in the Crimea: 1.49 per cent. of the total wounded landed from India having recovered with good useful limbs, while only 0.34 per cent. of those landed wounded from the Crimea were equally fortunate. This result is mainly attributed by Dr. Williamson to the use of the *dooley*, a conveyance for wounded soldiers used in India, which he recommends for adoption in other wars in various parts of the globe.

The British Soldier in India. By FRED. J. MOUAT, M.D., F.R.C.S., Surgeon in H.M.'s Bengal Army. Pp. 87. London: 1859.

THIS pamphlet contains some very valuable and seasonable remarks upon the best methods of improving the condition of the British soldier in India. Dr. Mouat, in common with other Medical authorities, considers that the Indian service is, under any circumstances, highly dangerous to European constitutions; and that therefore all possible means should be adopted to lessen the evils of a tropical climate, and to render them more endurable by our fellow-countrymen. The subject is treated under the heads of the Clothing and Equipments of the European Soldier; his Arms and Accoutrements; his Barracks; the question of the possibility of Acclimatising him; his Food and Drink; his Wife and Children; his Parades and Punishments. Upon all these points much

reform is needed, and under the new aspect of military affairs in India, it will probably be accomplished, at least to a considerable extent, if the home authorities listen to the voice of reason and the counsels of experience.

It would exceed our limits to follow Dr. Mouat through the various topics discussed in his pamphlet, and we must therefore content ourselves with making a few cursory remarks upon some of its chief features. With regard to the clothing of the soldier, Dr. Mouat of course condemns the spirit of routine which orders the same clothing to be worn in the moist and variable climate of Great Britain and in the torrid plains of India; and he recommends that, both as to texture and colour, such modifications should be introduced as are suitable to the exigencies of the locality. As to the *vezata questio* of the best head-dress for the soldier, Dr. Mouat makes the novel but apparently valuable suggestion that a light helmet might be introduced, consisting of the metal aluminium, which is now produced in abundance and at a cheap rate. This metal is as light as cork, as strong and malleable as iron, receives as bright a polish as silver, and is as indestructible as platinum. Such a helmet would of course keep off the rays of the sun, while its lightness would obviate any inconvenience to the soldier's head. On the question of the possibility of acclimatising the European soldier, Dr. Mouat concludes that nature has placed invincible obstacles against the assimilation of the European with the native of the tropics, and that, under any circumstances, a great proportion of our army in India must consist of native forces; but that much may be accomplished towards the comfort of the British soldier in India by judicious management as to clothing, feeding, occupations, and other matters, which at present are regulated upon unsound principles. There are many other points discussed with great force and ability in Dr. Mouat's pamphlet, which we recommend to the notice of all interested in the condition of the army in India.

Sketch of the Medical Topography, or Climate and Soils of Bengal and the North-West Provinces. By JOHN MCCLELLAND, F.L.S., F.G.S., Surgeon in the Bengal Service. Pp. 148. London: 1859.

Dr. McClelland examined last year the circumstances connected with the prevalence of cretinism in the plains of Bengal. The inquiry led him to examine particularly the climate and soils of that part of India, and of the North-West Provinces generally. The result of his investigations is briefly summed up in the volume before us, which presents a very able history of the geological structure, botanical peculiarities, and meteorology of the district in question. On the subject of cretinism and goitre, the statistics of Dr. McClelland clearly prove that the occurrence of these affections is closely connected with the nature of the soil,—the calcareous rocks presenting a great preponderance in this respect over the other geological formations. This connexion between calcareous soil and goitre has been distinctly traced in Switzerland. Dr. McClelland offers the hypothesis that the effect may partly be due to the disengagement of carbonic acid gas from the limestone, and the consequent impurity of the air; and also to the great quantity of the same gas contained in the drinking-water. In a chapter on the Influence of Soils, Dr. McClelland points out the relation existing between the soil on the one hand, and the occurrence, in Bengal, of goitre and cretinism, remittent fever, and dracunculosis. In his concluding chapter he offers some general remarks upon the best methods of improving the sanitary condition of the residents in India. In common with all the best writers on Indian Hygiene, Dr. McClelland recommends that stations upon the hills should be selected for the purposes of European colonisation, and the location of European troops. He thinks that any elevation on a light rocky soil above a thousand feet would be preferable to the plains.

Celestial Objects for Common Telescopes. By the Rev. T. W. WEBB, F.R.A.S. London: 1859. 8vo. Pp. 246.

THE author does not intend by the term "common telescopes," such an instrument as most people possess, costing from two to five pounds, but "achromatics of various lengths up to five or five and a half feet, with apertures up to three and three-quarter inches, or reflectors of somewhat larger

diameter." Those who can afford such an instrument will find in Mr. Webb's book plain directions for its use, and a list of objects showing the wonder and glory of the heavens to the observer. They will find more than this: they will find directions what to look for, and how to look for it; how to gain real instruction from the use of the telescope, and how to use it in a systematic, improving manner. Many of our readers may learn from this book how to make a leisure evening hour delightfully interesting.

Peaks, Passes, and Glaciers. A Series of Excursions by Members of the Alpine Club. Second Edition. Edited by JOHN BALL, M.R.I.A. President of the Club. London: 1859. 8vo. Pp. 520.

SEPTEMBER is *par excellence* the holiday of the London Doctor. The men who work hard from October to August in lecture and dissecting-room, in ward and theatre, in home consulting-room, or in the sick-chamber; rush off in September to loch and moor, to some seaside or sylvan retreat, or to the Continent, seeking for health and enjoyment far away from metropolitan turmoil. The peaks, passes, and glaciers, the lakes and valleys of the Alps, will always have a most powerful attraction to those who blend scientific pursuit with love of mountain scenery. To such men the book before us will be especially acceptable. It contains accounts of comparatively unknown and little-frequented Alpine districts, out of the beaten tracks of ordinary tourists, illustrated by excellent plates and maps, and enriched by a chapter of useful suggestions for Alpine travellers. We need not say more of this book than to recommend it heartily to those of our readers who intend to make holiday among the mountains, or to those who only wish to pass a pleasant and instructive hour or two in following the excursions of the Alpine Club.

The Roman or Turkish Bath: its Hygienic and Curative Properties. By WILLIAM POTTER.

In this pamphlet Mr. Potter offers some remarks upon the beneficial effects of bathing in general, and of the peculiar efficacy of the Turkish Bath, an imitation of which he has introduced to the British public at Manchester. It appears to be analogous to the bath described by Celsus, consisting of a suite of rooms, called respectively the frigidarium, the tepidarium, the sudatorium, and the lavatorium; and shampooing constitutes an important part in the ceremony of bathing.

The Annual Report of the Grant Medical College, Bombay. Thirteenth year. Session 1858-59. Bombay: 1859.

WE are informed by this Report that the Grant Medical College continues in a prosperous state, and that although the number of students is not great, yet that their attainments in the Profession do credit to themselves and their instructors. The usual statistical tables are appended, showing the number and nature of the cases treated in the Hospital, and the examination papers are also printed; the latter forming a fair means of judging of the standard of excellence attained by the students.

Remarks on the Anatomical Relations between the Mother and Fœtus. By HENRY MADGE, M.D. Pp. 49. London: 1859.

IN consequence of some experimental investigations made by Dr. Madge, in a case where the fœtus was removed soon after the death of the mother, he was induced to doubt the commonly-received opinion that there is a true vascular connexion between the mother and the fœtus. His view is that although arteries and veins exist both in the placenta and the uterus, yet that these vessels are only nutritious, and that the chief reservoirs of blood are large sinuses on the placental surface of the uterus, and large cells on the uterine surface of the placenta. These cells and sinuses are separated, according to Dr. Madge, by the two layers of the decidua during foetal life, but they communicate with each other through that membrane by endosmosis. The hæmorrhage which occurs during and after labour, is therefore neither arterial nor venous, but consists of a gushing of blood from the uterine sinuses, which in ordinary cases are soon afterwards emptied by the contractions of the uterus.

PROGRESS OF MEDICAL SCIENCE.

Selections from Foreign Journals.

ON HYPERTROPHIC ELONGATION OF THE CERVIX UTERI, MISTAKEN FOR PROLAPSUS UTERI.

By M. HUGUIER.

M. HUGUIER thus concludes a long memoir upon this subject with the following propositions:—1. Prolapsus of the uterus, whether complete or incomplete, is not one single disease, but various affections designated by one name. 2. When the uterus projects externally, and when even the vagina is completely inverted, and the uterus from the size of the tumour, in the centre of which it is placed, seems to have entirely descended between the thighs, in the very great majority of cases, it is not the entire uterus which has thus descended and left the pelvis, but there is only a partial or general hypertrophic elongation. 3. In the affection known as prolapsus, hypertrophic elongation is no exception, but a very general rule. 4. Two principal varieties of longitudinal hypertrophy, the sub-vaginal and supra-vaginal, constituting to some extent two different diseases, may simulate prolapse. 5. In the *sub-vaginal* variety of elongation, the cervix forms within the cavity of the vagina a cylindroid, or more or less elongated conoid projection, the free end of which approaches the vulvar opening, or becomes engaged between its lips, without the vulvo-uterine canal becoming shortened, invaginated or inverted upon itself. 6. This has been confounded with partial descent of the uterus, when it has not been taken and treated for a polypus, a chronic inversion, a follicular cyst or a dropsical condition of the cervix. 7. No exact description has been given of it, although its characters are very decided, with regard to its development, its symptoms, and its treatment. 8. Internal treatment and the various forms of cauterisation are only applicable to very slight hypertrophies and to those which are complicated with inflammation and engagement. 9. Pessaries are generally useless or dangerous. 10. When the elongation reaches from five to seven centimetres and gives rise to serious accidents, excision of the cervix at half a centimetre below the insertion of the vagina should be executed. 11. The disease which has hitherto been termed complete prolapsus, or descent of the uterus, is very generally only a longitudinal hypertrophy of the *supra-vaginal* portion of the organ, the body and the fundus remaining within the cavity of the pelvis, although the vagina may be entirely inverted, and the tumour, as long or longer than the uterus in its normal condition, may hang pendant between the thighs. 12. The instances of hypertrophic elongation of the cervix, which have been now and then related by the authors of the last and present century, have led to no practical conclusion, the affection having been always confounded with true prolapsus. 13. The specimens collected by the author and since by others, and demonstrated before the Surgical Society, and those contained in the Dupuytren Museum, prove the frequency of the affection. 14. In the treatment of this affection, we should not resort to a surgical operation until serious symptoms arise and medicinal and prothetic means have proved insufficient. 15. The various operations which have been hitherto devised are of no use in this case, although they may prove useful in simple prolapse without hypertrophic elongation. 16. Amputation of the cervix above the vaginal insertion, more or less near the body of the organ, according to the degree of elongation, is the only means of effectual treatment. 17. The arteries of the uterine tissue are tied with difficulty, and they should be seized by means of a kind of tenaculum, which is left attached until it spontaneously falls. 18. The *écraseur* is useful in terminating the section of the cervix, especially when the part is very vascular. 19. The operation is contra-indicated when there is a large pelvis as well as a large vulvar aperture, when there is laceration of the perineum, or when the soft parts constituting the floor of the pelvis are in a very relaxed condition. 20. When the operation is performed under proper conditions, no relapse takes place, and the health becomes quite restored.

M. Depaul concludes a long criticism of M. Huguier's view,

with the following propositions:—1. That hypertrophic elongation of the *intra-vaginal* portion of the cervix has been long known and described. 2. It cannot be confounded with slight descent of the uterus, and still less with that amount of descent in which a more or less considerable portion of the organ has passed the vulva. 3. Palpation of the abdomen, the introduction of the finger into the vagina and rectum, and direct inspection suffice in all cases to establish a certain diagnosis, without there being any necessity of resorting to uterine catheterism—a means which may be most mischievous in its operation, and which should be reserved for certain exceptional cases of uterine disease. 4. Medicinal agents properly adapted, and especially cauterisations, suffice in nearly every case. 5. The proposition of amputating the cervix should not therefore be generalised, even under the circumstances stated by M. Huguier, this being in fact one of the most serious operations, which has already cost many lives. 7. Hypertrophic elongation limited to the *supra-vaginal* portion is not met with—the condition described by M. Huguier as such being really hypertrophy of the entire uterus, or elongation of the organ without hypertrophy, and sometimes even accompanied by atrophy. 8. Elongation of the uterus, with or without hypertrophy, has been long known, and is described by Cloquet, Dugès and Boivin, and Creveilhier. 9. Since uterine affections have been more carefully studied, this anatomical disposition has not been confounded with complete prolapsus of the uterus. 10. Partial or general hypertrophy of the uterus has been considered as a cause or a consequence of the prolapse. 11. Prolapsus of the uterus in which a portion of the organ has passed the vulva is a rare affection, and the complete descent is even much more rare. 12. When prolapsus in any of its degrees does occur, its diagnosis may be made with sufficient precision by the usual means of exploration. 13. The uterine sound, besides that it is a dangerous instrument, does not enable us to appreciate the thickness of the walls of the uterus, or to accurately ascertain the dimensions of its diameters. 14. The operation proposed in the author's so-called *supra-vaginal* variety is still more dangerous than the simple amputation of the cervix, in consequence of the greater extent of the uterine wound and the vicinity of the peritoneum.—*Bulletin de l'Académie*, Tome xxiv., pp. 592 and 721.

EXCERPTA MINORA.

Dislocation of the Ulna upon the Humerus without Injury to the Radius.—Dr. Isaacs reported to the King's County Medical Society the case of a boy, 13 years of age. The coronoid process was thrown backward into the posterior sigmoid fossa of the humerus, while the olecranon projected backwards and upwards. The forearm and hand were twisted inwards. On the posterior and lower part of the arm was a deep depression into which the hand could be sunk. Chloroform was administered, and, after Liston and Cooper's plans of reduction had been tried in vain, the arm was firmly fixed by an assistant, while the left hand of the Surgeon was strongly applied against the forearm at the elbow, pressing the coronoid process backward and outward. The forearm being now suddenly flexed, the dislocation was instantly reduced.—*New York Journal*, July, p. 38.

Dr. Warren's Styptic in Internal Hæmorrhages.—Dr. Cook reported that he had used the styptic recommended by Dr. Warren, of New York, in almost every variety of hæmorrhage, and has hardly known it fail in hæmoptysis or uterine hæmorrhage. It consists of sulphuric acid, 3v.; spt. turpentine, alcohol, aa ʒij. The turpentine is slowly mixed with the acid, and, the alcohol having then been added, the mixture is put into a stoppered phial. The dose is 40 drops rubbed up with sugar, and given in a teacupful of water, a second dose being given one hour after the first, and a third two hours after the second.—*New York Journal*, July, p. 41.

Pruritus Vagine.—At a discussion upon this subject at the King's County Medical Society, the local applications named as of most benefit, especially in cases of pregnancy, when constitutional treatment is restricted, were glycerine, solutions of tannin (ʒij. ad ʒj.), of cyanuret of potassium (3ʒ ad lb. ʒ), or of prussic acid. An obstinate case was relieved by tris-nitrate of bismuth mixed with elder ointment. Ice-cold water is a common and often an effectual means of alleviation. Solutions of nitrate of silver (sometimes even 40 grs. ad ʒj.) have been applied with decided effect. When dependent upon ascarides, an enema of equal parts of quassia and wormwood

has been found effectual; and in one obstinate case, when the simple infusion failed, the addition of common salt and tincture of camphor rendered it quite effectual.—*New York Journal*, July, p. 43.

Collodion in Puerperal Peritonitis.—M. Latour relates a case in which an alarming condition of puerperal peritonitis was speedily cured by spreading a layer of collodion over the surface of the abdomen. This practice he adopted in consequence of his theory that inflammation is but a local exaggeration of animal heat, and that the immediate action of the air on the skin is one of the indispensable conditions of the production of this heat.—*Union Médicale*, No. 3.

Camphor as an Ectrotic in Variola.—Chance first taught Dr. Neubold a fact which he has since repeatedly verified,—that if the pustules of small-pox are from the beginning covered with linen upon which camphor has been rubbed, they will dry away without passing through their various stages. He finds also that the administration at an early period of a demulcent drink containing a little camphor expedites the progress of the febrile stage.—*L'Union Méd.*, No. 94.

FOREIGN CORRESPONDENCE.

FRANCE.

PARIS, SEPTEMBER 12, 1859.

At the present moment the Hospitals of Paris are deprived of much of the interest which usually attaches to them, in consequence of the absence of many of their Physicians and Surgeons, several of whom, as is their wont at this season of the year, having gone, as the French say, "*Aux Eaux*," to recruit the energies of mind and body which their arduous duties during the past year are presumed to have lowered or diminished. Velpeau, the star of attraction to the students at "*La Charité*," disappeared about a fortnight ago, and his place is at this moment supplied by his colleague and friend, M. Manec. Robert and others of note and celebrity at the Hôtel-Dieu are also enjoying their autumnal holidays, while their wards are superintended by young men furnished by the Bureau Centrale, some of whom, by the intelligence they display, are evidently destined, in their turn, to follow in the footsteps of their more experienced masters. No class of men we know stand more in need of a temporary relaxation than do the Medical attendants on Hospitals of a large city; and while we sincerely hope they may enjoy their autumnal rambles, we shall rejoice to see them return endowed with fresh vigour for the work of the coming session. Although between the absence of Medical celebrities from the capital and increase of disease, there can be traced no rational connection, it is nevertheless worthy of remark, as a coincidence, that during the last fortnight, certain maladies have become unusually prevalent. Typhoid fever, for example, has increased considerably; while dysentery and choleraic diarrhœa have been prevailing to an alarming extent, not only in the Hospitals generally, but also among the more respectable classes of the community at large. The typhoid fever is of a mild type. I have observed sundry deaths from dysentery, but these have happened to individuals much debilitated by previous disease. It is reported that cases of genuine Asiatic cholera have also been met with, but I have not had an opportunity of substantiating the correctness of this statement. I have certainly observed one or two cases in "*La Charité*," and elsewhere, accompanied with cramps, cold extremities, and other alarming symptoms, but in which the real pathognomonic features of the Asiatic form of cholera were wanting; and it is just possible that the occurrence of some such cases may have given rise to the report. These affections of the bowels may, I believe, be traced to atmospheric changes, taken in connection with the indiscriminate and immoderate use of unwholesome and unripe fruits, which the lower orders indulge in to a great extent at this season of the year. Although the weather is remarkably dry and bracing, still the change from heat to comparative cold, especially in the evenings, has been very sudden, and this circumstance alone is sufficient to give rise to gastric and enteric affections. Add to this, that the public mind is at present kept in a state of comparative alarm at the accounts in circulation of the dreadful ravages of cholera in certain parts of Germany, and you

have a *morale* favourable to the production, if not of cholera, at least of diseases of a similar though milder type.

In the department of Surgery, the principal occurrence of interest which I have to chronicle is the ligature of the common carotid, which was practised some three weeks ago by M. Chassaignac, at the Hôpital Laribosière, and under circumstances demanding not only great presence of mind, but all the higher qualities which go to constitute a skilful and successful Surgeon. In the case in question, M. Chassaignac gave ample proof of the justness of his claims to be regarded as one of the leading operating Surgeons of the French capital. The patient on whom the operation was performed was the subject of a tumour which appeared externally in the space between the mastoid portion of the temporal bone, and the inferior maxillary; and internally, formed a projecting mass in the back part of the pharynx. This tumour, which the patient had remarked only fifteen days before his entry into the Hospital, was fluctuating; and, on minute examination, nothing resembling pulsation could be detected. Several ganglia in the sub-maxillary region were also swelled and hard. Under the impression that it was an idiopathic abscess, M. Chassaignac believed that the best course he had to follow was to make an opening for the evacuation of its contents. With a view to this, he carried a bistoury down to the bottom of the pharynx, and made a small puncture towards the outer edge of the tumour, but neither matter nor fluid of any kind followed. He then made a second puncture towards the inner edge of the tumour, and at a point corresponding with the median line of the pharynx. No sooner was the second puncture effected than forth came a jet of arterial blood, which but too plainly showed that a serious error had been committed. M. Chassaignac, without a moment's delay, endeavoured to arrest the hæmorrhage by thrusting his finger into the patient's throat, and exercising direct pressure over the wound. This proved, as might readily be imagined, of little avail. The blood continued to find its way past the sides of his finger into the mouth and throat of the patient and produced temporary suffocation. Seeing that compression was useless, as exercised in this way, and the speedy and inevitable death of his patient staring him in the face, he, with an admirable *sans froid*, and great presence of mind, seized the carotid, together with the skin and intervening tissues, between his fingers and thumb, placed the man in a convenient position, and then and there proceeded to the ligature of the vessel *secundum artem*. The moment the artery was seized, the bleeding stopped, and it has not returned since the ligature was accomplished. A circumstance worthy of note connected with the case was the occurrence of complete aphonia almost simultaneous with the tying of the vessel, while distressing headache tormented the patient for several days. The loss of voice, a phenomenon by no means uncommon as a consequence of this operation (especially when, by accident, any of the filaments of the pneumogastric nerve happen to be injured or embraced in the ligature, it is sometimes permanent), continued in the present case only some forty hours; thus proving that notwithstanding the urgency of the case and the consequent absence of the usual preparations which such a delicate and dangerous operation demand, it had been ably and carefully performed. The patient's recovery from the effects of the operation is now nearly complete, and his health almost as good as ever. The original tumour remains almost in the same state as before, with this exception, that its upper surface has become firmer and harder, while its interior portion has become softer. The enlargement of the submaxillary ganglia which accompanied the tumour, has also disappeared. I am disposed to think (although M. Chassaignac does not admit it) that he is conscious of having erred in his diagnosis, and that, notwithstanding the absence of anything like pulsation in the tumour, he now believes it possible that he *must* have had to do with a case of aneurism. Such a mistake might happen to any Surgeon, however great his experience; and if M. Chassaignac thinks he has had cause, in the first instance, for self-reproach as regards his diagnosis, he has the satisfaction now of having, by his skill and dexterity as an operator, fully repaired by his hands the blunder which his head committed. Supposing the tumour to be of an aneurismal character (which I think there is reason to believe it was), the probability is that the same surgical means thus employed *à l'improviste* would have,

in the end, and after full deliberation, been had recourse to for its cure.

At the meeting of the Académie des Sciences, on August 29, a most interesting paper, on the Use of Woorara as a Remedy in Traumatic Tetanus, was read by M. Cl. Bernard, on the part of M. Vella, a distinguished physiologist of Turin. I may mention, before giving an abstract of this paper, that as far back as 1850 M. Bernard showed that Woorara, while it destroys the peculiar properties of the motor nerves, exercises but little influence on the nerves of sensation, and that it so acts on the motor nerves as to cause paralysis of them, beginning at the periphery of the nerve and proceeding gradually to its centre; this being an action the reverse of that observed in the ordinary paralysis of these nerves. Muscular contractility is, according to the same physiologist, quite distinct from, and independent of, the nervous influence which calls it into action, for he has proved that after the Woorara poison has completely destroyed the conducting power of the motor nerves, the muscular tissue continues to contract when it is directly irritated by electricity or other stimulants. Proceeding on the accuracy of these views, M. Vella instituted a lengthened series of experiments in 1856, which led him to conclude that there is a direct antagonistic action as regards their effects on the nervous system, between strychnine and Woorara; in other words, that the effects produced on animals by one of these poisons, can be neutralised by the other. M. Vella, who during the late war was attached to the French Military Hospital at Turin, having observed several cases of tetanus among the wounded, in which the use of opium, ether, and the usual remedies had failed, deemed it a fitting opportunity for the application to the human subject of the experience he had derived from his observations on animals. His first experiments were made on two soldiers, both suffering from tetanus; in the one the affection was of four, and in the other of five days' standing. Both were in a state of demi-asphyxia, and their recovery altogether hopeless; notwithstanding this, however, the application of Woorara was followed by a certain amount of muscular relaxation, and of general relief to the patients, although both, in the end, terminated fatally. In a third case, the experiments were more successful, and the patient was discharged from the Hospital perfectly cured. The subject was a French Serjeant who had been wounded on June 4, at the battle of Magenta, by a ball which had caused an incomplete fracture of the first metatarsal bone of the right foot, with laceration of the tendons and soft parts. He entered the Hospital on June 10 under the most favourable circumstances. Three days afterwards the ball was extracted, and the operation relieved him of much of the pain which the presence of the foreign body had caused him. On the third day after the extraction of the ball, stiffness of the neck made its appearance, attended with difficulty of moving the jaw and the head. There were also slight convulsions, but these were of short duration. The day following the jaws became firmly locked, rendering it at times impossible for him to open the mouth. On the 18th the occurrence of trismus, opisthotonos, and other characteristic symptoms, left no doubt as to the serious character of the disease, and it was declared by all the Surgeons attached to the Hospital to be general tetanus. The condition of the man was so serious and alarming that M. Vella deemed it necessary to bleed him from the arm for the purpose of relieving the asphyxia with which he was threatened. He then, after having freely incised the wound, administered a powerful dose of opium, but these measures produced no good result. On the afternoon of the same day he decided on the application of Woorara to the wounded foot; the dose being in the proportion of two grains of Woorara to an ounce and a third of water, applied in the form of compress; the strength of the solution was gradually increased until it reached the proportion of twenty grains of the Woorara to nearly three ounces of water. Three-quarters-of-an-hour after the application of the weaker solution, and half-an-hour after the more powerful was employed, a visible diminution of the tetanic rigidity was the result, followed by such complete muscular relaxation, that the patient was almost immediately able to drink, to take soup, to urinate, and to sit up in bed. At the commencement of the treatment it was remarked that as soon as the peculiar physiological effects of the Woorara began to pass off the tetanic spasms reappeared with as

much violence as ever, and that the wounded leg was always the first part of the body affected by them. After three days of this treatment a large blister was applied to the thigh, in order to secure a more extensive absorbent surface, and the solution was applied to it as well as to the wound of the foot. For four days the dressings of the entire absorbing surface were renewed every three hours, then every five hours up to the twelfth day, when they were reduced to twice in the twenty-four hours. It was remarked by M. Vella that the wound of the foot and the raw surface produced by the blister were not irritated by the application of the Woorara, as they healed very rapidly. M. Vella resumes his case in the following language:—"The Woorara, which for the first eight days succeeded in rendering greater the interval between the paroxysms, and in diminishing their intensity, ended by making them disappear entirely; and on the 10th of July the patient was able to leave his bed for the first time without experiencing any convulsive shock." On the 15th he went out for an hour, and on the 25th of the same month he left the Hospital perfectly cured. M. Vella terminated his remarks by expressing a wish that this novel treatment should be repeated by other Practitioners in cases of a like nature; he, however, adds, that the tetanus should be attacked as near its *début* as possible, and before it has too seriously implicated the vital organs, especially the lungs. M. Vella also proposes the same treatment for hydrophobia; the want of opportunity only has prevented him, long ere now, from employing it in that formidable disease.

The reading of this highly interesting paper was followed by a quiet and dignified discussion, in which MM. Velpeau, Serres, Cl. Bernard, Cloquet, Jobert de Lamballe, etc., took part. With the exception of M. Velpeau all these gentlemen were disposed to regard the happy termination of the case recorded as being due to the curative influence of the Woorara, inasmuch as the effects produced by this agent are physiologically opposed in their character to those engendered by the disease it was employed to combat. Velpeau, who maintains that this may have been an exceptional case and a spontaneous cure, would like, no doubt, to subject M. Vella to the same ordeal at La Charité, by which he strangled his friend, the famous "Docteur Noir."

GENERAL CORRESPONDENCE.

MR. PYE H. CHAVASSE AND DR. BARKER.

LETTER FROM MR. PYE H. CHAVASSE.

[To the Editor of the Medical Times and Gazette.]

SIR,—I have seen Dr. Herbert Barker's letter in your *Gazette* of to-day, and as I wish to "set myself right with the Profession and the public," it will be necessary for me to enter rather more into detail than I did in my former letter to you, more especially as Dr. Barker makes very light of his conduct towards me.

Before proceeding further, I will give you additional parallel passages from the two works:—

DR. HERBERT BARKER.

"That the pupils have a supply of as much plain wholesome food . . . as they can eat; that the school is situated in a healthy locality; . . . that at least one-third of the day be devoted to recreations, such as walking, running, skipping, gardening, etc.; that the pupils retire regularly to rest at an early hour, and rise early; . . . that each pupil has a separate bed, that the bedrooms are well ventilated, and that too many are not allowed to sleep in one chamber; . . . in short, every care must be taken that moral and physical health be

MR. PYE H. CHAVASSE.

"That the pupils have as much plain wholesome food as they can eat; that the school be situated in a healthy spot; that there is a good playground attached to it; that the pupils are allowed plenty of exercise in the open air; indeed, that at least one-third of the day is spent there in skipping, gardening, walking, running, etc.; that they are compelled to rise early in the morning, and that they retire to rest early; that each pupil has a separate bed; and that many are not allowed to sleep in the same room, and that the apartments are well venti-

not sacrificed to mere accomplishments."—*The Hygienic Management of Infants and Children*, 1859, p. 111.

lated. In fine, their health and their morals should be preferred far before their accomplishments."—*Advice to a Mother*. Fourth Edition, 1852, pp. 263, 264.

Let any impartial reader compare the two books, and I think that he will come to the conclusion that Dr. Barker has copied my ideas and thoughts, clothed, it may be (but not always, as the parallel passages in to-day's and last week's *Medical Times and Gazette* will show), in language of his own.

Twenty years ago there was scarcely a work written on the maternal management of infants and children,—hence I was mainly thrown upon my own resources; and with regard to the formulæ of infants' diet, or "pap formulæ," as Dr. Barker elegantly expresses it, the recipes were my own, having the benefit for several years, before my work was written, of an extensive practice among children.

Dr. Barker asserts, in one of his letters to me: "I find the pap formulæ which I have given, in twenty-eight works, and in five of them in very nearly the same phraseology. I have never deemed it necessary to refer to yourself any more than to twenty-seven (?) other authors, nor have I wished to 'palm off' anything as old as Eve herself as my own. . . . I may mention that the very same pap formulæ appeared in a little work of mine on the 'Diet of Infancy and Childhood,' ten years ago; and in a chapter on the same subject in Richardson's *Sanitary Review*, three years ago in January next." If twenty-seven or twenty-eight books, according to Dr. Barker's statement (for he uses both numbers), have been published on the management of infants and children, he being (as he declares in a letter to me) actually in possession of them, in his own library, at the present time,—if such a number be really in existence,—I shall feel grateful to Dr. Barker, if he will give the titles of the same, of those especially published twenty years ago, indicating the titles of the books where I can find the pap formulæ, as Dr. Barker declares, "in very nearly the same phraseology as my own." Although, since writing my own work, I have read a great deal on and about children (as it is my favourite study) I have never been able to read such formulæ in any book but my own, save and except in Dr. Barker's, "On the Hygienic Management of Infants and Children." I beg Dr. Barker's pardon. Dr. Barker has written a great deal on the "Diet of Infancy and Children," and in the *Journal of Public Health and Sanitary Review*, on the management of children. In all of which works he has had the good taste to make use of my book. He has given the readers of the above publications the benefit of my pap formulæ in full. Moreover, he has inserted the following passages, and palmed them off as his own:—

DR. HERBERT BARKER.

"When a youth is delicate, double soles, with a layer of cork or bladder between them, is advisable."—*Sanitary Review*, July, 1857, page 169.

"Wet feet are a most frequent source of cold."—*Ib.*, page 169.

"The windows of a nursery should be thrown open when the children are not there. and, in fine weather, should be frequently partially opened when the children are there. A change of room is very desirable, when children are long confined to the house from inclemency of weather. In short, let it be understood well, that a supply of pure air is as much needed by the lungs of the child, as the supply of wholesome food is required by the stomach."—*Ib.*, page 173.

"A good thermometer . . . should be considered an indispensable appendage to a nursery."—*Ib.*, page 171.

MR. PYE H. CHAVASSE.

"If boys or girls be delicate, they should have double soles to their shoes, with a piece of bladder between each sole, or the inner sole may be made of cork."—Page 226.

"Wet feet are one of the most frequent causes of bronchitis."—Page 226.

"The windows should be thrown open whenever the child is out of the nursery; indeed, when he is in, if the weather be fine, the upper sash may be lowered a little. A child should be encouraged to change the room frequently, in order that it may be freely ventilated; for good air is as necessary to a child's health as wholesome food, and air cannot be good if it be not frequently changed."—Page 146.

"A good thermometer should be considered an indispensable requisite to a nursery."—Page 146.

"The head should be kept cool."—*Ib.*, July, 1858, page 168.

"The chest and the abdomen should be kept warm."—*Ib.*, July, 1857, page 168.

"Respecting night-dresses, we may observe, that, in the winter, if the children have the habit of throwing the bed-clothes from them, a flannel nightgown may be used."—*Ib.*, page 168.

"The free use of sugar is not to be recommended: it tends to cloy the stomach and weaken the digestion, thus producing acidity, sour eructations, and flatulence."—*Journal of Public Health*, July, 1856, page 149.

"The milk, however, should not be warmed over a fire . . . but only by the admixture of the proper quantity of water, previously heated, so as to raise it to the temperature of milk from the breast, namely, from ninety to ninety-five degrees Fahrenheit."—*Ib.*, July, 1856, page 151.

My work was first published twenty years ago; Dr. Barker's on "The Diet of Infancy and Childhood," ten years ago. The *Journal of Public Health* and *Sanitary Review*, containing Dr. Barker's literary piracies, about three years ago.

Of course, these works that Dr. Barker declares he has in his possession, have been before the public seventeen or twenty years, as those are the dates of my first and second editions, and from which Dr. Barker has principally and so freely copied the passages in question; otherwise, authors not over scrupulous may do what Dr. Barker has done, and copy passages, and long ones, too, (as your *Journal* of last week and to-day can testify,) from my book, and palm them off as their own, although they may be only "pap formulæ," which, according to Dr. Barker (in his letter to me and his letter to you of to-day) is quite of minor, but which, in my humble opinion, is of vital importance to the infant population. The editor of the *Dublin Quarterly* (no mean authority) thought so, having copied the "pap formulæ" *in extenso*, and giving it, as he thought, "in Dr. Barker's own words," and appending commendations thereto. In justice to Dr. Barker, I should state that he formerly thought most highly of infant dietary (having copied my dietary three separate times). It is only during the last month or two that he has altered his opinion.

I call upon Dr. Herbert Barker to furnish without loss of time the dates and parallel passages of my work and the twenty-seven or twenty-eight works he declares he now has in his library, and of the five works especially in which the formulæ for infants' food are similar to my own, and "in almost the same phraseology." Less than this will not satisfy me nor the Profession. If he does not do so, the only inference that can be drawn is, that he has asserted that which he cannot prove.

"The head should be kept cool."—Page 34.

"The chest, the bowels, and the feet should be kept comfortably warm."—Page 131.

"Flannel night-gowns.—Children frequently throw the clothes off them . . . on which account I recommend them to be worn."—Page 132.

"Much sugar cloyes the stomach, weakens the digestion, produces acidity, sour belchings, and wind."—Page 67.

"The milk itself should not be heated over the fire, but should be warmed by the water. . . . The milk-and-water should be of the same temperature as the mother's milk, that is to say, about ninety to ninety-five degrees Fahrenheit."—*Advice to a Mother*, Fourth Edition, 1852, page 57.

I am, &c.

Birmingham, September 17, 1859. PYE H. CHAVASSE.

NEW LICENTIATES OF THE EDINBURGH COLLEGE OF PHYSICIANS.

[To the Editor of the Medical Times and Gazette.]

SIR,—Among your very numerous correspondents on the subject of the licence of the Edinburgh College of Physicians, I think none of them have drawn attention to the fact that the gentlemen who have obtained the licence have not given up the practice of Pharmacy. Such, I assure you, is the case in the North of England, where the majority of the new licentiates are country Surgeons, and it is impossible that they can do otherwise than dispense their own medicines. There

can be only two conclusions arrived at, either that the College gives its licence very indiscriminately, without requiring from the candidates any promise not to practise Pharmacy, or else knowingly grants it to gentlemen known from their position as simple village Practitioners, to dispense for themselves. In fact, there is one instance I know of, where a Member of the College of Surgeons keeps an open shop in a very large town in the North of England, who lately bought the licence of the Edinburgh College of Physicians, and who has "Dr." on the shop door, and continues to sell over the counter. Surely, while such a state of things lasts, no one can consider it in the light of a higher professional grade to be a Licentiate of the Edinburgh College, nor are the Council carrying out what they wished it to be understood was the intention of the College—to separate the practice of Pharmacy from the Profession of Medicine. I am, &c.

Durham, Sept. 1859.

Iatrops.

THE SMETHURST CASE.

LETTER FROM MR. RHODES.

[To the Editor of the Medical Times and Gazette.]

SIR,—The recent trial of Dr. Smethurst having directed the attention of the Medical Profession to a certain class of symptoms which may show themselves in the early period of pregnancy; a brief outline of the following case may not be uninteresting to your readers. It was evidently in some respects a similar case to the one related by Dr. Quain, published in the *Medical Times and Gazette* on September 10th; but fortunately did not terminate fatally.

April 6th, 1859.—I was called to see Mrs. B— aged 42 years. She had been ailing a few days, with symptoms of dyspepsia and disordered bowels accompanied by vomiting. On the seventh and eighth she appeared considerably relieved, but on the ninth was attacked early in the day with violent vomiting attended by pain at the stomach, which symptoms continued, with slight intermissions, until the following day, and produced such extreme exhaustion that her life was despaired of. Sinapisms were applied to the epigastrium, followed by a blister, and calomel and opium administered in the form of small pills every two or three hours, till the violence of the symptoms abated. Occasional vomiting, etc., continued daily about ten days longer, and the patient, suffering from great debility, remained under treatment to May 4th.

The patient at the commencement of the attack was a healthy robust woman, accustomed to considerable exertion; had she been otherwise I am quite certain her case would have been a fatal one. The symptoms at the time could only be accounted for on the supposition that the case was one of acute gastritis. About the beginning of July last I saw Mrs. B—, and she informed me she had discovered to her great astonishment that she was pregnant, and expects being confined in the latter part of December next. She had her last child ten years ago.

Perhaps, Sir, you will excuse me mentioning another case which occurred in my practice a short time ago. Although not bearing upon the point in question, it being connected with the end instead of the beginning of pregnancy; yet I think it illustrates the great amount of dangerous gastric disturbance which may be produced by certain conditions of the uterus associated with pregnancy.

July 30th, 1859.—I was summoned to attend M— N—, a young unmarried woman, in her confinement. I found her in the first stage of labour, the os uteri slightly dilated, rather rigid, every pain accompanied by severe vomiting. She was delivered in the afternoon of the following day of a dead child. The vomiting had been incessant during the whole time of the labour, and still continued with increased violence, accompanied by great thirst and a burning sensation in the throat. In spite of all the usual remedies, the application of counter-irritation to the epigastrium, etc., the symptoms continued severe until August 3rd, when they subsided, and the patient, a strong and otherwise healthy girl, rapidly recovered. The secretion of milk took place (accompanied by the lochia) in the usual manner.

In this case strong suspicions of something injurious being administered, began to occupy my mind, and I had determined

on the third day to adopt measures accordingly, had not the symptoms on my next visit been considerably improved.

I am, &c. JAMES RHODES, M.R.C.S., &c.
Pontefract, September 16, 1859.

ON THE MORBIFIC INFLUENCE OF "BIG BEN."

[To the Editor of the Medical Times and Gazette.]

SIR,—I am induced to inquire of your readers resident in London whether they have experienced, as I have done, the very depressing effects produced on their nervous patients by the sepulchral note of "Big Ben?" I have now witnessed this in three several instances.

A young man, resident about two miles from Westminster, and who some time ago received a severe shock to his nervous system by a railway accident, was slowly convalescing, when a few weeks since a relapse occurred. This, with great reluctance he informed me, was owing to "Big Ben;" that every night since the clock had began its work, being troubled with sleeplessness, he had lain awake in the state of the greatest terror, waiting every moment for the deep tones of the bell, which vibrated through his whole frame and sent a shudder to his very soul. He tells me nothing would give him greater delight than hearing that it had followed the fate of its predecessor.

In another case, that of a young lady, of a melancholy temperament, and suffering with various nervous symptoms, a very similar effect is produced. On inquiring of her mother what her peculiar symptoms were, and whether she ever cried without cause, she stated very reluctantly that her daughter sobbed like a child when she heard the Victoria Bell. Her emotional tendencies were so great, that the plaintive notes of "Big Ben" during the solemn stillness of the night were more than she could bear.

Since this, I have heard of a young man who, suffering from similar nervous symptoms, has endured great aggravation of his disease through this awful bell.

I myself do not dislike the note; but if the weak nerves of invalids are to suffer in the way I mention, "Big Ben" will have much to answer for. I should much like to know the experience of other Medical men; for if they could cite cases in a like proportion to my own, the amount of suffering endured every night in London and the suburbs through this bell must be something truly appalling.

I am, &c. M.D.
Southwark, September 24, 1859.

THE British Association has resolved to meet next year at Oxford, on or about June 27, immediately after Commemoration. Lord Wrottesley is requested to accept the office of President for the next meeting; and the following were elected Vice-Presidents:—The Chancellor of the University of Oxford; the Rev. the Vice-Chancellor of the University of Oxford; his Grace the Duke of Marlborough; the Earl of Rosse; the Lord Bishop of Oxford; the Rev. the Dean of Christ Church; C. Daubeny, Esq., M.D., F.R.S. and Professor of Botany; H. W. Acland, Esq., M.D., F.R.S. and Regius Professor of Medicine; W. F. Dinkins, Esq., M.A., F.R.S. Savilian Professor of Astronomy. Professor Walker has been elected General Secretary in the place of General Sabine, who resigns the office; and Professor Phillips was re-elected Assistant General Secretary.

THE *John o' Groat Journal* says:—"There is no longer room for doubt that the disease of which several persons died last week and this is Asiatic cholera. All the usual symptoms have been discovered. As is always the case when that disease is prevalent, there is at present a good deal of ordinary sickness in the town. The certain cases of cholera have been about sixteen in number, of whom ten have died, four of these having been reported last week. Several are still ill. The disease has also broken out in Freswick, where three cases have occurred, one of which has proved fatal. At Kilmster also a case (still ill) occurred on Monday among the harvest workers, and it has given rise to considerable excitement in that district. During the week a person who had been seized with cholera was brought into the town from Reiss."

MEDICAL NEWS.

APOTHECARIES' HALL.—Names of gentlemen who passed their Examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 15th September:—

CRESSWELL, ALFRED, Ballarat, Australia
DOWELL, ROBERT, Hinderswell
LEACH, JAMES, Shaw, near Oldham
NUNN, JOHN ROBERT, Bedford
RUMMIN, GEORGE, Bath
THOMPSON, ABRAHAM, Gosforth, Cumberland
TREND, THEOPHILUS WILLIAM, Bridgewater

Also, on the 22nd September:—

BISHOP, THEOPHILUS, Buntingford, Herts
LYSTER, CHAWORTH EDWARD, Liverpool

The following gentlemen on the 15th September passed their First Examination:—

GAYTON, WILLIAM, Spitalfields
PECHEY, WILLIAM CRISP, Walthamstow

Also, on the 22nd September:—

BUTLER, THOMAS MAPLESON, Guildford
SCHOLLOCK, THOMAS JAMES, New Bridge-street

As an Assistant,

NICHOLLS, THOMAS FRANCIS, Strefford, Salop

APPOINTMENTS.

BRACEY.—Mr. Charles James Bracey, son of Mr. Bracey, Surgeon, was appointed Medical Tutor of Sydenham College, Birmingham, on the 10th ult.

EROMS.—Mr. Caleb Eroms, late Honorary Surgeon to the Great Northern Hospital, was appointed, on the 14th ult. Resident Medical Officer to the Birkenhead Hospital.

DEATHS.

ALISON.—September 22, at Woodville, Colinton, near Edinburgh, William Pulteney Alison, M.D., D.C.L., Oxon. F.R.S.E., and Emeritus Professor of the Practice of Medicine in the University of Edinburgh.

BARRY.—On the 17th May, at Sydney, New South Wales, Dr. J. C. Barry, late Surgeon of the Peninsular and Oriental Company's steamer "Columbian."

CHABERT.—On the 29th August, at New York, Dr. Julius Xavier Chabert, aged 67.

CRAIG.—On the 5th Sept., at Broom Park, Denny, Stirling-shire, John Brownlee Craig, L.F.P.S. Glasgow, 1847.

CULLENAN.—On the 27th August, at Freshford, Kilkenny County, James Cullenan, M.D. St. Andrew's, 1822; L.S.A. Ireland, 1827.

ELMORE.—On the 16th August, at Caledonia, Grand River, Canada, Christopher Elmore, M.D., late of Cork County, Ireland, aged 74.

GRUNDON.—On the 28th August, at North Frodingham, Yorkshire, Mark Grundon, (in practice prior to 1815,) aged 69.

HALFATTI.—Recently, at Vienna, Dr. Halfatti, formerly Physician to the Duke de Reichstadt, aged 82.

HARVEY.—On the 28th July, at El Dorado City, Dr. G. C. Harvey.

HOLMES.—On the 3rd September, at Cardiff-road, Newport, Monmouthshire, Edward Robert Holmes, aged 41.

KEELEY.—On the 31st August, at Port Stanley, Canada, Thomas C. Keeley, M.D.

LILLO.—On the 9th September, at Hartlepool, Thos. Lillo, aged 78.

McCHEANE.—May 16, at Lyttelton, New Zealand, Thomas McCheane, M.D., coroner of the district, aged 37.

MAY.—On the 29th July, at Sacramento, Henry Burbeck May, M.D., aged 42.

NICHOLSON.—On the 15th September, George Nicholson, of Ripon, Yorkshire, L.S.A., 1823.

PADDOCK.—On the 11th August, at Kingston, King's County, Canada, Dr. Ading Paddock, aged 72.

PATES.—On the 7th September, Charles Pates, of Exeter, M.R.C.S., aged 36.

RAYNER.—On September 18th, in the 60th year of his age, Thos. Ingham Rayner, of Birstal, near Leeds.

DE LAPEYRONIE and **BARTHEZ** are to be honoured by statues at Montpellier.

DR. BOND has been elected Dean of Faculty of Queen's College, Birmingham.

M. MARC D'ESPINE, of Geneva, has been nominated Chevalier of the Legion of Honour.

THE Queen has given 1000 guineas towards paying off the debt of the Royal Botanic Institution of Glasgow.

BARON LIEBIG broke his leg at Passau on the 5th ult. We are happy to learn that his cure progresses favourably.

M. BAMBERGIO adds his testimony to that of others as to the use of collodion in rendering small-pox pustules abortive.

It is said that Professor Liebig has found out the way to impart to ordinary tobacco the flavour of the finest Havannah.

A NEW journal has just sprung up in Madrid; it is devoted especially to diseases of the eye, of the skin, and to syphilis.

DURING the last three weeks, three cases of death from burning, resulting through the exorbitant use of crinoline, have been reported in the journals.

MR. HUGH MILLER'S Museum has been preserved to Edinburgh. Government pays £500, and the public subscribe another £500, for its purchase.

THE Duke of Newcastle has presented an harmonium, of the value of upwards of £60, to the Lunatic Hospital, Nottingham, for the entertainment of the patients.

THE Prince of Wales has been regularly enrolled as a Student of the Edinburgh University; has duly signed the obligations, and received his Matriculation ticket.

As a "sign of the times" it is worth noting that a "*Revue Spirite*" has been established in Paris, and contains reports of table-turners, spirit-rappers, and such-like raggamuffins.

CANCER of the lips is so common, we are told, at Montpellier, at the Hôpital St. Eloi, as to be the most frequent cause of operations there. M. Bouisson attributes the disease to smoking.

M. CHEVREUL says that Dr. Berkeley, Bishop of Cloyne, was the first person who especially called attention to pitch water as a remedy, in 1744. It appears that in his time the remedy was much used in the West Indies in small-pox.

MR. G. BIGGS, late publisher and bookseller in the Strand, has left, among numerous other legacies, £100 to each of the following Hospitals:—Charing-cross, Westminster, King's College, Consumption, Cancer, and Royal Free.

THE Electro-Chemical Baths of M. Pennes have, after experiments, been admitted into the Imperial Asylum of Vincennes. M. Pennes, during the last four years, has furnished gratuitously 9500 doses of his salt to different Hospitals!

"ALL the great heresies of modern practice," says M. Gibert, "arise from the fact of pathological doctrines being applied to therapeutics. Our best remedies we have learnt from the savage, and they act we know not how. Experience rules supreme, and must be consulted especially."

M. KERGADEEC informs his Academy that Dr. Pitta, a Madeira Doctor, has made some modifications in the stethoscope, which are of great utility, improving the instrument considerably. M. Bouillaud, who has tried the said modified instrument, confirms the praises of it, and hopes that it will become generally adopted.

At the meeting of the British Association at Aberdeen, the Brisbane Medal of the Edinburgh Royal Society was presented to Sir Roderick Murchison by a deputation, consisting of Professors Christison, Allman, and Balfour, and Mr. R. Chambers. The honour was conferred upon Sir Roderick more immediately for the services which he has performed in the Scottish field of geology.

PROFESSIONAL SQUABBLES AND THEIR MODE OF SETTLEMENT IN AMERICA.—A shooting affray took place at New Orleans, on the 29th, between Dr. Foster and Dr. Choppin, Physicians attached to the Charity Hospitals. Professional jealousy was the cause. Dr. Choppin was dangerously wounded.

A GERMAN DOCTOR, of Anhalt-Koethen, has been in the habit of administering the vaccine to children *internally*; and then giving certificates of their having been duly vaccinated. The authorities have at last got wind of the fact, and have threatened to prosecute him if he gives any more such certificates.

CYLINDER BALLOON.—M. Lassie has read to the French Academy a memoir on what he considers to be a complete solution of aerial navigation. He subjoins an account of the aerial ship, which is a long horizontal cylinder, terminated by two hemispheres, its length being covered with several helices. The length of the cylinder—about 120 inches—is at least ten times its width. By the apparatus supplied, M. Lassie believes himself to be able to steer his vessel through the atmosphere.—*Cosmos*.

The quantity of nicotine in tobacco varies much according to the locality from whence it is taken. From Havannah tobacco 2 per cent. is obtained; and a like quantity from Maryland and Virginia; from Alsace tobacco 3 per cent.; from tobacco *du Nord* 6 per cent.; and 8 per cent. from tobacco *du Lot*, and from Algeria. Hence it seems that the cheapest tobacco contains the greatest quantities of irritating matter, and we get, it is said, an explanation of the frequency of cancers of the lip in the southern districts of France.

POISONING from tobacco externally applied was observed in the following case. A countryman, troubled with the itch, applied for a cure to an old wife. She prescribed frictions of snuff in olive oil. Soon after the liniment was rubbed in, the man was seized with vertigo, headache, pains at epigastrium, and incessant vomiting. His extremities were cold, and his forehead covered with sweat; general trembling, and faintings. Dr. Massina, who was then called in, gave the man ammonia, applied sinapisms, and made him vomit anew; then acetate of morphia and belladonna were given; and, *post hæc* or *propter hæc*, in two hours the accidents disappeared.

A FRENCH DOCTOR who can cure consumption—one M Thiercelin—speaks thus of Sydney:—"Everyone knows that England is the country elect of phthisis; and everyone knows also that Australia has been peopled in great part by the classes of society most disposed to phthisis. Well! I lived six months at Sydney, the capital of Australia, and I searched for phthisiscals, and scarcely could I find any. Everywhere around was a population vivacious, and in brilliant health. More than this, mothers who had lost their children in England through phthisis and scrofula, here give birth to a new family, numerous and luxuriant in form. The influence of hereditary disease had disappeared under favourable circumstances." We should add that the Doctor's curative agents are salt and heat. That is, chloride of sodium and a warm climate.

M. DEVERGIE has asserted that the acarus is not always the cause of itch, but sometimes its consequence; there is nothing, he says, which disproves the possibility that the products of secretion, the atmosphere around those affected with itch, their clothes, &c., may give rise to the animal. This assertion has been refuted by M. Piogey, as the results of his observation, at St. Louis Hospital, of 300 cases:—"1. The acarus is never a morbid product of the eruption; does not arise spontaneously; it is the sole and necessary cause of itch. 2. The mode of contagion of the sarcoptes is invariably the same, when due precaution is taken. 3. The vesicle arises under the influence of local irritation, ordinarily of a bite; other eruptions are merely complications of different forms of the disease, connected with its duration, etc."

MESSRS. SAVORY AND MOORE have invented a new Medical Pannier for the field, and in future all panniers supplied to troops are to be made on their model. Strapped upon the mule's back they appear as two common waterproof trunks of ordinary size. You unloose a belt, open a lid, let down a flap-side, and there is disclosed a whole magazine of drugs, Medical comforts, and surgical instruments, so arranged—and this is a point of great importance—that each article may at once be had without disturbing its neighbour. Here everything has its place and is in its place. In those compartments

are drugs enough to kill a regiment. In that drawer are corkscrews, knives, scissors, weights and scales; in another nests of pill-boxes, corks, measures, pestle and mortar, ligatures, needles, wax, tape, pins, packthread in a third, Surgeons' sponges; in another oiled silk, gutta percha tissue, and oiled paper. There are tin cases, all handy for use, containing field tourniquets and screw ditto, lint, carded cotton, and yards of plaster. A wallet, placed "quite convenient," is rich in linen sheeting, calico, and India-rubber sheeting. Here we have tempting stores of tea and sugar, cocoa-milk, arrow-root, concentrated beef-tea, and brandy, and, of course, the means of cooking them. There is an enamelled counter for making of pills; and by a simple contrivance, each pannier being furnished with a double lid, an operating table is extemporized. The panniers also weigh 20 lbs. less than the regulation weight for a mule's back, viz., 180 lbs.

VITALITY OF TOADS.—M. Victor Legrip, of Chambon, has transmitted to the editor of the *Cosmos* an account of various experiments on this subject. M. Legrip put some toads in chambers hollowed in the earth to the depth of sixteen inches, placing them on a tile, and covering them with a pot. Others were immured between two discs of glass in plaster cells, without access of air; and some were imprisoned in masses of mixed plaster, which touched every part of them. The first were examined monthly, and exhibited no marks of decay till towards the twelfth month, their excretions being retaken as nutriment. They lived thus, on an average, for twenty-three months. The second lot, examined through the glass, presented the following phenomena:—Abundant excretions of the debris of insects and larvæ; torpor while in darkness; sparkling of the eye at the approach of light; powerful efforts to escape; progressive emaciation till death, which took place generally after fifty-six days. Among the third class some toads were living after twenty-eight months of absolute sepulture. These facts prove that the toad can live a long time without aliment or aëration; he lived longer in the chambers where his movements were unimpeded, than in the cells where he could hardly change his position; but his life was very much longer when he was completely embedded in the plaster. Not being able to move, he lost nothing; and thus it will be easily comprehended that alimentation was much less necessary, and that his life, as if suspended, might continue for an indefinite period. M. Legrip states that toads are not only inoffensive, but exceedingly useful in gardens, and that he is not at all surprised at the increasing commerce in these animals, who live exclusively on worms, caterpillars, and insects, great and small, and are thus the protectors of a host of useful and ornamental plants. Market gardeners will find them invaluable.

VITAL STATISTICS OF LONDON.

Week ending Saturday, September 17, 1859.

BIRTHS.

Births of Boys, 886; Girls, 866; Total, 1752.
Average of 10 corresponding weeks, 1849-58, 1571·8.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	544	514	1058
Average of the ten years 1849-58	621·0	622·8	1243·8
Average corrected to increased population
Deaths of people above 90
Deaths in 15 General Hospitals	34	12	46

DEATHS IN SUB-DISTRICTS FROM EPIDEMICS.

	Popula- tion, 1851.	Small pox.	Mea- sles.	Scar- latina.	Diph- theria.	Whoop- ing- Cough.	Dia- rrhœa.	Ty- phus.
West	376,427	..	3	5	1	2	3	4
North	490,396	5	4	21	2	2	12	12
Central	393,256	3	2	7	..	3	5	8
East	485,522	6	3	31	3	3	22	7
South	616,635	9	2	19	5	3	19	10
Total	2,362,236	23	14	83	11	12	61	42

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29·652 in.
Mean temperature	56·5
Highest point of thermometer	67·1
Lowest point of thermometer	48·0
Mean dew-point temperature	50·2
General direction of wind	S.W.
Whole amount of rain in the week	0·64
Amount of horizontal movement of air in the week	775 miles.

TO CORRESPONDENTS.

Dr. Young's reply to Dr. Gillespie is unavoidably postponed until next week.

Pater.—The queries shall be answered next week.

Medicus.—We have not the slightest idea to what "non-professional Quarterly" or "cudgels," our correspondent alludes.

What Next?—M. Blandet has really invented what he calls a *Métro-pompe*, which is to be used in affections of the uterus, and cure most of them by its suction power.

Statist.—There is reason to believe that a Royal Commission will be issued before the end of the year to inquire into the social condition of the mining population.

S. T. B.—Suicides are increasing in number in the North. It appears from statistics, that in France there are 10 suicides in 100,000 persons annually; in Belgium, 5; in Prussia, Sweden, and Norway, 11; and in Denmark, 26.

Students.—There are no special works on Naval Surgery. Ballingall's Military Surgery and Hennen's Medical Topography should be read. The examination for Naval Assistant-Surgeons is not competitive. Dr. Bryson is the examiner.

D. P.—In accordance with the results of four experiments performed by Dr. George Scott on dogs, we are forced to believe: *That in the dog, at all events, after the administration of large doses of calomel, there is a diminution in the amount of fluid bile and bile solids secreted.*

Tattoo.—M. Schul, having successfully performed a cheiloplastic operation, found that the edge of one lip was wanting in its natural colour. He therefore tattooed it with cinnabar, and now finds—one year and a-half after the operation—that the lip has not yet become pale.

[ERRATUM.—In No. 480, p. 270, for Henry Ussher, B.A., M.A., read M.B.]

INVETERATE WARTS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Can any of your correspondents inform me, through the medium of your valuable Journal, the best and most effectual remedy for the eradication of a crop of inveterate warts on the hand, I have tried the various caustics usually employed for their destruction, but as yet have not met with anything effectual for their total annihilation.

I am, &c.

A CONSTANT SUBSCRIBER.

WATERS AND HIS GANG.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Allow me, through the medium of your valuable Journal, to acknowledge the receipt of £5 5s. from the London Medical Registration Association, on behalf of Benjamin Thomas Jones, the prosecutor of the notorious Dr. Waters and his gang. The above handsome donation making the subscription up to £21.

I am, &c.

SAMUEL E. SMITH.

"NEW TREATMENT OF HYDROCELE."

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I find that a typographical error has occurred in the rendering of my communication on the use of the wire seton in hydrocele, which was inserted in the last number of the *Medical Times*.

Instead of *two*, it should be *ten* iron wires, which were employed to make the seton.

The wire employed was the thin wire used for sutures, No. 29 of the wire gauge, the same as that recommended by Professor Simpson.

I am, &c.

JAMES GILLESPIE, M.D.

Edinburgh, 45, Castle-street, Sept. 13.

"THE "L.R.C.P." AND ITS VALUE.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—As a constant subscriber to, and reader of, your valuable Journal, will you state in your Notices to Correspondents, the value (independently of the honour) of becoming a Licentiate of the Royal College of Physicians even in this "Year of Grace." Registration effects equality of Practice, and what advantage therefore, may be expected to accrue from the additional title, the expense of which, as a hard-working member of the Profession with a large family, I for one should be glad to avoid?

I am, &c.

M.D.

OXALATE OF CERIUM IN THE TREATMENT OF ASIATIC CHOLERA.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—As in the treatment of spurious pregnancy, or pseudocyesis, the oxalate of cerium is proved to be a very valuable remedial agent in combating against the violent and excessive vomiting that sometimes occurs, may I take the liberty of suggesting to the Profession the trial of the

same Medicine when endeavouring either to allay or to check the vomiting that frequently attends some of the worst forms of Asiatic or spasmodic cholera? In this disease, too, it might be found advantageous to administer it, both by the mouth and also by injection (per oram et anum); and, say, about one grain every quarter, or half-an-hour, until it has succeeded in arresting this formidable symptom.

I am, &c., WILLUGHBY ARDING, M.D.

Gothic-cottage, Wallingford, Sept. 22, 1859.

MORE ADVERTISING.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—The enclosed specimen of Medical Advertising (an extract from a Hull paper), is I thin worthy of a place in the next number of your valuable publication.

Sept. 9, 1859.

I am, &c. A CONSTANT READER.

"DRIFFIELD.—THE ECRASEUR.—This modern French surgical instrument (invented by the celebrated Chassaing), which has only been recently introduced into English surgery, was successfully applied for the removal of a cancer of the tongue, at Langtoft, in Driffeld, on Sunday last, in the person of James Lawty, a bricklayer, and the cancer, together with about half the substance of the tongue, removed with scarcely the loss of a spoonful of blood. The operation was skillfully performed by Mr. H. L. Atkinson, formerly of York, and recently returned from Paris, assisted by Mr. T. P. Atkinson and Dr. Bell, and up to the present time the patient is going on quite favourably. The sufferer, who is a poor man with a large family, has been liberally assisted with many comforts and requisites by Lady Sykes, which otherwise he must have greatly felt the want of. He had previously been dismissed from the hospitals as incurable."

RIGHTS OF M.D.'S

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In your number of the 27th ult., a writer, under the signature of "Not an M.D." asks, What qualification has the holder of a Degree conferred by an English or Scotch University? Although I cannot profess fully to answer this question, I have thought that the following extract from the Degree of M.D. granted by a Scotch University may be so far satisfactory:—

"Eique potestatem damus plenissimam de re Medica, legendi, docendi, consultandi, scribendi, et disputandi; in cathedram doctoralem ascendendi; omnes denique tum theorio Medico quam praxeos artus ubique terrarum exercendi et omnes simul honores, prerogativas omnes et concedimus et privilegia quo vero Medico Doctori usquam gentium conceduntur aut concedi solent."

The Charter of the Queen's University in Ireland, also provides, that those who obtain Degrees from said University, shall be fully possessed of all such rights, privileges, and immunities, as belong to similar Degrees granted by other Universities or Colleges, and shall entitle the persons on whom they may be conferred, to whatever rank and precedence is derived from similar Degrees granted by other Universities.

From the above extract it would appear that the holder of a Degree from either of those Universities had certainly the right to practise before the passing of the New Medical Act, which right has been recognised by the Act.

September 19, 1859.

I am, &c. M.D.
